FARM ECONOMY.

Grass-Burner, the Mennonite, (3 Ills).....312

FARM TOPICS.

Cellar, ventilation of.....650
Drainage.....422, 451, 538
Drain-Gauges at Rothamsted, different.....471
Draining, ridges for surface....551
Farm, experimental at Rothamsted.....473
— lakes.....661
— life, romance and reality of.309
— scenes, Contentment.....625
Fence (3 Ills.).....326
— for overflowed lands.....184
Gate, a cheap and convenient..363
— — novel and useful farm....559
— latch for.....184
Homestead, sanitary arrangements for the (9 Ills.)..693, 745
Lawes, John Bennet.....821
Plowing.....614
Soil, imperfectly harrowed.....551
— surface heaved by a light frost.....551
— — slit by a deep frost.....551
— well harrowed.....551
Sowing broadcast.....551
— drill.....551
Stake for corn-stalks.....589

FIELD CROPS.

Elusine Coracana.....697
Grass, Hungarian, Setaria Italica.....697
Potato, Beauty of Hebron.....710
— culture (3 Ills.).....310
Millet, Common, Panicum Miliaceum.....697
— Pearl.....693
— — in fruit.....695
Reana Luxurians, "Teosinte".695
Wheat, Defiance.....710
— Spring.....581
— vigorous plant in the fall..551
— young plant.....551

FLORICULTURAL.

Aquilegia Chrysantha.....718
Beaucarnea Recurvata.....249
Carpet bedding.....311
Dicentra Spectabilis, Bleeding Heart.....113
Dipladenia Williamsii.....9
Eryngium Leavenworthii.....712
Eulalia Japonica var. Zebrina .181
Flowers, vase of, after Van Huysum.....69
Geranium Sanguineum.....713
Propagation, summer.....487
Ricious, "Rural Bronze".....720
Yucca Filamentosa.....720

GARDEN.

Melon, "Exquisite".....8
Okra.....294
Potato, Beauty or Hebron.....710
Tomato, Acme.....103
— Golden Rural.....709
Salsify.....247

HERDSMAN.

Barn, a convenient dairy.....757
Bull and Cow, Uncle Tom and Isis, Holstein.....185
— Herefords.....455
— Prize Charolaise.....519
— shown at Paris, Italian.....745
Cattle Show, prize winners at Club.....37
Champion Hereford.....436
Countess and twins.....743
Danish Cow, a prize.....649
Duchess of Genova, 10th.....5
— — Oxford, 21st.....744
Duke of Oxford, 44th.....744
— — — 45th.....745
— — Wetherby, 5th.....743
Gipsy Lad.....455
Jersey Luna.....455
— Golddust, 2134.....437
Lady Carew, 3d.....645
Royal Havoring, 2d.....743

HORSEMAN.

Auburn Horse, the.....182
Bit, a home-made.....118
Cassius M. Clay.....134
George Palmer.....134
Goldsmith Maid.....332
Horse, an Arabian.....485
Stallion, King of the East.....89
White Major.....205
Young Pocahontas.....280

HORTICULTURAL.

MOORE'S RURAL NEW-YORKER.

RURAL AND HOME AFFAIRS. ARTS, SCIENCE, LITERATURE, NEWS, MARKETS, ETC.

VOL. XXXVII. No. 1.
WHOLE No. 1458.

NEW YORK CITY. JAN. 5, 1878.

PRICE SIX CENTS
$2.50 PER YEAR.

[Entered according to Act of Congress, in the year 1877, by the Rural Publishing Company, in the office of the Librarian of Congress at Washington.]

The Herdsman.

THE TENTH DUCHESS OF GENEVA.

It is just about a year ago that the Tenth Duchess of Geneva died. A sketch had been taken to enable the taxidermist to "prepare her head as a trophy" with some degree of truthfulness, and this sketch, as reproduced by the London Graphic, is copied above. There have been few more famous cows. The Eighth Duchess was actually sold for $40,600, but that was owing to a misunderstanding, and there was some compromise, and though Mr. Campbell got the full sum, the cow really sold for only $30,600. The Tenth Duchess, however, sold for $35,000 cash, which is the highest price ever actually paid for any cow. This cow was the eleventh in direct line from First Duchess by count (145), the cow bought by Mr. Bates at the Calling Sale in 1810 for 183 guineas. Tenth Duchess was sold at the Campbell Sale, at New York Mills, near Utica, in 1873, bought by Earl Bective, and sent to England. She produced in this country the Third Duke of Oneida, the Sixth Duke of Oneida, and Eighth Duchess of Oneida; and after going to England the Duke of Underley, the Duchess of Underley, and Duchess of Lancaster. The last three, with the Duchess of Oneida, are still in the herd at Underley.

The personal and family history of the "Tenth Duchess" is somewhat remarkable. Tradition ascribes the origin of the family to a breed of cattle possessed for centuries by the family of the Duke of Northumberland; but the actual records commence in the last century, when an ancestress of this cow passed into the possession of Mr. C. Colling of Ketton, Durham, England, who was one of the founders of the Short-Horn as a distinct and highly improved breed. In 1804 Mr. T. Bates of Kirklevington, Yorkshire, purchased one of the "Duchess" cows, and recognizing in her excellence and that of her male offspring the superiority of the family over the Short-Horns he had previously owned, he determined to obtain more of the sort, and at Mr. Colling's great sale in 1810, when 47 animals of both sexes and all ages, from 11 years downwards made the then unprecedented average of $700, he gave $925 for the two-year-old heifer "Young Duchess," afterwards called "First Duchess," a daughter of "Comet," ($5,000), and grand-daughter of the cow he had first purchased.

From that heifer, in the female line direct, sprang those "Duchesses" which have at different periods won the chief honors at agricultural shows, and for many years past commanded the highest prices at public and private sales.

Mr. Bates, while practicing to a considerable extent the system of "in-and-in-breeding," crossed his Duchesses, at different times, with other approved Short-Horn families, notably with those of Mr. Colling's Red Rose and Princess, thus combining what he considered three of the oldest and best Short-Horn families in the Kingdom. In 1853, at the Tatworth sale "Sixty-sixth Duchess" was bought, by Pecar & Morris of New York, for $3,670. Her descendants having changed owners in this country were finally dispersed by auction in 1873, when "Tenth Duchess of Geneva" was bought by Mr. Berwick for Earl Bective for the marvelous figure above mentioned.

She had here bred the bulls "Third Duke of Oneida," "Sixth Duke of Oneida," and the heifer "Eight Duchess of Oneida" bought also for Lord Bective, at the same sale, for $15,000. Her progeny in England are enumerated at the opening of this condensed sketch.

HOW TO ORGANIZE A STOCK FARM.

Some people are complete muffs at the undertaking, having no decision of character and no discernment as to the merits of one plan of buildings over another, and no judgment whatever to guide them in the selection of live stock. They will consult with various people, and be swayed one way and then another, till they get a medley of ideas, which produces confusion worse confounded than any in the brain of the hopelessly insane.

Having to purchase the animals of every variety, the first consideration,—after having put all the fences in such thorough repair as to prevent a possibility of any breach being made by unruly cattle, and after having provided good stabling for whatever requires keeping up,—is to select with care the cattle, sheep, etc., required, from such breeds as will answer the purposes for which they are intended. A great deal depends upon this first selection, for, as the ancestors of the purchased cattle or sheep were, so it is probable the progeny will be—consequently there are flocks and herds from which the worst creatures among them would breed better stock than the very best picked out of another lot. In addition to using every caution and being very particular about the foundation of the future herds and flocks, a good sensible system of rotation of crops should be acted on, in which course of cropping there should be every kind of food necessary for the prosperity of the different varieties of stock. Many Americans are totally ignorant of the great advantage attending system and forecast. These are the men who practice what they call economy till their cattle and sheep die of slow starvation, very few farmers here having any knowledge of high farming. But the high feeders who have well-bred stock gain every way, for they save a year in getting their young stock into selling condition, and bring their heifers into milk a year earlier, while their fat stock, being always of No. 1 quality, secures an extra price.

In commencing to run a good farm, it is also wise to choose the best and most trustworthy laborers that practical knowledge can enable a man to select, and then, when all is once straightforward, it is comparatively very pleasant to get along.

Imagine the difference between the condition of a man who has erected his barns in accordance with the opinions of a number of people, who has laid in a stock of cattle and sheep by yielding to the judgment of a man who does not know a thorough-bred from a grade; then picture to the mind another man who has judiciously commenced with horses, cows, sheep, hogs and poultry, of which not one among all the varieties but was undoubtedly descended from a long line of valuable ancestors, and who grows crops to feed so as to bring out every good quality, and who has barns which afford every comfort and convenience. A Working Farmer.

TENTH DUCHESS OF GENEVA.

A BARN FOR STRAW.

W. J. FOWLER.

One of my neighbors, an excellent farmer, proposes to build next season a barn 30x40 feet with 20 feet posts exclusively for storing straw. It will be built where the present stack stands, and he believes that the size named will be large enough to hold most of the straw on his 150 acre farm. What the barn will not hold may be stacked outside as at present. His idea is to keep the straw under cover and thus have it always easily accessible and in good condition for feeding. He believes that it will pay besides being a great convenience for wintering stock. The straw-barn will be set on a wall eight or ten feet high furnishing a basement which will give suitable room for horses and cattle in winter. In the center of the building or at one side there will be a tube, three feet or more square, through which straw may be thrown into the basement.

The upper part will be one room enclosing a solid mass of straw—forming in fact an enclosed stack. An outside ladder with doors on the side of the building at different hights will furnish means of ingress. The straw will be run by the carrier from the threshing-machine through one side of the roof, and be packed by "stackers" inside. Getting the straw inside so high a barn, is probably where my friend will find his chief difficulty. With the basement, the roof will be twenty feet or more from the ground. His barn, however, is on a side-hill, with basement under the grain barn, so that the stock will be on ground twelve or fourteen feet lower than the threshing floor.

With plain heavy wall and no inside compartments to the upper barn, the expense need not be large. The basement should be divided, both for convenience in keeping different kinds of stock and to strengthen the building. Such a structure is adapted to side-hills and sheltered locations, rather than to the level wind-swept prairie regions of the West.

One of its best features—the barn basement—may be secured by building the wall and stacking the straw over it. To save the wall from freezing, it should be protected from wet by a roof or by building the straw well over it. In a cheaper but excellent way, the same advantage is secured by extending straw stacks over rough sheds, furnishing comfortable shelter through the season, though at the expense of the straw. However, in many sections straw is of so little value that this loss is scarcely appreciable.

In some way a good supply of straw may always insure comfortable winter quarters for farm stock, and whoever lets animals suffer while plenty of straw and rough boards are at hand, is inexcusable.

The plan for saving straw in an inclosure built expressly for storing it, is only adapted to localities where straw is scarce.

Farm Topics.

JOTTINGS AT KIRBY HOMESTEAD.

BY COL. F. D. CURTIS.

MISTAKES are teachers. When we looked over our sheep early in fall we found five ewes which we thought ought to be turned off. They had been such excellent mothers that they had been kept until two of them had lost their front teeth and the others were fully eight years old. The old ewes were put into a stable and a temporary rack made where they could be fed hay. There was a nice feed box for grain, and with a tub to hold drink, we said to ourselves "now we will fatten our sheep and have some first-rate mutton." We gave them plenty of clover hay,—the best kind of hay for sheep—and kept the tub full of water. No mistake about this. Then we began to feed them barley—about a gill each day. This was well enough, for we knew sheep must be fed only a little at first or they would get feverish and lose their wool, and perhaps get the scours. We had never stall feed sheep before. This was the way we had wintered them often, and they did well. The roots were not gathered or we should have fed them some turnips with the barley. By and by there was a load of corn ground in the ear to feed the pigs, and this meal we thought just the thing for our fattening sheep; so we commenced with the corn meal and as they ate it greedily we increased their feed to a quart each.

In a few days they all had the scours and before they got over it they had lost all they had gained and we lost all our trouble and feed. A neighbor offered us two dollars apiece for the four best ewes and we let him have them. With the one old sheep and a half dozen late lambs, we started another flock and another trial. They have been fed twice a day with corn meal, less than a pint each, all told. The old sheep is getting round and plump and the other day the hired man wanted to know when we should kill her as he wanted a quarter. Dividing the food into two messes, morning and evening, is a most capital idea, as the stomach does not get overloaded and then being a less quantity it is thoroughly digested. An animal will actually fatten sooner on a small quantity fully digested, than on a larger amount crowded into the stomach at one time. A pig may be fed all it will eat of concentrated food, but not so with a sheep or cow; grain must be fed to all ruminating animals in limited quantities. We once had a fat ox thrown into a chronic dysentery from which he never recovered, by being over-fed with corn meal. The man fed him six quarts twice a day, instead of once a day as we told him. Horses can be gradually fed up to a condition that they may be tied up to an oat bin and allowed to eat all they wish without injury, or the grain could be kept in the manger before them and they would only eat what they wanted. We have done so when horses were required to perform severe labor. It is a mistake to keep sheep, however useful they may be, until they are more than six years old. In fact as a rule, it would be better to fit them for the shambles at an earlier age. Old sheep take on flesh much slower than younger ones as the muscles are shrunken, all the tissues are more or less wasted and the blood thin and weak. Nearly the whole animal structure has to be renewed before they will fatten, and this is a cost which may be obviated by fattening when in full vigor. The same is true of old cows. It may be a question whether the advantages to be derived from these animals in the production of young do not compensate for the increased expense in fitting them for the butcher. This can only be so when the ewe is an extra good one. A sheep at four years of age has got its full growth, and after that produces a lighter fleece every year, unless extra care is had, and even then a ewe, after she has passed this age, will produce less wool annually. From these deductions and our own experiences, we are satisfied old ewes do not pay.

Many of our neighbors are letting their sheep run over the field and pick their living. They must be losing in condition, and besides they are injuring the meadows and pastures for another year. Sheep bite very close and when allowed to run in this way, they will eat off the crowns of the clover and other grasses. When this is done, the grass is apt to die, especially if the winter is an open one as this one bids fair to be. They get unruly, too, and next summer they will not forget it.

A box is a capital thing to put over a grapevine or any tender plant to protect it. When dirt is not desirable or handy or the vine is so shaped that it cannot be conveniently covered, a box is just the thing. Evergreen brush of any kind is also good and clean to use about the house.

The Ailantus tree has lost its popularity in the cities. It is not beautiful, but we believe its fame did not rest on this, but on a notion that it was healthy. Why, or how, we do not know. The odor of the blossoms is exceedingly disagreeable, and wherever they fall they make a great deal of dirt. It is a natural habitation for vermin, as silk worms are fond of its leaves. It may have had a charm on account of its oriental origin. We have been looking through all this and imagine we can see practical utility in its rapid growth and pungent wood. It will make good posts and rails. We have brought a score of self-seedlings, pulled up out of a little grass plat before a brown-stone front in New York, and, in an out-of-the-way corner on the farm they are planted. Here we will have an Ailanthus grove and wait and see if our imagination is not something more than a fancy.

We had a big heap of buckwheat straw which had been wet through and was partially rotted. It was in the way and against the warnings of Mr. PACKER and others, we had it scatte red over the rye. They said "it would smother the rye, better to spread it in the barn yard." The rye is on an exposed side-hill and needed, we thought, just this kind of a covering. It cannot smother it this winter and when spring comes why will not the buckwheat straw rot, and after serving as a mulch be so much manure to help the growth of the rye? Then, we save handling it over twice and this is quite an item.

A fine Derking rooster, weighing not less than six pounds, was dragged away by a hawk and killed. There has been a great deal of trouble with the depredations of hawks in the neighborhood this summer. The sly rascals sit quietly among the trees around the farm buildings and, watching their opportunity, swoop down with great force upon unwary fowls, catch them firmly with their claws, and carry them away with their wide-spreading pinions to some secluded spot where they tear them in pieces and feast to their hearts' content. They steal little chickens, and carry them to the tall tree tops where they have their nests, to feed their young. Guinea fowls are said to be an effective guard against hawks. When they see a hawk—and they seem to be more on the alert than other fowl—they set up a fearful screaching which either frightens the marauder away, or so puts other poultry on their guard that the would-be thief loses his game. We have never been without Guinea fowls until the past year, and this may account for the boldness of the hawks. We have now got a pair of Guineas to be prepared for next year.

NOTES FROM MAPLEWOOD FARM.

HECTOR BERTRAM.

WINTER is really upon us hereabouts. The smaller brooks are frozen over, and there is every indication that the change from mud and water is to be a permanent one. Older men prophesy an open winter—constant changes from cold to warm weather, and the opposite. We sincerely trust not; for such weather is very productive of sickness—the prevalence of contagious diseases. With many men who *style* themselves farmers, the season's labor ceases at this time, and during the winter months they surround the kitchen fire nearly all the time, save that required to hurry through their chores and procure fuel—such persons never have a supply furnished before cold weather sets in—and consider that this is all they have to do during the time that mother earth is covered with her mantle of snow. A very erroneous idea it is too. To the practical, painstaking farmer the winter months furnish ample opportunity for the maturing of plans, in accordance with which the campaign of the coming season shall be conducted. He knows when spring opens just what particular grain shall be sown on his land, how many acres he can afford to drain, what fences need repairing or rebuilding, and how many more important improvements can be accomplished. The tools are all overhauled, repaired, and covered with a good coat of oil, the harness is washed and oiled, and missing straps hunted up, or replaced with new ones. He will also look over the year's account of income and disbursements, and on the result base his calculations for the ensuing year. This added to the careful and systematic management of stock, will insure him ample labor for the winter months, and perhaps leave a balance of time in which he can compare notes with his neighbors, and glean many useful ideas from their experience. Such farmers are the ones that succeed, the ones who look upon farming as a profession, not a degredation, who are contented with their lot and happy. They are not the ones who complain that "farming does not pay," who desire to dispose of their farms to remove to town, who remain upon the farm from necessity not from choice, who will never succeed in any business however great their opportunities or advantages, and who are a great drawback to the advance of agriculture in this or any country. We have too many farmers in name only.

Mr. MARCY was telling us, the other day, of an experiment with corn and wire-worms, which,—could we attach as much importance to the experiment as did he—will prove of great worth to us poor mortals who have these wholesale destroyers of the corn-crop to contend with. As a drowning man will catch at straws, so we seize with avidity anything that promises to rid us of this pest. At planting time, the seed was soaked in soft-soap, until the grains were well moistened, then rolled in plaster until dry enough to separate easily. The grains sprouted even sooner than when planted after the old manner. As soon as the first shoots began to show through the ground, a mixture of lime, ashes and plaster, equal parts, was applied, a tablespoonful to each hill, directly upon the young plants. Mr. MARCY assured us that not a hill was troubled or injured in the least, although the ground was full of worms and a field adjoining, planted the year before, had proved a complete failure owing to their depredations. We shall try the experiment next season, ourselves, should we plant corn on ground where wire-worms are known to exist.

During a flying visit through the counties of Tioga and Tompkins, we saw many fields of winter wheat having a very large top for this season of the year. Some pieces were lodged badly, lying as flat as though a roller had been applied; while others had been mown to prevent its jointing this fall. We consider, on the whole, late sown wheat the surest. Many farmers pasture their wheat in the fall, turning on their sheep. This must prove injurious, as no animal is as destructive to vegetation as sheep. While a cow will gather the outside leaves, sheep with their narrow jaws and sharp teeth, take the very heart, and while the broad feet of the former will only, in a measure, disturb the surface, the sharp ones of the latter cut up and destroy many of the plants and transform the field—if suffered to remain long—into a mire-hole, especially when the season has been so rainy as the present one.

We raised a large quantity of pumpkins among the corn this season, and calculated that they would prove beneficial for milch cows, but after feeding nearly all of them, concluded that pumpkins would diminish rather than increase the flow of milk. We ceased feeding, supplying in their place corn-stalks, and the result proved conclusively that farmers should feed pumpkins to their young cattle, but reserve for milch cows all their stalks. A neighbor informs us that his cows went nearly dry before his crop of pumpkins was exhausted, but regained in a measure the accustomed flow when corn-stalks were substituted.

[Were the seeds taken from the pumpkins before feeding them?—EDS.]

A farmer of our acquaintance keeps sheep but to my mind is unwise in his management of them. We have often known them to be placed and left to remain for weeks in a pasture where no living water could be found, and obliged to depend upon the dew for drink—note the consequences. The sheep are poor, small-bodied, and thin-wooled. Those that formerly sheared five pounds of wool now shear two and three. This does not look to me like progress in agriculture. There is no animal—domestic animal at least—which will drink as often as sheep. Plenty of salt, a large range, and fresh water, they must have, to thrive. A barrel of salt secured in the pasture, one head removed, so that the animals can have free access to the salt, is our plan: others of course may think differently. We are safe at least in saying that the man who advocates the doctrine that sheep require no moisture save that obtained from the grass during the night or early morning, should not take upon himself the responsibility of their care. We have found beans to be the best of grain for sheep. They increase the weight and quality, I think.

We have learned a new mode of cultivating potatoes this season. A shallow furrow was plowed, in which the potatoes were dropped, two pieces in a hill, three feet apart. Another furrow covered them nicely. The third furrow from this was planted in a similar manner, and so continued, dropping potatoes in one furrow and leaving three until the field was plowed. They came up rather slowly but grew finely, and this fall showed a good crop. Rather the lazy man's method, some may say, but a very judicious one we think in a dry season. We always have planted and probably always shall plant our potatoes deep. They do not require as much hilling, and are not as liable to rot. A friend has a novel method of heading off the Colorado beetle. He plants alternate rows of corn and potatoes, claiming that the "bugs" cannot find the latter if thus planted. The plan seems doubtful to us, yet he says he is entirely satisfied with the result.

Gather the autumn leaves and mulch the strawberry beds. A little fine manure scattered over them will keep them in place and protect the roots of the plants.

AGRICULTURAL NOTES FROM CALIFORNIA.

WM. C. L. DREW.

NOVEMBER has come and gone, and half of December is nearly among the days that are past, yet the sky remains clear and bright, no sign of storm mars our spring-like days, the air so calm and still, has hardly enough motion for windmill purposes—such is the state of the weather in the home of the writer.

In October and the first week in November we had a few gentle showers, sufficient to lay the dust of summer, to start the plow in the mellow soil, and to cause dame Nature to put on her robe of green. With the first rains the California farmer brings forth his plow, and from that time to the following April it is constantly busy, now at work in the field, then in the garden, a short visit to the orchard, and so on until its work is done.

The grass in many places is nearly strong enough to give abundant feed to cattle: throughout the greater portion of California, the grass remains all through winter, green and fresh. Sowing of grain, principally wheat, barley and oats, commences as soon as the soil can be prepared in the fall, and continues to April or May, all through winter, and while our sister States of the East have on their robes of white. This season has seen an immense amount of grain sown in California. Many farmers looking for early storms, sowed their grain in the dry dust before the early showers; the grain thus sown in many sections of the State is in splendid condition; in many fields it already stands six or seven inches high, a perfect mat of green. Seed sown soon after our first showers, owing to the gentle weather we have since had, has germinated freely and quickly, and is now in splendid condition. The crop harvest of next season will be an abundant one, if the present condition is any criterion of the future.

But not to the farmer alone is this a busy season in California; the horticulturist and florist have also their work to do. Trees are to be transplanted, for this is the most propitious season for that work in our State. Blackberries, raspberries, strawberries and other small fruit must be trimmed and cultivated. To the florist this is a season of work; beds are to be prepared, fertilizers to be applied, perennials to be transplanted, stock to be increased, while many other duties demand his attention.

To make this a happy time, all that is now needed is a real good downpour; for this, however, there is abundance of time. Many complain about another hard season, but a good rain will relieve all apprehension.

El Dorado Cal.

Farm Economy.

FARM NOTES.

S. RUFUS MASON.

PAY OR NO PAY.

DOES such and such a crop pay, or does such a kind of stock pay? has become a standing query. Now Pay is the difference between a certain amount of outlay and a certain amount of income, and it is only when the income is the greater that it is said to pay. In all investments on a farm, it is very necessary to hold the money outlay in check, and make up the deficiency with extra care and brains. The slip-shod mode of management so common, never pays, and all "slip-shoddies"—to coin a new word—say that nothing pays, and it is only from that class that we hear the cry, "farming don't pay." A careful man makes everything pay; he bestows care upon every operation, and during every moment of that operation. His mind is totally given to his business, which he conceives to be to produce the best possible article. It is not the crop or stock that with some does not pay; it is the man that doesn't pay (attention understood, as we used to say in our parsing lesson). The fact is, when anything on a farm doesn't pay, it is because it has had no chance.

The moment a man finds that his labor doesn't pay, let him increase the amount of outlay in that line; that is to say, let him increase his capital by the addition of brains, care, perseverance and courage, and the pay will come.

Producing a great quantity of a thing overstocks the market; but producing a high quality always increases the number of buyers. The

market is short, the prices run up, and then "it pays."

FOUL STOMACHS.

Stock of every description, from overfeeding, want of change of food, and from scanty feed, get out of order, and the condition of the stomach is the first visible symptom. Charcoal is a corrector of all such incipient signs of disease, but in its usual state it is also the least palatable article that can be given to animals. In the North-west, where corn is so cheap as to be freely used as fuel, we have charcoal in a very palatable form. All kinds of farm animals eat it readily, and given once a week, it maintains a sweetness of the stomach of the most beneficial character. Those who burn corn, always have a full supply of part-burned grain of corn in the ashes, which they use as a corrective; but in the East, where corn is too costly for fuel, it will still pay to burn sufficient at times, to be used as a corrective. Poultry and hogs eat it to the last morsel, and thrive well on it.

WHEAT FOR FLOUR.

Many farmers grow only wheat enough to supply bread to their families, finding stock raising more profitable. To such, especially if they have a fancy for extra fine bread, there is a difficulty. Soft wheat does not make the best bread, neither does hard wheat. Now for all such, a mixed crop would seem desirable, as the best flour in all respects is made from the two kinds in about equal parts. The question then arises; what soft wheat ripens at the same time as some good hard variety? The two could be mixed together, and both be ready for the sickle at the same time. As this State only produces spring wheat, that is the only kind here in question.

SWEET CORN.

We are just getting in our crop of sugar corn for feed. We grow about fifteen acres of it, and find it the very best food for milch cows, mules, hogs, and poultry. It is not oily or heating, like yellow corn, is more fattening, and we have not an animal on the place that will touch the yellow if the sweet corn is to be had.

We plant April 25, begin to feed it green to cows and pigs by the first of July, have it ripe by August 1, and use it all the year round in preference to any other. This crop is but little known to farmers, but is the most valuable one grown for home consumption.

EARLY CUT HAY.

Prairie hay is seldom cut before September in this State. Of course, it is fully ripe, and often too old for milch cows, calves and young stock. This year it was convenient to cut about twenty-five tons in June, and although it settled and shrunk heavily, it is without exception the best hay for all purposes I ever saw; and it proves to be so good that the loss in quantity is more than made up in quality. I have also forty-five tons cut in the last of September and beginning of October, but it is not relished as well as the June cut. It will probaly, however, be very useful in the spring for hard-working teams.

THOUGHTS FROM A FARM.

LET THE FARM REMAIN UNKNOWN FOR THE PRESENT AND THE WRITER REMAIN INCOGNITO.

FARM SUPERINTENDENCE.

THINKING over the old truth that "a man cannot serve two masters," it would seem as if no man should arrange his business so that the workmen would have more than one over them. The thinker thinks if a man of means engages an agent to do business for him, there should be no interference with this man in charge, beyond telling him what views the principal takes of the general management, and what arrangements he desires to be carried out, and then let the business be done without any confusion and unpleasant consequences arising from two people giving orders on one estate.

It is thought many gentlemen are brought to be disgusted with farming in consequence of the number of men who endeavor to sponge upon them in the way of buying for them and persuading them to buy. Forty years ago, when the writer was a young man, many men tried to impose on him by this means, but he thought the whole fraternity were a set of leeches and used his own judgment, and in doing so could pick their flocks or herds the same as he would any other. There is not the least doubt about the miserable failure resulting from business conducted in accordance with the opinions of TOM, DICK and HARRY, or of the certainty of being robbed and cheated by drovers, for the cattle they have are almost always those sold by other people for some fault.

Agriculture can never be profitably and easily conducted till markets are established on the same plan as in England. There any man can find what he wants to buy, and there also any man can sell aught; but in the United States a man has to ride round a long way to find what he wants or go to city markets, a long way off, unless he does what is worse—orders or buys of the drovers, who invariably take advantage of farmers by sticking out for extra prices for the worst animals, which are less salable at the end of their journey, while those that are valuable they will tell you are bespoken or sold.

The Apiarian.

EGGS LAID BY QUEEN BEES.

MR. DOOLITTLE said, in his letter on bees, in the RURAL of Dec. 1st, 1877:—"A queen will lay about 700,000 eggs during her life-time, and usually lives four or five years; but under the present system of management we coax the queens to lay all these eggs in two or three years." And he claims that his great success in obtaining box honey is owing to his thus "coaxing" the queen bee to lay "700,000" eggs in two or three years.

Let us see if this can be done. He uses a hive with frames 10¾ inches square inside, and nine frames to a hive. This gives 1,930 square inches of comb, by rating the combs as 10½ inches square, which is all that they should be, practically. Now, it is right to estimate the space in which eggs are laid at *one-half* the superficial area of the combs, at the hight of laying, or 900 square inches; and as laying averages, not over *half* of this space, or 495 inches will be occupied with brood at *one time*. It takes twenty-one days for the brood to mature from the egg, and a full square inch of comb contains twenty-five cells, so that a queen produces, at most, only 13,250 bees in twenty-one days; and the time devoted to laying, in a season, is mostly from about April 15th to August 1st, or time enough to produce five broods, each of 13,250 bees, or, in all, 66,250; and I claim that this number is as much as queens can be made to average, with all the "coaxing" that can be devised. Bees are produced, more or less, from January to November, but as each generation is not of full numbers, the above estimate is a liberal one.

Now, according to Mr. DOOLITTLE, that a queen lays "700,000" eggs in four or five years, she would have to lay about 175,000 a year, as queens seldom lay much after the fourth year; and, on his "coaxing" plan, about 250,000 the first and second years, at least, as she must, under a high "coaxing" pressure, fall off considerably the third year. This great production of eggs I claim to be *impossible* for any queen to lay, under any circumstances, and particularly so in the hive that Mr. DOOLITTLE uses. A good-sized swarm consists of 12,000 to 15,000 bees, and the best average cannot exceed two such swarms. Then, allowing that as many more bees are reared in a season that remain in the hive till they die, we have 60,000 bees as the utmost average limit of annual laying, and about 240,000 during the life of a queen.

Mr. DOOLITTLE has sent me, at my request, a statement of the number of hives that he had each year, from 1873 to 1877, with the yearly product of honey, as follows:

1873, 29 hives	2,153 lbs.	honey.
1874, 50 "	3,691 "	"
1875, 46 "	4,878 "	"
1876, 65 "	3,550 "	"
1877, 67 "	11,177 "	"
257 "	25,222 "	"

According to this statement, he has averaged about 100 lbs. of honey per hive (mostly box honey), for five years, or a cash income of about $25 per hive yearly!

But there is another side to this matter. It appears that Mr. DOOLITTLE has been in the habit of counting in "practically" only his best families of bees. For instance, he admits that in June, 1877, he had 80 hives of bees, but "practically" only 67. Then he puts down his bees in 1876 at 65 families, while he wrote to the Bee-Keepers' Magazine, as per June No. of that year, that he had 99 families!

But I'll drop the subject now, admitting that even if Mr. DOOLITTLE did select only his best families to count "practically," he stands in the foremost rank of successful bee-keepers.

T. B. MINER.

Pomological.

THE PRIZE PLUM ORCHARD OF MICHIGAN.

PROF. W. J. BEAL.

THIS orchard belongs to J. G. RAMSDELL, Traverse City, and contains 700 trees, set twelve and a half by sixteen feet. Two hundred of those have been planted six years. Two hundred have been planted four years; and three hundred have been planted three years. They are all on plum stock. Very little pruning has been done. Some hoed crops have been planted and once a crop of buckwheat on a part of the orchard late in the season. The buckwheat appeared to injure the trees. For a part of the time, about some of the trees, Mr. RAMSDELL had sown half a bushel of hard-wood unleached ashes to a tree. These have produced an excellent effect in the color of the leaves, the growth of the tree, and very likely added to the quality of the fruit. This spring the ground was harrowed once, and then the weeds were allowed to grow except under the trees, where the ground was kept clean to make it easy to pick up the injured plums, as they fell. The owner usually cultivates quite late in autumn to aid in killing the climbing cut worms which are very annoying on his farm. To prevent worms climbing any of his young fruit trees, and eating off the buds, he places a circle of tin like a bottomless cup about the trunk. Each end of the strip of tin has a lock at the end, by which the ends may be locked into each other like two hands. The lower edge of the tin is pressed into the soil and the rest projects two inches or more above. The worms cannot climb the tin and they do not know enough to dig under. The trunks are clean, sound, and handsome. There are a few borers which are hunted with a wire and knife. They are cut out or punched to death. To keep away curculios, the fallen fruit is daily picked up and destroyed. He has tried the chip process, but does not think it worth using on his farm. He runs a hopper-shaped canvas under the trees and jars them with a forked stick placed here and there on the main branches. The jarring is begun as soon as he finds insects, and continued as long as he finds enough to amount to anything. There is no other orchard in the vicinity. He jars only once in about three days. The owner thinks that next year, the curculio may be kept in check, simply by picking up the fallen fruit. The insects work the worst on the thin-skinned plums, but would doubtless destroy all alike if there was no chance for a choice. Of varieties, he has most of Washington and likes it best; next comes Jefferson. If now planting a hundred trees, he would set twenty Washington, twenty Jefferson, ten Lawrence's Favorite, seventeen Bradshaw, seventeen Smith's Orleans, sixteen Lombard, thus selecting about equal quantities of yellow and purple varieties. From the two hundred oldest trees, he took, three years ago, about fifty bushels, the next year seventy-five bushels, this year the estimate was one hundred and fifty bushels on these two hundred trees. The average price at Traverse City, has been four dollars a bushel. The soil is generally sand and gravel, somewhat uneven on account of the hills and rolling surface. The sand abounds in small particles of lime; even the gravel contains a large per cent of limestone pebbles. Near one of the best trees, we dug down four feet, and found a reddish compact sand soon after leaving the surface. It is generally thought that clay on heavy soil is best for plums. Perhaps in the Traverse county with a climate so congenial to the plum, a clay soil is not so important as in warmer latitudes. Time alone will tell whether trees will thrive and bear to a good old age in this soil. There is certainly now every indication of health and proper growth, such as we should look for in trees expected to last for many a year. On another farm, not far away we saw three sound plum trees which we were told had been standing seventeen years.

Horticultural.

LICE ON WINDOW PLANTS.

WILLIAM FALCONER.

GREEN FLIES are extremely troublesome to most soft-wooded plants, as Pelargoniums, Pinks, Primroses, Heliotropes, and the like, as well as to the young and growing points and flower-buds of Roses, Bouvardias, Fuchsias, &c., and how to effectually rid ourselves of this pest, is a desideratum. I commend simplicity and energetic application—washing with soap and water and a sponge. Gardeners fumigate their greenhouses with tobacco trash to kill green-fly, and amateurs sometimes try it too, and scorch their plants; hence I advise ladies and others having a few window plants, not to fumigate them. Neither use whale-oil soap nor any other preparation whatever, because it will do little or no good but, perhaps, much evil. Take the fly-infested plant to the sink, lay it on its side, so that the pot may rest on the wood-work and the crops or plant be over the sink; then place a basin of clean water softened by common soap, under the crops, and with a sponge and plenty of water, remove every intruder. Turn the plant over and over, till it is certain not a fly is left, and if this washing be done carefully, calmly and earnestly, only the work of a minute, it is thoroughly effective and in no way deleterious to the plant. Now that the plant is clean, place it aside, away from the unclean, and take the rest, one by one, and wash them in the same way.

Don't turn on the water and hold the plant under the tap; that is a clumsy, injurious, and ineffectual plan. Neither use your hands as if a cat went a-fishing—afraid to wet your fingers; but roll up your sleeves and go to work with an energy worthy the cause, and in ten minutes you will accomplish as much and better work than you can in an hour by either the tap or clean-fingered policy.

SCALE.

If the plants be infested with scale, the sponge will erase them from the leaves, and a sharp-sided piece of wood or the back of a knife may be used to scrape them off the stems and branches, and a sharp-pointed—with the point a little dull, so as not to scratch—stick to fetch the tenacious vermin out of crevices in the bark and elsewhere, leaf-axils, and about buds. Use the sponge after the scraper. If there be any big brown scales that look dry, and from which, when you displace them, a shower of dust or "meal" (eggs) is scattered, be sure to remove these with the fingers so carefully as not to drop or disseminate an egg, and squeeze all out of existence between your finger and thumb.

THRIPS

are little black insects that suck the life-blood of plants, and do more mischief in a week than the same number of any other "flea" will do in a month. They breed innumerably and in little colonies on the under sides of the leaves. The young ones are green and yellowish-green. Gardeners fumigate them to death, or dip the infested plants in water impregnated with whale-oil soap and tobacco-water. If the mixture be not too strong and the plants be syringed with or dipped in clean water immediately afterwards, the cure is good, and no evil is done; but if the mixture be too strong, then the leaves suffer as if they were scared or blighted. Therefore, for window plants, I must recommend for thrips what I do for green-fly—washing with soap and water and sponge. At the sink this washing is good enough, but in the green-house it won't do, as many thrips would escape to propagate their species and perpetuate their work. Consequently, I would recommend in the case of greenhouses, where dipping or fumigating is not practiced, to bruise to death with the fingers every thrip that can be seen and wash after bruising. When fully matured, they are such hard little customers that the sponge won't kill the half of them.

MEALY BUGS

are known at a glance, and the washing method is the cure for them also. But I must advise that all their nests of eggs be squeezed between the fingers, so that none escape. Mealy bugs often secrete themselves about the leaf-axils, flower-heads, growing-points, or any interstice that may occur between the root and apex; and if there be any stakes or strings used, bugs will be there if they be anywhere. Then the stakes and tiers should be removed and replaced by new ones. The sponge cannot unearth the bugs when they get into crevices and between flower leaves and "down the throat" of some growing leaves, and then a bug-brush is necessary. A piece of stick like a pencil, with some hair wired to it in brush-fashion, is all that is necessary. A little paint-brush is not of much account—the hair is too soft. We want something stiff, like the hair of an old sweeping or hand-brush, to ferret the vermin out of their holes. Tobacco smoke has no effect on them. Diluted kerosene or alcohol is certain death to those it reaches, and in the case of Cactuses, &c., where neither sponge nor brush can sometimes reach the invaders, these liquids may be beneficially used; but for anything else, I denounce their adoption as slow work, and in unpracticed hands, also most dangerous work.

RED SPIDERS

are most minute and destructive insects that increase multitudinously, and voraciously attack Abutilons, Roses, Smilax, and some other plants, and are usually the result of failing health or a dry atmosphere. The cure is repeated sponging; and the prevention is occasional sponging, frequent syringings, and vigorous plant-growth. Gardeners employ powder-sulphur painted on the hot water pipes or on boards, slates, or walls facing the sun—but inside the green-house, of course—to help to destroy this pest, but woe to plants and insects alike, if the pipes get much more than milk-warm.

Now, supposing all our plants are newly-washed and perfectly clean; let the pots be washed too, and any "green stuff" on the surface of the earth they contain be removed, and drooping branches neatly staked and tied; then, after washing the window-sill or stand, replace our plants in position, and we shall be pleased with our hour or half-hour's work.

Cambridge Botanical Gardens.

GARDEN EXPERIMENTS.

I AM especially interested in the RURAL experiments as I have experimented considerably myself. Of a great variety of beans I have decided that the white-seeded German wax and the

Marrow are the best dwarf beans, and Caseknife, and what is here called the Pole Cranberry Bean the best Pole beans. I shall raise no more Early Feejee, Valentine, Black Indian Chief or Giant Wax, because the beans that are left after picking the shells, are not fit for baking dry in my opinion. I have an early kind of Pea Bean that does the best, grown in among the corn. The Yellow Chit sells for two cents higher per quart than any other kind, but it does not yield as well as the Pea Bean in the corn. I can make more money from an old garden and under Apple and Pear trees if beans are planted there, using ashes in the hill. The white and scarlet running beans make a nice show planted together, the white and red blossoms side by side. They yield well too and I consider the white better for use than the Horticultural.

The Golden Trophy tomato here grows large, irregular shaped with the stem sunken deep, few on the vine and a little late. The Green Gage is a small, smooth, yellow tomato, but neither of these or the Conqueror does so well as the Canada Victor with me.

The Early Rose potatoes are running out and I have tried sixteen kinds of new ones to get an early kind to take its place, but I have not got it. Bresee's Prolific, Snowflake, Genesee Co. King yield the best.

Grapes are very abundant this fall worth two cents a pound. The Concord does not ripen every year. I like the Adirondac and Hartford the best.

The Turban is the best fall squash and the Marblehead the best winter one. Splendid weather now, no frost; everything ripening well. G. W. CRANE.

Candia, N. J.

MUSK MELLON.

Two years ago we procured seed of all the novelties which were at that time obtainable, and tested them in the Rural grounds. With the exception of the "Green Climbing" Melon, so few ripened, and these so inferior in taste to old sorts, that we did not attempt any experiments last season.

The Green Climbing is a small, sweet melon, in no way superior to the Nutmeg.

English horticultural journals are at present praising the melon of which the accompanying is a portrait from a photograph.

It is described as being one of the deepest fleshed melons, the seeds occupying the "smallest possible space." The flesh is green, moderately firm, yet very juicy, ripening back to the rind "leaving it no thicker than a sixpence." The flavor is said to be unequaled, the plant vigorous, "the original one the past year having ripened four crops, in all twenty fruits."

We have only to call the attention of our seedsmen to the above novelty as being at least, worth a trial in this climate.

Arboricultural.

UPING RHODODENDRONS.

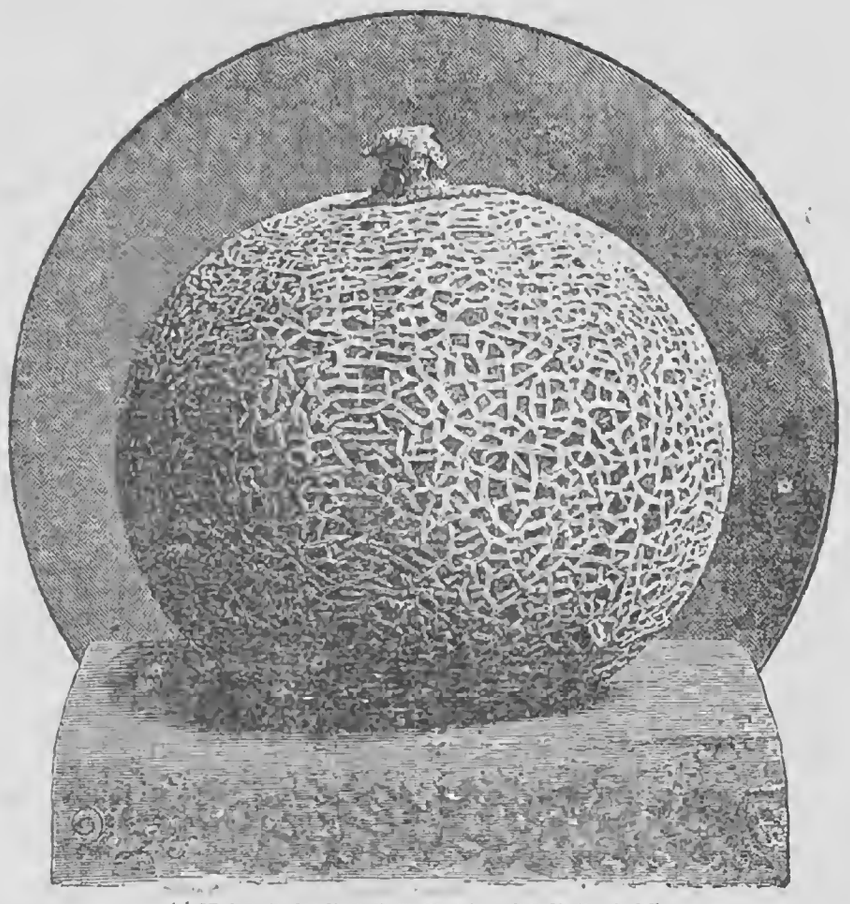
SAMUEL PARSONS.

WE propose to say a word on this apparently simple subject, not because we question the skill of many who execute such work, but for the purpose of correcting some prevailing errors that are apt to mar the result. It is a common remark of people proposing to plant, that they do not wish to crowd their limited space. The answer that a thinning out of overgrown trees and shrubs, after a period of ten or fifteen years, will remove all difficulty and permit enjoyment, during the meantime, of many more plants, does not satisfy. Large trees are wanted at once, and in such limited quantities as will remain at convenient distances for a life-time. We do not say that people are conscious of just such desires, but that their remarks give this impression. As a result of this feeling, trees are planted, hap-hazard all over the grass, without regard to definite plan or tasteful arrangement, and, above all, without attaining those long vistas and sweeps of pleasant turf which no lawn can afford to lose. In a few years, this hetreogeneous mass of foliage requires the sharp use of the ax, and only the greatest judgment and skill can develop graceful groupings out of the existing chaos. Of course, the chief lesson to be drawn from all this is, that the planter must have a well considered plan before commencing his work.

As the subject of general grouping, however, is quite a wide one, we will content ourselves, at present, with making some practical suggestions as to the formation of a very striking and effective group on the lawn, that of Rhododendrons, and indicating thereby something of the manner in which general grouping of trees should be studied. We have all experienced much pleasure, now and then, on observing a charming bit of landscape in an opening or edge of woodland. No analysis of this effect is usually made. We feel a thrill of delight and pass on; but if we will examine more closely, it will appear that the grouping of color and form is arranged on a definite plan of its own, but varied and shaded in a very irregular and exquisite style.

Now Nature does this work so well that we cannot do better than follow her lessons. Our Rhododendron groups in the woods wander down the banks of streams in masses both picturesque and attractive, but devoid of all formality. In a similar manner, the artificial group should be constituted. The outline of the bed should be varied and graceful, and not oval and circular except where absolutely necessary. All tendency to formality and sameness should thus be entirely avoided, and either a bank of foliage and flowers sloped upwards from the eye near a wall or solid background, or a still more irregular mass formed by placing, here and there, a larger specimen in the middle, graduating either way with smaller plants.

A good eye for color and knowledge of the appearance of different kinds will enable any one to contrive an arrangement of various hues that will enhance the beauty of each variety, and improve the general effect. Neither should the plants be huddled together to obtain at once the fullest effect of mass, but placed three or four feet apart according to size, so that, for several years at least, breathing space may be allowed without at the same time losing the compact appearance proper to a group. We have here only made certain suggestions relative to the grouping of Rhododendrons, but there are principles underlying even so limited a subject, that will bear much wider application. Indeed, too little attention is everywhere given to grouping trees on really sound principles of art.



"EXQUISITE" MELON.

Field Crops.

FOOD RESULTS OF THE CORN CROP OF THE UNITED STATES.

POSSIBILITIES OF BEEF, BREAD, AND OTHER STAPLES FROM THE CROP OF A SINGLE YEAR.

CONRAD WILSON.

IN a former estimate, published in another paper, giving the amount *per acre* of the food staples resulting from corn, I have already shown that the grain of this cereal, as compared with the stalks, is very nearly in the proportion of two to three by weight, and as two to one, in the value per acre; or, in other words, that a bushel of corn weighing sixty pounds, represents a product of stover equal to ninety pounds, and that when the grain is worth eighty cents per bushel, the stover producing it should be worth forty cents. From this it appears that an acre of corn amounting to seventy bushels, would give the following results:

Weight of grain,	4,200 lbs	Value of grain,	$56.00
" " stalks,	6,300 "	" " stalks,	28.00
Total weight....	10,500 "	Total value....	$84.00

Now, if we apply these estimates to the *entire corn crop of the country*, (which, according to the average of the last three years, is equal to abont 1,300,000,000 bushels), it will present the following figures:

Weight of grain	78,000,000,000 lbs
" " stalks	117,000,000,000 "
Total weight	195,000,000,009 "
Value of grain	$1,040,000,000
" " stalks	520,000,000
Total value	1,560,000,000

If we now estimate the entire value of the crop in terms of the grain; in other words, if we take, as in the former estimate, seventy bushels of the grain as equivalent to 100 bushels, when the stalk value is added, we then have 1,859,000,000 bushels, as the measure of value for the total crop, according to the standard of fifty-six pounds to the bushel, at over 1,700,000,000 bushels, on the basis of 60 pounds to the bushel.

Let us now see what amount of each of the leading food staples of this country the yearly corn crop is capable of producing separately, according to the above calculation.

The feeding value of corn, for the purpose of this investigation, may be proximately estimated by taking

1 Bushel of corn as equivalent to	8½ lbs	of Beef
" " "	15 "	Mutton
" " "	15 "	Pork
" " "	6 "	Butter
" " "	120 "	Milk
" " "	120 "	Corn Bread

Without claiming that these figures are rigorously exact, they are still not far from the average experience of farmers. In fact, they are every year surpassed, and some of them greatly surpassed, by the achievements of successful men. But taking the figures as here given, it will be found that the corn crop of the United States, when measured separately by these staples, is capable of producing either of the following food results:

Beef	14,450,000,000 lbs
Mutton	25,500,000,000 "
Pork	25,500,000,000 "
Butter	10,200,000,000 "
Milk	204,000,000,000 "
Corn Bread	204,000,000,000 "

Assuming the population of the United States to be 45,000,000, the above products, if distributed equally among the people, would give to every man, woman, and child in the country either of the following amounts of food: 321 pounds of beef, 566 pounds of mutton, 566 pounds of pork, 4,532 pounds of milk, or 4,532 pounds of corn bread.

Having thus estimated the total corn product separately for each of these staples, let us now suppose the crop to be so divided as to apply one-half of it to the production of beef, and one-eighth each to the production of mutton, pork, milk, and bread. The result would then be a greater variety of food, while the relative proportion of each kind would supply a larger amount of nutriment than either kind separately.

The entire crop, when thus distributed, would be sufficient to furnish annually to each inhabitant the following variety and amount of food: 160 pounds of beef, 70½ pounds of pork, 70½ pounds of mutton, 566 pounds of milk, and 566 pounds of corn bread. Total weight, 1,433 pounds.

Finally, if this food were divided into daily rations, it would be found sufficient to furnish to each inhabitant of the whole country 11 ounces of corn bread; 11 oz. of milk, and 6 oz. of meat, making a total of 28 oz. daily for 800 days.

But the proportion of nutriment contained in this ration is quite beyond the ordinary requirements of an average population. Even in the case of able bodied men, a less proportion of muscle-forming food has been found sufficient to maintain their strength and weight unimpaired. Prof. JOHNSTON has cited the experience of some institutions in Scotland, from which it appears that more than two-thirds of the inmates either maintained or increased their weight on a daily ration of seventeen ounces each, while in the present case, the ration indicated amounts to twenty-eight ounces each for the entire population, including children and infants.

If then, this ration were reduced to the standard quoted by Prof. JOHNSTON, it is perfectly clear that the total food product resulting from our corn crop would feed the people of the whole country, not for 800 days only, but for more than 1,200 days. Is there any other country on the globe in which such an amount of food and of such variety, can be produced in a single year and from a single crop? If there is, the fact is well worth knowing, for the subject is one of more than usual interest, and prospectively important to the human race.

Entomological.

THE COLORADO POTATO BEETLE.

PROF. CYRUS THOMAS.

CARBONDALE, Ill., Dec. 26, 1877.

I HAVE just received from Dr. HAYDEN, the U. S. Geologist, colored figures of the Colorado or Ten-lined Potato Beetle in its various stages, and of its work as it appears to our Dutch friends across the water. It came over in a letter from G. JANSE, conservator of the Royal Society of Zeology, Amsterdam. These figures, although perhaps slightly erroneous in some minor details are nevertheless very good, and sufficient to enable anyone to determine the species. I mention this fact as showing the way they go to work in Europe to prevent the progress of a dangerous insect enemy; to wit, by making it thoroughly known to the people.

And now that I am on the subject of this notorious species, I wish to call attention to a part of its history which appears to have been overlooked by recent authors, even those who claim to give it fully.

On the 7th of July, 1861, Mr. "J. E." (afterwards ascertained to be J. EDGERTON) wrote to the Prairie Farmer, as follows: "Crops of all kinds bid fair to be very heavy, except potatoes in some places are much injured by a striped bug, very much the shape of a grain of coffee, but about twice as large. They made their appearance as soon as the potatoes were up, and soon had a host of grubs, or larvæ to help them, totally ruining many and damaging others. It is something I never saw before."

This was published in the Prairie Farmer of July 18, 1861, and I believe is noticed by one of the numerous writers on this insect; Prof. RILEY omits it in his history of the species. On the 2nd of August 1861, Mr. EDGERTON sent another letter to the editors of the Prairie Farmer, accompanied by specimens of the insects alluded to in the former communication. These with the letter, were forwarded to me for determination, and were received Saturday, August 24th. On Monday following, I returned an answer which, with Mr. EDGERTON's letter, was published in one article of the Prairie Farmer, Aug. 29, 1861. From this I quote the following:

"EDS. Prairie Farmer:—Your box containing some specimens of a species of beetle, with accompanying letter, came to hand last Saturday, and to-day (Monday) I return you an answer. The specimens enclosed by Mr. EDGERTON, belong to Doryphora 10-lineata (Say) and is the Polygramma 10-lineata, Chevrolat, and Melsheimer Catalogue, and P. juncta (Germar)." After this follows a description and other remarks.

Here then is the determination of the species fully a year in advance of any thing by Messrs. WALSH or RILEY, and the connecting link upon which Mr. WALSH afterwards, in part, based the correct theory of their march eastward; yet neither Mr. WALSH nor Prof. RILEY takes any notice whatever of this, really the starting point of the history of the species as a potato-eating insect. The letter of Mr. EDGERTON which is published in the same paper is repeatedly alluded to, but by some strange oversight this part of its history is left blank.

Perhaps it is due to the fact, that although correctly determining the species, I—following our highest authority on Coleoptera—included *juncta* as belonging to the same species. But this furnished no reason for omitting this part of its history, especially when we remember that Dr. FITCH, Mr. WALSH and Prof. RILEY all did the same thing until 1865, when Mr. WALSH called attention to the distinction between the two; Prof. RILEY even bred the Potato Beetle and traced it through its stages as did also Mr WALSH without then even suspecting the error

of confounding the species. RODGERS had in 1856 called attention to the distinctions between the two, but this had been forgotten or overlooked, until Mr. WALSH called attention to it as a means of explaining differences in habits of what was, until then, supposed to be races of the same species.

I presume it is of very little importance to the general public who first identified this species, yet we may as well fill up the blanks in the history of so important a personage as the "Colorado"—or as it in reality was first named by me in January, 1862*—"Ten-lined Potato Beetle;" especially as it is now receiving so much attention in Europe.

*See Transactions of Illinois State Agricultural Society, Vol. 5, pages 437 and 150. The first page gives the name—on the second will be found the date when the essay was received and read—January 1862.

Floricultural.

BULBS FOR THE FLOWER GARDEN.

W. C. L. DREW.

CROWN IMPERIALS.

THE Crown Imperial or Fritillaria Imperialis is an old-fashioned, stately plant, which should be in every garden. It is a native of Persia, whence it was introduced into English and French gardens over two hundred years ago. Since then, it has remained a general favorite among spring flowers. Being pre-eminently a florist's flower, it is remarkable that it has continued without change. We have to-day the self-same varieties — red, yellow, variegated foliage and double flowered — that grew in Persia two hundred years ago uncultivated and almost unknown.

The construction of the Crown Imperial is in itself a point which should recommend it for cultivation if only for careful examination. It is noted for the drooping habit of the brilliant tulip-shaped corollas which have the appearance of so many highly-colored cups or bells. The interior of the flower is unlike that of any other known species. At the base of the drooping cup, on the inside, there are always found six drops of water resembling pearls. What functions these drops of water perform has never been clearly set forth by any botanist, nor has it been told how they have been formed. They cannot be shaken out of the cups even by the fiercest gale, and if one is removed by some instrument, another will soon form. Another grace which the flower possesses is its golden stigma which an enraptured poet lauds as—

"The dazzling gem
That beams in fritillaria's diadem."

With the first days of spring, before the frost has hardly released the ground from its icy grasp, the stem of the Crown Imperial begins to show its brilliant green. It rapidly ascends until it stands a column three feet high, of the brightest shining green. Near the top of this column is produced the crown of large pendant bell-shaped flowers, from five to twelve in number. These are re-crowned at the very summit with a tuft of glossy, green leaves, rendering the Crown Imperial one of the most conspicuous and ornamental gems of the flower garden. The flowers are produced in April and May, and while in bloom are the chief attraction of all the garden, yet for fragrance they are really not at all desirable; being, in fact, almost repulsive when in the sunshine.

Crown Imperials grow readily in any good garden loam. Plant the bulbs during October or November, about five inches deep and one foot apart. They should remain undisturbed for, at least, three years, when their bloom will be magnificent. For effective display they should occupy a position in mixed borders, in center of bulb beds or in shrubberies. Aurora, orange; Crown upon Crown, red; Rubra simplis, single, red; Rubra plena, double red; Lutea plena, double yellow; Maxima lutea, single yellow; Folia aurea var., with gold-striped foliage; Folia argentea var., with silver foliage and Orange Crown are the varieties in general cultivation.

DIPLADENIAS.

THESE are handsome flowering plants, all climbers, belonging to the Apocynaceæ. They are excellent for the decoration of the stove. If for exhibition, they should be trained upon wire balloon-shaped trellises, but the young growths should be allowed to grow upon strings up to the rafters of the house, and a short time before the blooms open they should be taken down and fixed upon the trellis. They should be treated as follows: put them in a mixture of peat and turfy loam in equal proportions, with the addition of a good portion of silver sand; good drainage is also of particular importance with these plants. They require a moist atmosphere, and a bottom heat, ranging from 80° to 90°, together with full exposure to the sun's light. But although I recommend bottom heat for these plants, I, by no means, consider it desirable that they should be plunged into it; rather let them stand over this heat, and keep the atmosphere moist by sprinkling the stages and paths with water.

Towards the end of summer, after they have done flowering and have finished their growth remove them to a cooler house and fully expose them to sunlight, to ripen the wood. The temperature they enjoy is in summer from

DIPLADENIA WILLIAMSII

65° to 85° with a moderate quantity of water, which must be applied with great care. In winter very little water will be required, and the temperature should be reduced to 60°—65°; from this, if they are wanted for exhibition in May or June, they must be brought, and placed in heat again about the beginning of January. D. Williamsii, the subject of the present cut, is a fine garden variety and quite distinct. It is remarkably free, both in habit of growth and flower. The leaves are stout, oblong, tapering to a sharp point, and upward of six inches long, by about an inch in breadth at the widest part. The flowers are produced in large clusters in the greatest abundance — indeed, a marked feature of this variety is the great length to which the spike reaches, and consequently the greater quantity of blooms. The flowers are large and of good subtance, measuring upwards of four inches across the limb; the lobes are round and full; the color is a soft delicate pink, while that of the throat is a deep rose.

B. S. WILLIAMS,

Victoria and Paradise Nurseries, Upper Holloway, London, England.

Miscellaneous.

WESTERN ECHOES FROM "THE MAPLE SHADOWS."

DR. A. C. WILLIAMS.

As I have before indicated, the farmers in central Illinois are so engrossed in raising corn and feeding it out to hogs, that all other branches of tillage and husbandry have received little or no attention at all, and the farmer who is not straining every nerve, even to over-cropping, to produce corn, and striving to blemish every pig money will buy, with his own individual earmark, is regarded as not doing well, and one who will not be able to cancel the mortgage placed, years ago, on his farm—for we are all mortgaged. There is so much room for improvement in all the avenues of agriculture other than that of producing and feeding corn, that my heart bleeds for the man who dares to make his money in any other manner than the one so prevalent, since I know he will be regarded either as crazy or a fool. Fruit-raising, market-gardening, and horticulture in general, are so little thought of, despite the distrust with which the initial steps will be observed, that there is certainly a good opening in this line here, however unfavorably pioneer operators will be regarded by those wedded to the production of corn, only. The little extra care and interest given to orcharding and gardening by a few, now elicits so much derision, and we are so heartily characterized as trifling and foolishly wasteful of time, as to warrant the opinion and prediction I have expressed.

The week prior to Christmas was one of the most remarkable "spells of weather" ever witnessed in Illinois. The mercury stood at 80° Farh., and all sorts of seeds in the garden and flower beds germinated and sprung up thickly as if it were May, and strawberry plants sent up numerous young tender leaves.

How to give my twenty-five varieties of strawberries ample innocuous winter protection, was a problem with which I began to interest myself early last fall, and it was not until I stood with a forkful of prairie hay, that I came to a conclusion. Some of the sorts were tender, others were expensive, and yet there were others valued because they were given me, and I wished to save all. In all of the half-dozen papers I was taking, were anxious inquiries from those evidently in the same dilemma. Of course, they were told how to use evergreen boughs. I am ashamed to admit that as yet I have no evergreens. I went to the forest and cut off the tip ends of limbs from such oaks as hold their foliage till cast off in the spring by the swelling of the buds. Those limbs were selected which had two or more smaller branches, and I placed them over the plants in such a manner that they held up the hay, and thus prevented smothering. Well! "Eureka," and that is all about that.

So sure as I live, I am going to put out a good evergreen screen around my entire grounds next spring. Eliminate every other consideration—ornamentation, protection, all—and it will pay in the item of boughs alone, used for protecting strawberries, and all such plants as are, or should be, in every lawn and garden, which are the better by judicious protection.

I am experimenting with a dozen peach trees, with a view to fruit next year. I have laid down six, and covered them with litter; the branches of others I have bent down and covered with earth, while others again have several branches either wrapped with straw or old garments. I headed back two or three, this fall, instead of waiting till spring, and shall treat them so several years, and watch the result. When covering strawberries, I found those short, brushy branchs I had taken off, very handy for supporting the straw over the plants.

SEED EXCHANGE.

WHILE traveling among the mountains of northern California, last summer, I gathered the seeds of several interesting and useful plants. Among them are Calycanthus occidentalis, Cereis occidentalis (a beautiful shrub), Ceanothus integrinus (California lilac), Manzanita (red bark), nuts of Pinus Lombertiana (sugar pine), Schinus molle (pepper tree), Escholtzia (California peppy). I also have seeds to spare of Double Pink Hollyhock, Verbenas mixed, all colors. Also, Acrolinium and Xeranthemum, seeds saved from finest specimen plants. Will exchange any of these for Lillium Chalcedonicum, L. auratum, L. longiflorum, L. lancif. album, or other Lily bulbs.

LUTHER BURBANK.

Santa Rosa, Cal., Dec. 12, 1877.

The Poultry Yard.

DOES POULTRY PAY? No. IV.

HENRY HALES.

As eggs sell better in winter than at any other time, it is well to keep such fowls as lay best in winter, and to keep them in laying condition, Hens will not lay unless kept in good order—not too fat but active; combs, bright red; eye, sparkling; feathers, close and glossy; and their whole appearance lively and healthy.

The Leghorns are fowls that answer best for marketable eggs; they respond quickly to extra food and care, and will lay in cold weather, if they have a warm house. The Brown appear to be a little hardier than the White, especially when young, and they are also the best layers. If a cross is preferred, the Light Brahma appears to me to be the best cross. The cross, hardens their constitutions so that they care less about cold. It will not, however, improve their summer laying, but will make many of them want to sit, which the pure-bred Leghorn does not often do, yet I once had four out of seven young hens sit, and after sitting steadily, they made good mothers. But the complaint generally is that they don't sit steadily, often leaving the nest after sitting half their time. The Browns sit better than the Whites.

As I have said, the secret of winter laying lies in getting hens up in a good condition. A practical florist, when he goes into a green-house, can tell at a glance the exact condition of the plants he sees around him, and what they require if out of order; so can the keeper of poultry judge his stock, if he is fit for his business. Fresh air is important. On every warm enough day give the houses all the air you can; have the openings for ventilation close up to the ceiling. Open them when the weather allows, and have them a little way open in all but the extremest cold weather, even at night; but when the wind blows cold, so as to cause a draft through the house, close the windward ventilators.

Cleanliness is the most important consideration in keeping many fowls. The dirt multiplies faster than the comparative number of birds. To take up the droppings every morning (especially if the stock is confined in the house through bad weather) involves some labor; but if this is done systematically, the trouble is much lightened. A broad shovel, and a short hoe or scraper, set in motion with ordinary muscle and locomotion, soon does the job. Keep a barrel just outside the door, a box can be used to carry out the manure to the barrel, when the door cannot be left open; keep the barrel covered and dry, and when filled remove its contents to the manure pile. One thing that requires special attention, when the fowls are weather-bound, is the feeding and watering without getting soil into their food and water. Have their utensils so protected that the stock cannot either step into or roost on them. Besides the food and care recommended in the RURAL, broken oyster shells, should be supplied to every house; the hens crave them; they are also fond of crushed bone, the lime of which enters largely into the composition of egg shell.

Industrial Implements.

A NEW CORN SHELLER.

MESSRS. LIVINGSTON & Co., Pittsburgh, Pa., sent us for trial one of their small Hand Corn Shellers. After six weeks' use on our Experimental Farm, it is reported that the Sheller works very nicely, shelling perfectly, leaving no kernels on the cob, and hence no waste. A clamp is used to fasten the apparatus to any convenient support, and the simplicity and durability of the mechanism make it proof against the rough usage of careless or inexperienced operators. Cheapness in price is not the least of its merits.

W. A. KELSEY & Co. are making a large number of their Excelsior presses for Holiday presents. We are glad to hear of such an appreciative demand. A good printing press always leads to something educating and profitable.

Domestic Economy.

CONDUCTED BY EMILY MAPLE

SHALL WE BEND TO OUR WORK, OR BEND OUR WORK TO OURSELVES.?

In the early days of our mothers and grandmothers, it was generally considered by good dames and housewives a most unpardonable lack of thrift for a lady to commence a new piece of work—of sewing for instance—while an unfinished piece lay before her. And, indeed, so decided was my early training in this respect, that I have felt it sometimes to be almost a disgrace when, for lack of strength, I have sometimes been compelled to lay aside for the time being incompleted work for something lighter and more in accordance with my tastes and feelings, at that particular time. Indeed I have practiced humoring my peculiar moods—provided they were not unreasonable—somewhat of late years, and am fully satisfied that it is economy to do so: economy, not only of time and strength, but of good nature, and of general wear and tear of the system. I find that I am not alone in this digression from the ways of our good mothers.

An esteemed neighbor said to me some two years since: "I have done nothing but mend for three days," excepting, of course, her daily household duties. "I used to think," she continued "that my mending must always be done at a certain time, but when Mother was here last Winter, after noticing one day that my mending and I were not at all agreed, and that I could make no satisfactory progress, she said: "Lay it away now, Minnie, and perhaps to-morrow you will enjoy doing such work." "She then gave me a rule," said my friend "which I have adopted, and find that I can accomplish much more, by observing. It is this: "Never, unless it is necessary, punish yourself by doing a certain piece of work when you cannot enter into the spirit of it." I will remark right here, that I hardly think that this rule is applicable, except to energetic, driving people, invalids, and to tired overworked Mothers. There are times when I can heartily endorse this rule. Why, sometimes I could mend, every day for a week, if it was necessary, but I could not do it with pleasure, if I were always obliged to attend to it as fast as the rents were ready for the needle, and I was rejoiced to know that such a good and exemplary woman, in all respects, as was the Mother of my friend, should advocate such ideas, for few women—if any—have accomplished more in a busy, useful life, than she.

And I have additional evidence from another most useful, energetic woman. She is a great Christian worker, a minister's wife, and does her own work for a family of four. Yet, with all this, she finds time to do fancy-work, and of different kinds, from the charming patchwork quilts and embroidered table-covers and Afghans, to some of the most beautiful oil paintings that ever graced a parlor in the West. She loses no time, however, always having some light work ready to do whenever she has visitors or is visiting.

When she showed us some six kinds of work which she had begun and had determined to finish before Christmas, I said:—"You do not follow the teachings of our mothers, to always finish one piece before you begin another?" "No, indeed," she answered, "I never should accomplish much if I did."

After all, I think that our mothers were right in forming such habits of "stick-to-it-iveness" in early life; for after we reach mature years, if a "new departure" seems necessary, it is then soon enough to begin. Hope Evermore.

DOMESTIC RECIPES.

Tapioca Jelly.

Soak three tablespoonfuls of Tapioca over night in a pint of water; place over the fire and let it cook slowly until it is clear; add a cup of sugar, and after it is removed from the fire flavor with lemon to the taste.

Tapioca Pudding.

Prepare the same as for jelly and add one pint of cream and four eggs; stir well and bake until done. Perhaps while eating Tapioca we should some of us like to know what it is, and where it comes from. It is the starch obtained from the root of the Manihot or Jatropha manihot, a native of Brazil. It is separated from the other substances of the root and dried on hot plates which are continually agitated, in this way forming the granulars which we see. The juice of the plant is very poisonous.

Apple Pickles.

Pare and halve the apple, removing the cores carefully, to keep them in good shape; steam them; heat spiced vinegar and pour over them. The vinegar from pickled peaches is very nice, when one has it.

Cream Pie.

Make a crust with cream; line a pie dish; butter the crust; then fill with thick, sweet cream; add one cup of sugar and flour to thicken it a little when done; flavor and bake in a quick oven. Loretta E. Turner.

Cheap Fruit Cake.

Seventeen ounces of brown sugar; five eggs; one pound of raisins: one pound of currants; one-fourth pound of citron; one heaping teaspoonful of soda; one-half cupful of molasses; one tumblerful of sweetened vinegar—I use that from pickled peaches or pears; one tablespoonful cloves; one tablespoonful of cinnamon; one nutmeg; one pound of flour. This will keep one year.

Crullers.

Three eggs; one cup of sugar: butter the size of an egg; a little salt; a very little soda; knead stiff, roll, cut into any fancy shape and fry in hot lard. These are very nice.

Will some one please tell me how to make a good paste for a scrap-book? Mrs. Bart.

Irish Cabbage.

Chop fine a medium sized head of cabbage and season with butter, pepper and salt; add water enough to cook until very tender; then when almost dry add a cup of thick sweet cream and simmer a few minutes longer. This way of cooking cabbage is a little different from anything I have read in the Rural and is one of the many excellent dishes prepared by a professional cook. For those who prefer cabbage with vinegar, a good way is to use half cream and half vinegar, or for those who do not have cream, use milk and thicken with a little flour.

To Color Brown with Cutch.

For five pounds of cotton rags or yarn allow one and one-half pounds of cutch; two ounces of blue vitriol; two ounces of bichromate of potash. Use sufficient soft water to cover the goods; boil until the cutch is dissolved then add the vitriol; stir well: put in the cloth and let it remain over night; rinse in the morning, and put into as much boiling water, in which the bichromate of potash has been dissolved as will cover the cloth; let it remain fifteen minutes and then rinse in cold water. My experience with the recipe is that it will color just as well without remaining so long in the dye and that washing in strong soap-suds turns it a good shade darker and by thus rinsing, half in suds and half in clear water, a shaded stripe can be made. By coloring some rags nankeen buff in a dye made of strong lye and copperas a very handsome stripe can be made of the dark brown, light brown and buff. A. P., Northville.

Everywhere.

PERSONAL OBSERVATIONS OF A "COMMERCIAL TRAVELER."

Having just returned from a business tour through Mississippi, it occurs to me the patrons of your valuable journal would be glad to learn something touching the local and agricultural interests of that State.

Twenty-four years ago, I made an extended tour through Alabama and Mississippi, and from that time for the following eight years, I was a constant traveler through the south, hence my familiarity with the old system of agriculture, and with the practices adopted by planters in those days. Time has wrought many wondrous changes in the South. The rich planter of former years no longer folds his arms and sits at ease upon the soft couch of his stately mansion. The overseer and numerous slaves are no longer to be seen gathered together in the broad field of their master, singing their happy songs as they toil in the cotton patch, or "hoe de corn." To-day we find the planter, driven by force of circumstances, adopting other means by which to sustain himself and family.

Those familiar with the cultivation of cotton, well know how essential it is to have skilled labor at their command, labor which they can control at all seasons of the year, especially in early summer, when grasses grow rapidly and crops are endangered for want of prompt and efficient labor. This has been, and is still, one of the annoyances of a planter's life, to overcome which many are cutting up their lands in patches of twenty-five, fifty, or perhaps one hundred acres, and renting them to the negro who cultivates them on shares. By this means a mutual interest arises in the production of a crop. There are many instances where the negro rents the land at a fixed price. In either case the result may be viewed with favor, as in no other way can the property owner control the labor, or cultivate his lands with any assurance of success. We find, under the present system, the negro is rising to the surface, where he had been under the influence and training of a thorough master in his days of slavery, and thus gained some idea of system and economy; such negroes are becoming, to a considerable extent, the bone and sinew of the country.

While at Crystal Springs, some three weeks since, I was introduced to a colored man who came to town for the purpose of selling his cotton, and in conversation, learned he had made twelve bales of cotton this year, that he was the owner of 260 acres of land, of mules, oxen, wagons and other farming appurtenances, all of which were paid for, and he out of debt, with his twelve bales of cotton ahead. This is one instance of the success of the negro, coming under my own observation.

As I passed from town to town, and hamlet to hamlet, I noticed with peculiar interest and pleasure, the thriving condition of the entire country. The quiet inland town of former days that knew no excitement beyond the usual arrival or departure of a four-horse stage coach, or a visit by some traveling circus, has given place to many thriving towns and villages dotted along the lines of railroads which now skirt the State of Mississippi, from north to south and from east to west. And while many of my commercial traveling companions on the road complain of the hardships they have to suffer, the terrible oppression of railroads taxing them five cents per mile, and extra for all baggage over 100 pounds, I for one consider it a pleasure, and doubt not, if they had been schooled under the old system of paying ten cents per mile, and the privilege of "toting" a rail, they too, would join me in a hearty approval of present facilities.

The railroads of Mississippi have been, and are still a blessing to the State; but while we appreciate them in fact, we cannot but censure them for many local grievances under which merchants and planters feel oppressed.

We are informed the Mobile and Ohio and Mississippi Central railroads will carry cotton from Memphis, Tenn., to New Orleans or Mobile for one dollar per bale, owing to the fact that boats on the river come in competition with them from that point; while from the middle portion of the State, some two hundred miles nearer the seabord, they tax the merchant or planter three to three and a half dollars per bale. This we regard as oppressive, and the planter as well as the merchant should look to his interest in this matter.

Passing up the Mobile and Ohio road from West Point to Okolona, we pass over what may be strictly termed the garden spot of the United States. Here we view the beautiful prairie stretching out on every side as far as the eye can see, and the stranger, as he looks out over the broad fields of cotton (some of which still remain unpicked) cannot help exclaiming, "this is truly a paradise for the farmer!" The soil is fertile, being of a rich black color and adapted, not only to the culture of cotton and corn, but to every plant, shrub, and seed that grows and is adapted to the climate.

In conclusion I will say, if there are farmers at the north, not satisfied with their success as agriculturists, let them emigrate to Mississippi, where lands are cheap, and a sure remuneration for their labors awaits them. [Yet farmers of Mississippi are thronging by railroad, boat and wagon to Texas.—Eds.] D. Snedeker.

FROM MAINE.

The past season has been marked by an unusual and long-continued drought, which began in May and ended in October. Light showers and occasional rains broke its full severity, but did not avert its disastrous effects. As a consequence, the crops have been much reduced and the returns less remunerative than otherwise would have been. The middle of April found the ground bare and the birds returning. This unusually early opening was followed by fine weather, and considerable seed was put in during the month. May followed equally favorable. Planting was a fortnight ahead of the average, and time was thus afforded for putting in greater breadths or for making needed permanent farm improvements. Farmers being ahead of their regular work, the whole season has given them the time to dig rocks, clear up rough places, draining low lands, swamps and meadows, repairing or building fences or buildings, and making improvements generally. More permanent improvements have been inaugurated and carried forward in Maine the last season than for five years—perhaps ten—before.

The crops were light—hay, corn and beans being the best. The hay crop was less than an average. Corn an average, also beans. Potatoes fell off fifty per cent. Wheat nearly the same, other grains more. Apples a failure. Small fruits about an average, except the later ones. Pasturage poor. Stock came to barn in poor condition in many cases.

The three leading things that pay in Maine, and about the only ones that will do to figure Dr. and Cr. upon, are hens, sheep, and cows, in the order named. Pigs in connection with the dairy, will pay a handsome return. Bees cost nothing for pasture or keeping, except care and shelter: they often pay well with us, but our severe climate in winters oftentimes causes severe loss.

The Dairy interest here is important, but at present not well organized, and hence not well conducted. A few years ago Maine rushed into associated dairying with Yankee impetuosity and with sanguine hopes that could not be realized practically. A few years' trial with lowering prices and a falling market—in general with shrinkage of all other prices—disheartened many cheese factory companies, and the factories have been closed or sold out for other purposes. The factories were run by associated effort. At first they were dependent upon Massachusetts, New York or Vermont for their cheese-makers. They had to pay them high wages. Expenses were high, and just as they were getting prepared to run them economically—hence, successfully—the reaction came, and the popular mind turned against them in many places.

No State has better grazing land than Maine. It is peculiarly fitted for a dairy country. It will eventually become a leading dairy State. It must henceforward depend upon the sheep-fold and dairy for agricultural prosperity. The limit of selling hay and potatoes has been almost reached. Wool, mutton, butter and cheese must be its exports. With these two leading branches may be run as auxiliaries the hennery, the orchard and the swinery.

The Maine Dairymen's Association will meet this winter at South Paris, in Oxford Co. It is expected legislative aid will be granted to enable the holding of fairs by this society, and to enable it to better organize our dairy interests.

The winter has been remarkable so far. No sleighing (Dec. 24) and the month has been mild as April last year at this time, and usually, we have a foot or more of snow and zero weather.

Maine is a great lumbering State. Men and teams are going into the woods for their winter's operations in the northern part of the State, and large quantities of logs will be cut. The Kennebec, Penobscot, Androscoggin, Union, Machias, St. Croix, and Aroostook Rivers furnish driveways for the logs, down which they are floated to the places of manufacture upon their banks.

But were I to attempt to give an outline of our varied industries, I should far exceed my allotted space, so I will reserve this interesting recital to future letters. In closing, let me wish you the best of success, and that permanency and endurance warranted by their merits of every department of the noble Rural.

Brooks, Me. J. W. Lang.

RURAL SPECIAL REPORTS.

Waukesha Co., Wis., Dec. 17, 1877.

I am often aided in my business by reading the letters you so kindly print in your very excellent paper—not only aided, but interested. We learn the customs of our fellow-farmers in the different localities they write from: the prosperity they enjoy, etc. It makes us feel a desire to communicate with the paper, too, and give a little of our own experience.

Our home is in Wisconsin, thirty miles west from Milwaukee, on the line of the Chicago, Milwaukee and Saint Paul railroad. Our county is principally oak openings; the soil is a clay loam—excellent wheat land;—there are some small prairies of about three to six miles square. There is an abundance of water for all purposes, both for stock and milling privileges. The county is interspersed with beautiful lakes from a mile to three miles in length, stocked with the finest of fish. Pickerel, bass, and numerous other kinds, excellent for the table, abound.

I spoke of our soil as being adapted for wheat-growing; I should have said spring wheat, as it is only an occasional winter that we are favored with sufficient snow to protect fall-sown grain. Last winter, however, was an exception to the general rule, and the crop of fall-sown wheat was good. We are trying some again this fall; it is looking finely. The same may be said of our rye of which we sow, more or less, every year, considering it a paying crop, especially as we usually seed after it, clover seed catching so much better when sowed on a covering of snow during the month of March.

Prices current in our town are:—Wheat, No. 1, $1.00; oats, 25c.; corn, 40c.; potatoes, 35@40c.; rye, 45c.; barley, 50c. Our market town is Oconomowoc, a thriving place of about 3,000 inhabitants, noted for its superb hotels and beautiful lakes which afford amusement and comfort to many visitors and pleasure-seekers, during the summer months. Being on the line of the Saint Paul railway, we find a ready market for all our stock and produce having a quick transit to our larger cities—Milwaukee and Chicago—and thence to your great metropolis. We would not be called boastful, but we think our butter, cheese, wheat, potatoes, pork, beef and poultry can't be beat. The butter made by some of our good farmers' wives will compare favorably with your Orange County article. Had

I the time, and you the space and patience, I would like to give my brother farmers my plan of housing and feeding stock, and keeping them thriving here in our severe and long winters. [For practical information of this kind there will always be room in the RURAL.—EDS.] We are having remarkable weather. The past two months it has rained, snowed, frozen and thawed alternately, keeping our roads very rough and, at times, nearly impassable for loads and teams. At one time we even ventured to use our sleighs; and now, to-day, my boys are in the field plowing with both teams, the ground working splendidly. I must forward this in haste, or I may have to chronicle a snow-storm. H. F. S.

CHAUTAUQUA Co. N. Y., Dec. 25th, 1877.

THINKING a few lines from this locality might not be amiss, I will pen a few for "Everywhere" in which I am much interested.

The weather here is warm and mild; we have had but two slight falls of snow which did not lie long, and but little frost. Farmers are engaged doing their spring plowing, and cutting wood. There is a strip of country through here running south from Lake Erie, that is usually blessed—or troubled—with very heavy snow-falls during the winter season. But from this place a person may travel in any direction during the winter, from ten to fifteen miles, and find far less snow. Perhaps this may be one reason why we have such a fine apple country here. Indeed, we challenge the world to produce fruit finer in color and flavor, than that grown on these same gravelly hills of old Chautauqua. Thousands of barrels were shipped from this place this fall, for which the farmers received from $1.75 to $2.00 per barrel. But when you come to the raising of grain, there you have us. This is not a good grain country, but a dairy and stock region. Butter-making is the chief means of keeping the farmer from the poor-house. We are slowly improving our cows by the introduction of blooded bulls. Butter now brings 26 cents for choice fall make. The farmer is fast doing away with the middlemen here, by generally shipping his produce himself. Corn is worth 50c.; oats, 25c. potatoes, 40c.; eggs, 20c. per dozen. Good milch cows, $25 to $30 apiece.

A YOUNG WORKING FARMER.

CARLTON, Wis., Dec. 24.

THE weather is the warmest this winter that was ever known here. Generally, by this time the ground is frozen hard and the sleighing good. Now, there is not a particle of frost in the ground. It has rained almost incessantly for two weeks. The roads are almost impassable. Hay is slow at $10 per ton; wheat, $1 per bushel; potatoes, 50 cents; butter, 25 cents per pound. The buds of the trees are swollen, and in places the grass has started. Diphtheria has raged here for the last two months, and in one school district in this town (No. 1) there have been fifteen deaths in less than one month's time. I clipped an article from the RURAL on diphtheria, written by Dr. GOODENOUGH, and had it published in the County papers. The advice he gave was needed here, and it has resulted in doing much good. At present, it is abating somewhat, and we hope the worst is past.

JOHN A. WHITAKER.

EL DORADO, Cal., Dec. 20.

ON the 18th we had a general shower throughout the State. At Los Angeles, 2.15 inches of rain fell in twelve hours, the heaviest rain ever known in that section; here, we had only a small shower. The 19th was clear and bright; to-day we have the appearances of a good storm, so I think California is safe for another year. I tell you, it makes happy faces and hearts. Feed is good; grain looks finely. Sowing continues. In the flower garden, Pansies, Verbenas, Alyssum, Violets, and their companions, are showing their brightest colors. A few days ago I saw a rose bush in full bloom in the country.

W. C. L. D.

A COLONY FOR NORTH CAROLINA.—It is proposed to form a colony to settle in the central part of North Carolina, to be composed of Northern men and women, farmers, mechanics—any and all who desire to better their condition. The climate is fine, soil fertile, land cheap; native people moral, kind, and hospitable. The water, timber, and climate unexcelled; mines of iron, coal, gold, &c., abound. All who desire to join this co-operative colony, may learn more of its prospects, &c., by addressing J. W. LANG, Brooks, Me., who will cheerfully furnish information.

BELMONT Co., Ohio.

THE wheather here is clear and warm. No frost at night. Dandelions in blossom. I have just finished harrowing a corn stubble. The ground is quite mellow. I expect to commence to plow to morrow. I. N. B.

QUEBEC, Canada, Dec. 24.

TO DAY we have no snow. A very heavy hoar-frost has made our orchard and garden a fairy land of the Frost King. A strange season for cold Canada. A. L. J.

Hygienic Information.

SCARLET FEVER.

DR GOODENOUGH.

SCARLET FEVER, otherwise known as Scarletina, is usually classed with small-pox, chicken-pox and measles, among the eruptive forms of fever; but it is distinguished from these by the fact that the eruption appears as a rash, whereas in the other diseases, it assumes the form of vesicles or postules. It is one of the most contagious of maladies, and the infectious material remains for a long time in clothing etc., preserving the power of producing the disease. Children are much more liable to it than adults, and it is rarely contracted under two years of age or over forty. As a rule the disease is experienced only once, but to this rule there are many exceptions. Between the reception of the infection and the manifestation of the disease, the interval is generally short, sometimes not more than twenty-four hours and rarely so long as a week.

Sometimes the disease commences with a chill, and vomiting is generally one of the earliest symptoms, especially in children. A high fever at once sets in, the pulse flutters rapidly, the body often feels burning to the touch, while the temperature under the arm frequently rises to 105° or even higher. In this, as in all other fevers, an extremely high temperature is a pretty sure indication of imminent danger to life, and if it remains for any length of time over 105° death is always to be apprehended. In about twenty-four hours after the commencement of the attack the eruption appears, first in the neck, next on the breast and stomach, and finally on the limbs, covering the entire body generally in a couple of days. The rash is of a scarlet color, and is sometimes diffused over the entire body, while in other cases it is limited to blotches varying in number and size.

As a rule the skin is somewhat swollen, while the rash produces a burning sensation and frequently intense itching. Either before or simultaneously with the appearance of the rash, an eruption very generally takes place in the throat, accompanied with redness, a swelling of the tonsils, and sometimes with severe inflammation and an exudation resembling that which characterizes diphthoria. The glands of the neck also often become inflamed, and in rare cases the inflammation extends to the ear, causing more or less injury to the sense of hearing. Often there is extreme restlessness and sleeplessness, whining, and irritability; sometimes great drowsiness, dry tongue, great thirst, and frequent delirium. Next comes the peeling off of the skin, which separates in the form of branny scales or in large flakes or patches. In some cases the cuticle of the hand may be stripped off intact like a glove. During this process, which in favorable cases usually lasts five or six days, but sometimes considerably longer, the itching is exceedingly annoying.

Scarlet fever is often of an extremely mild type, and in other cases very severe, death resulting sometimes in a few days or even in as many hours, and occasionally before the appearance of the eruption. An affection of the kidneys is often an accompaniment, but oftener a sequel of this malady, giving rise to coma and convulsions, and leading to general dropsy when it occurs as a sequel to the disease.

In mild cases of scarlet fever, it will be enough to lessen the animal heat by sponging the body, giving cooling drinks, and applying such alleviating remedies as the symptoms may suggest. In severe cases the use of the cold bath is highly beneficial, or the patient should be wrapped in a wet sheet and well covered with blankets until perspiration starts, when he should be washed off in milk-warm water. This should be repeated as often as a very high fever sets in; and in case the fever strikes in suddenly, the patient should be sponged in cold water all over. Rubbing the body with fat bacon or some oily preparation allays the itching and, many think, lessens the severity of the disease. If the symptoms indicate a failure of the vital powers, alcholic stimulants should be used. When the patient becomes convalescent, extreme care should be taken to guard against cold, and thus lessen the risk of disease of the kidneys, which as often follows mild as severe cases of this complaint. No visits should be made, especially by children, to houses where the disease is prevalent, the children of the afflicted family should not be allowed to attend school, and so endanger others, and care should be taken to disinfect or destroy everything which may retain or convey the infection.

Sheep Husbandry.

MUTTON FOR EXPORTATION.

GEORGE GARDNER.

IT is useless to try to deceive anyone with regard to the sheep which are generally slaughtered in the United States. Such mutton would not sell at all in England, and Americans are beginning to find out that they like the common grade Cotswolds of Canada much better than Merino grades, and a great many sheep pay the heavy taxes the United States put on the Canada live stock, having been purchased by New York agents for the best first-class hotels and also for some of the private families on Fifth Avenue.

It is not intended to run down Merinos, for they are acclimated and will also bear neglect and hard times better than other breeds, but it is desired to recommend the crossing of Merino ewes with Cotswolds or other rams of mutton breeds, and go on breeding with thorough-bred mutton rams, which will then bring into existence a very fine quality of mutton and good wool, both of which will be salable in any market at top figures.

The exportation of beef and mutton will do a great deal toward the improvement of meat, and very soon the exhausted soils of the Eastern States will be bought up for sheep walks—as also will be the case, even to a greater extent, with all the South-Eastern States. Capitalists in this country are extraordinarily ignorant of the extensive field now opened for speculation in real estate or they would take advantage of the present opportunity to possess themselves of the old cotton plantations, and thereon grow mutton and wool, for they could make ten times more by wool than by cotton and get all the mutton as a second and extra profit.

I am positively certain if I had the control of a large tract of land that, without the aid of a single white man and without any assistance in buying or selling, I could stock these deserted plantations with sheep and put them in charge of the negroes so as to have sheep husbandry established on 40,000 acres, and in twenty years make more money than A. T. STEWART, JACOB ASTOR and the VANDERBILTS combined; for I would extend till millions would be made annually. There would be great advantage here over the English colony of Australia, yet there sheep are more numerous than in this much earlier settled country.

Statistics have proved that in the South during the last three years, wool has paid 60 per cent for growing, while cotton has not paid more than five to seven per cent, and then it must be recollected the sheep have been managed on such a poor, miserable system that double this amount of profit could be made by an enlightened method of treatment, and mutton of the very best quality sold annually, which would enhance profits far beyond anything the present western sheep owners have any idea of; mutton and wool would produce more millions than cotton ever did.

Dairy Husbandry.

THE OLEOMARGARINE FRAUD.

J. M. PETERS.

WHILE there is much to be said on the side of the consumer in favor of "oleomargarine," or any other artificial product that is sweet and palatable, as against poor butter, none, I think, would care to be imposed upon in buying the counterfeit for the genuine, however superior the former might be. Be that as it may, the statute books of this State now contains a very clear law, looking to the prevention of any such frauds; and it is clearly for the benefit of the producer, if not for the consumer, that its provisions be rigidly enforced. Although the law received executive approval early last spring, no steps were taken to enforce it until less than two months ago. Since then an organization of the wholesale butter merchants has been formed here, and competent counsel has been employed for the purpose of prosecuting violators of the law, while detectives have been engaged to ferret out violations. The work done thus far has demonstrated the fact that the law has been more openly and more generally violated than has been believed, even by those who were the most suspicious of the increasing importance of oleomargarine as a substitute for butter. It would now seem as though much of the dullness in the butter market during the past few months, being caused, as it evidently has been, by a decreased home consumption, might be charged directly to the artificial product. There are hundreds of retail stores in this city where scarcely a pound of real butter has been sold for months, and there are many more where the real and the artificial are both kept, and where every effort is made to palm off the latter upon consumers, inasmuch as it affords the more liberal profit. Then there are hundreds of large consumers, including hotels and restaurants who have been supplied with this product direct from the manufacturers, and who have therefore been turned from the consumption of butter. In most cases these persons have been aware of the character of the goods they were handling, and have been parties to the fraud. There are no means of preventing the deception from being practiced by hotel and restaurant keepers upon their customers, though it is no more than fair that the public should be warned of the existence of the fraud that they may be on their guard against it—provided they have any objections to eating "oleomargarine." The retailers, and all others who sell the product, come within the provisions of the statute, and are required to legibly and durably stamp, brand or label every package or piece of the artificial product — "oleomargarine." Many of them have complied technically with the law, but the stamp used has been so illegible as to really not expose the true character of the goods, and, therefore, not strictly fulfill the requirements of the statute. The number of arrests and indictments has already been large, and hosts of convictions are soon promised by the attorney in charge of the suits. These detections and prosecutions are carried on by the trade, through the organization above alluded to, which they denominate an organization for the protection of dairy products. A fund is being raised for carrying out the objects specified, and as the benefits are to be enjoyed very largely by the producers, it will doubtless occur to many of them that they may, with propriety, contribute to the fund, and lend their moral aid toward securing the protection sought by the association, which involves the passage in other States, of a law similar to the one already in operation here, referring to oleomargarine.

There is one class of violators which can be most effectually detected by the producers, and that class is made up of dairymen who use oleomargarine to mix with their butter. If the percentage of foreign matter is not too great, this fraud is very difficult to detect where the product goes into consumption while fresh, and it is, therefore, the most dangerous and harmful of any violations of the law. Dairies and creameries using the artificial product might be readily detected by watchful neighbors: and the prosecution of a few of them would serve to check the fraud at once, although I believe it has already gained considerable headway. At any rate, there are many producers accused of adulterating their butter and it would be for the benefit of State butter-makers generally to have it understood that there was a vigilant watch kept by all honest dairymen upon those producers who showed any disposition to palm off on the public anything but the pure product of the dairy. Much good has already been done here by beginning this prosecution; but it would doubtless be only temporary if the vigilance of the authorities was allowed for a moment to relax

CATALOGUES, &c., RECEIVED.

THE Illustrated Annual Register of Rural Affairs and Cultivator Almanac for the year 1878—containing practical suggestions for the farmer and horticulturist, with nearly 140 engravings. By J. J. Thomas. Luther Tucker & Son., 395 Broadway, Albany, N. Y.

THE Baltimore Sun Almanac for 1878.

ANNUAL REPORT of the Secretary of the Interior on the Operations of the Department, for the fiscal year ending June 30, 1877.

ALBERT HANFORD'S Texas State Register for 1878.

WHEAT CULTURE in Tennessee. By J. B Killebrew, Commissioner of Agriculture, Statistics and Mines. A valuable treatise of 250 pages.

WE are just in receipt of a copy of three lectures on the Science of Agriculture, by our contributor, Dr. FLAVEL S. THOMAS, A. M., of "Major Farm," Hanson, Massachusetts, member of the Plymouth County and New England Agricultural Societies, and founder of the Hanson Farmers' Club.. The topics pithily discussed in these lectures are: "Farmers' Clubs," "Agriculture in Schools," and "Agricultural Bung-holes." and the treatment of these subjects is marked by the sound common sense, ease, and sprightliness, which distinguish his contributions to our columns.

PETER HENDERSON & Co., 35 Cortlandt St., N. Y. New Catalogue for 1878 of seeds, and farm and garden requisites.

Mr. HENDERSON'S catalogues, besides their lists of flower and vegetable seeds, are always valuable for their originality and trustworthiness. This, however, might be expected from one of Mr. HENDERSON'S experience and enterprise.

THE EUROPEAN OUTLOOK.

At no time during the present European conflict has there been any serious doubt with regard to its issue in the absence of all intervention from other nations. At the outset, it was generally supposed that if the struggle were confined to the actual belligerents, a single campaign would either force the Turks to conclude peace or place the Russian forces in possession or within easy reach of Constantinople. Their unchecked advance through Roumania, the feeble opposition made to their passage of the Danube, and the rapid march of their advance guard, under Gen. GOURKHA, across the Balkans, all confirmed this impression. While the series of reverses they encountered soon after proved that the war would probably be protracted longer than at first anticipated, yet, in view of the vast disparity of the forces and resources of the belligerents, its ultimate issue could scarcely be doubted, even by the most ardent admirers of the soldierly qualities displayed by the Ottoman troops. Indeed, many of the far-sighted friends of the Turks, while proud and boastful of their successes, were secretly apprehensive of their results. Reverses, it was felt, could only urge the Northern Colossus to greater efforts and to the exaction of severer terms at the end; while each triumph cost the Moslems so heavily that there was serious risk of a sudden collapse whenever the accumulated reinforcements of their opponents should enable them to turn the tide of war. The course of recent events goes to prove that these apprehensions were not groundless. So uniformly successful have been the movements of the Russians of late, and so overwhelming the number of troops they have brought into the field, that had not a winter of unusual severity temporarily checked or entirely suspended military operations, it is not improbable that the Muscovite troops would by this time be swarming through the Balkan Passes into Roumelia. Once south of the mountain range, there does not seem to be force sufficient to check their triumphant march on Adrianople.

For years it has been the general opinion across the Atlantic that the final settlement of the Eastern Question would involve an extensive, if not a general, European war. At the outbreak of the present hostilities there was imminent risk that other nations would be drawn into the struggle, and this risk will recur with greater urgency whenever the conditions of peace to be imposed by Russia shall be made public. The interests of every European nation are more or less involved, directly or indirectly, in the settlement of the conflict. It is not likely, therefore, that Russia will be permitted, without vigorous protest or even intervention, to impose on the vanquished Turk terms that would seriously affect the safety or prosperity of other nations.

Great Britain is specially interested in this matter. Between her and Russia there has been for years a growing rivalry for influence and supremacy in Asia. Both have there been extending their empires, the one from the north, the other from the south, until they have nearly come into contact, and British statesmen have long been persuaded that contact there will inevitably mean conflict. Russia, paramount at Constantinople, could at any time impede or block her rival's most direct route to India and constantly endanger the richest possession of the British Crown. It was dread of this danger that led England into the Crimean war, and it may also force her to take a hand in the present struggle. Already she has 80,000 troops ready to be thrown into Turkey within a month, her arsenals at Malta, Gibralter and at home, are abundantly equipped with munitions of war of every description, and although among her politicians and people there is a large element anxious for peace at any price, yet the bulk of the nation are evidently resolved that their possession of India shall not, without a struggle, be endangered by the results of the present conflict. And should Great Britain become embroiled in the conflict it is by no means improbable that other countries will also be drawn into it.

ARE PLANTS HEALTHY IN SITTING ROOMS?

That is, are rooms in which plants are kept more healthful or less healthful than the same rooms without such plants?

To answer this either one way or the other, it would be necessary to know how many and what plants are kept, and how they are kept; the size of the room and the exposure to sunshine and light, and finally, how the room is heated. We believe that plants, as they are generally kept in sitting-rooms, are positively injurious to the health of the inmates. Such plants are never healthy. Scarcely one condition of a healthy existence is provided them. The heat of the room is always changing, to suit the people, not the plants. At night the temperature is generally too low, and oftentimes the air is impregnated with deleterious gases that escape from stoves or heaters that are fixed to last through the night.

Sunshine, the first necessity of their healthy existence, flits by them like a savory odor by a hungry man. The soil of the pots in which they grow, is almost always too wet or too dry. In the former case, they are like so many stagnant pools that no doubt generate, though in minute portions, poisonous exhalations; and the same may be said of the green, slimy substance that too often is permitted to collect upon the pots and remain for weeks at a time.

If plants are healthful in sitting rooms, it can only be because they liberate more oxygen than they consume. But this is true probably only of plants in vigorous growth; and the house plants of which we speak, instead of growing vigorously, are rather in a slow decline that, if permitted to continue long enough, would end in their death. We are fond of house plants. They invest home with an interest that nothing else can supply. But unless the pots are frequently and thoroughly washed, unless they are amply drained and the soil used so "light" that it cannot become "sour," we should answer our question in the negative.

WAS HE SUCCESSFUL?

We know a farmer in a Western State who made $30,000 on his farm by the time he was fifty years of age. How was it done? He bought a large farm when land was cheap. The land was of excellent quality, and he paid for it all. He kept out of debt, or nearly so. He had an ambitious wife who worked hard, raised a large family of children, and died in middle age. The man had a strong constitution, and did the work of two men. He was up early and late, and always took the lead and planned the work well for his men. He cultivated his land thoroughly, and did everything well. He was not very particular about fixing things up in style. The front yard was not expensive. He had a good vegetable garden, a fair orchard, good barns, and a plain, comfortable house. He bought good tools, kept them in repair, had plenty of them, and housed them, even to sled-stakes and hand-rakes. He always kept young stock growing all the time till they got their growth or were disposed of. His boys and all the rest of the family worked hard. When about fifty years of age, he sold his farm, moved to a village, lost $6,000 to $10,000 in some stock companies. He does not want to go back to his farm. None of his boys have any desire to be farmers—they can make money in trading or in other business. After giving the facts, we leave the above question for each reader to decide for himself.

PROTECTING TREES FROM MICE AND RABBITS.

Next spring we shall doubtless have numerous inquiries as to how to preserve gnawed trees. There are several popular remedies to keep rabbits away, and some to keep off the mice; but we know of none better than the following, which we have seen extensively tried, with complete success:

In autumn, wind the trunk of the tree up to the branches or higher, with coarse paper, about which wind a layer of tarred paper, and tie with a string. Heap a conical mass of earth fifteen inches high about the base of the tree, and there will be no danger from mice or rabbits. Tarred paper next to the bark may injure the tree, hence the inner layer of coarse paper which contains no tar. These materials are easily obtained, and the whole cost of labor and material will not much exceed one cent for each tree. The man who will not attend to the preservation of his trees at the proper time, after he has been told a cheap and effective way, does not deserve much sympathy if his trees are found "barked" in the spring. We have known trees to be lost, which had been rubbed with liver, perhaps because the work was not thoroughly done. The same might occur if the trees were rubbed with the blood and flesh of a rabbit.

NOTES.

Our Seed Distribution.—We have worked hard to get all of the seeds mailed to applicants before the New Year and have measurably succeeded. Less than one thousand orders remain unfilled at this time, and these will be attend to in a few days. There is one objection to such arrangements. It is that owing to illegible writing, to carelessness or thoughtlessness on the part of the applicant, we are unable to fill many orders. Of course we are blamed! We have received some addresses (?) without the State—some without the town, several without any name. A number written in pencil, have been so blurred when they reached this office that they could not be read. With such exceptions, we have filled all orders save the thousand above referred to, and those of our subscribers who having applied for the seeds, have not yet received them and do not receive them within the next ten days, will be fair enough to questioning whether the neglect may not be their own. Our next seed distribution to subscribers will be announced within the next six months.

Plowing by Steam experience has proved to be a very economical method of tillage by the large farmers and landowners, not in England only, but also on the Continent. American agriculturists pride themselves not a little on the extensive use of labor-saving appliances; yet steam plowing, despite the successful results of a long series of experiments elsewhere, has still to become a feature in American agriculture. Is this drawback due to lack of capital or lack of enterprise? In view of the large income of some of our Western farmers, we cannot ascribe it to the former cause, and yet our acquaintance with the enterprising spirit of our agricultural friends will hardly allow us to attribute it to the latter.

Spitting in Railway Cars.—In many portions of the West, writes one of our contributors, passenger-cars are often rendered disgusting in the extreme to a person of refinement. The RURAL may give a good hint and help to reform this disgusting practice by printing a copy of a placard which may be seen conspicuously posted in the clean coaches of the Boston and Providence Rail Road. "Passengers using tobacco, or having occasion to spit are requested to take seats in the smoking-car where they can indulge themselves without being a nuisance to the ladies and other decent inmates of this car."

BREVITIES.

DANDELIONS are blooming.

SUBSCRIBERS will do us the favor to bear in mind that the RURAL NEW-YORKER is discontinued after the expiration of the subscription term.

WE call attention to the article of Prof. CYRUS THOMAS on the Potato Beetle, which modestly fills up a little blank in the history of this distinguished American.

Now is a good time to "turn over a new leaf." It is also a good time to subscribe for THE RURAL NEW YORKER. May not two birds be killed with one stone in this way?

PROFESSOR STOCKBRIDGE says that the man who plows adds food to the soil for plants; that heavy soils should be plowed in the fall—light soils in the spring; that in plowing, only an inch or so of the sub-soil should be brought up annually.

AN EXHAUSTIVE TREATISE.—Just as we are going to press, we have received what appears to be an exhaustive treatise on wheat culture in Tennessee, by J. B. KILLEBREW, Commissioner of Agriculture for that State. We have only had time for a cursory glance through its 255 pages, but we shall return to the subject therein discussed when leisure permits us to study it more carefully.

THE northeastern Bee-Keeper's Association will hold its annual meeting at the City Hall, Syracuse, N. Y., on Feb. 6, 7, 8. Among other subjects of importance to bee-keepers which will then be discussed, special mention may be made of an essay on Recently Discovered Parasites of the Honey Bee and their Connection with successful wintering, while the subject of maketing honey will also receive special attention.

IT is usually recommended, after having falls of snow the weight of which bends down and sometimes breaks the branches of evergreen trees, to go about and beat the snow off. If it is very feathery and the individual a very careful workman, this may be a good plan. We have, however, known more injury to be wrought by carelessly brushing off the snow than the snow would have effected, had it been left to itself, through several winters.

THE ILLINOIS INDUSTRIAL UNIVERSITY will hold an agricultural Institute at the University, situated between the cities of Champaign and Urbana, commencing Monday, January 14th, and continuing until Friday evening, January 18th, 1878. The main feature of the Institute, which is a part of the work of the College, consists in a specially prepared course of lectures by members of the Faculty and prominent agriculturists of the State. There will be no charge or fee of any kind. Visitors will have access to the libraries, cabinets, and museum of the University. The hotels at both towns will entertain at a reduced price, and the Illinois Central, Wabash, and the I. B. & W. Railroads will reduce their fares to those wishing to attend the meetings.

FROM the results of Sir JOSEPH HOOKER'S travels in the United States, remarks an English journal, further contributions to our knowledge of the physiology of plants may be expected. And Punch adds: "Yes; and especially from the experience he may be supposed to have enjoyed at New York—a location so celebrated for producing that peculiar class of plants growing, like certain mysterious cryptogams of the toadstool family, in Rings." The Athenæum says: "Sir J. HOOKER is, we believe, of opinion that the key to the botany of the U. S. is to be found in Colorado." To this Mr. Punch remarks: "Of course, the Conservator of Kew Gardens must know where to find the key of Botany. But in the public mind just now, Colorado is less intimately associated with Botany than with a sister science. Between its Botany and its Entomology, however, Colorado seems likely to acquire a scientific importance."

Literary Miscellany.

THE DEAD VIOLET.

WHERE is the hand that gathered it, the violet fresh and sweet,
From its nest 'mid the dewy mosses that clothed the great oak's feet?
Alas for the eager fingers!
They handled the sword-hilt well;
But they could not guard the bright young head
That found a soldier's gory bed,
When the vines were crushed 'neath the guardsman's tread,
And the night over Alma fell.

Where is the smile that welcomed it with her gallant lover's vow,
And placed it amid the golden braids that crowned her fair young brow?
It is carved on the lips of marble
Of the statue that marks her rest,
As she lies alone in her maiden grave
In the great cathedral's solemn nave,
Where the organ's voice, like a rolling wave,
Flows over her virgin breast.

Leave the violet in the volume of the old romantic rhyme—
Pale symbol of love that has passed away, dry pledge of a sweet old time!
What would avail to place it
Again in the soft green grass?
The old oak, felled, 'mid the moss is flung;
The tale is told and the song is sung;
Let it molder the moldering pages among;
So does youth, love, and spring-time pass,

[S. K. *Phillips*.

HER MOTHER'S SECRET.

CHAPTER V.

The Elopement.

[Continued from page 423.]

"IT will be necesssary to follow me carefully in order to understand all that followed.

"We were to meet on the river bank, and go in the boat to a landing, where a close vehicle would await us.

"A female would be in the carriage, and she and I would drive to the spot where we were to be married.

"I sighed deeply as I parted from my poor aunt and Mr. Linton, whom I never expected to see again, and went up to my room.

"I put on a neat traveling-dress, and that is all, going down thus accoutered to the garden, where Arthur Mortimer—as such I knew him—awaited me.

"We entered the boat, and were speedily rowed to where the carriage was posted. A very respectable woman stood near the vehicle, which I entered with her, and was driven off through the night for about an hour, having gone forward on horseback.

"We reached an inn. Now commenced the chief cause of my after perplexities.

"In my terror and confusion—for I was afraid and confused—I thought of nothing. I never heard the name of the hotel we stopped at, nor the town where we were married.

"The ceremony, all being ready, was performed in a church, the door being open, and several persons looking on.

"The minister gave us a copy of the certificate of marriage, which my husband put in his pocket; and, entering a post-chaise, we gave ourselves up to the ecstacies of happiness.

"I knew nothing of the road we took, except that it wound a good deal amid woods and picturesque scenery. Then we reached a small Italian villa, where we found everything prepared by my husband, one female attendant for myself, a cook, and his own man.

"Now commenced a life of happiness, which I must say never changed while we were together.

"My husband was necessarily absent for some time to attend to his regimental duties, and to keep our secret.

"Thus passed six months, when he came home, looking harrassed and pale.

"'What is the matter?' I asked, eagerly.

"'I must leave you for a week! It is an important summons to London. I really cannot make out what it means. Be careful of yourself,' he said, gently and kindly, 'and do not go out until I come back.'

"It was not likely, as I had no acquaintance; but I promised all the same.

"A very handsome present he had made me in the first week of our marriage. It was an inlaid desk, in which I had collected a few hasty notes signed 'A. M.,' some bouquets, and other trifles, which to me were invaluable.

"'Ah, Alice,' he said, rather gravely, 'whatever you do, take care of that! It is more valuable than it looks.'

"I have remembered the words ever since, and thought there was a hidden meaning in them; but I was wrong—the desk only contained what I had placed there myself.

"We parted next day early, I insisting on rising to make the breakfast. He went away, and from that day to this we have never met."

The doctor and Edith looked ominously at each other.

"The days passed, full of hope and joy, when, one day, my servant announced, with rather a peculiar face, that a gentleman wished to see me.

"Thinking he might come from my husband, I bade her admit him. His card bore the name of Major Cameron.

"He entered in a jaunty kind of way, that astounded me at once.

"'Did you come from my husband?' I asked.

"'Husband,' he said. 'What husband?'

"'My husband,' I repeated angrily, 'Captain Arthur Mortimer. I am Mrs Mortimer.'

"'There is no such captain,' he cried, 'and therefore there is no Mrs. Mortimer. You have been deceived by a rascal, who has now utterly abandoned you—whom you will never see again.'

"I stood annihilated, wholly unable to speak, scarcely able to stand.

"'It is false!' I cried at last. 'It is a vile calumny! My husband will return and refute it.'

"'Never!' he said, insolently. 'I have purchased the place as it stands, and I give you until to-morrow to leave—unless, indeed, you like to remain with me.'

"This was said with such unctuous insolence that I could have struck him.

"I bade him stand aside, that I might leave the room.

"Have you no marriage certificate to show?' he asked, not allowing me to pass.

"'None," I replied.

"He rubbed his hands, and let me go.

"'I packed up my few things, especially my desk, and then got from the woman who waited on me some idea of where I was.

"My husband, as I still believed him to be, and as I shall to my latest hour, had left me ample means,

"I procured a fly, drove to the nearest town, where I found a coach that drove through the town where my aunt resided.

"Yes, in my distress, I was going home to my aunt. It was ignorance of the world, it is true; but what else could I do?

"It was night when I reached the old place, and the coach put me down at the door. I gave a feeble knock or ring, and a man put my things in the hall.

"Then the old attendant gave a great scream as she rushed into the parlor.

"'Miss Alice come home!' she cried.

"My aunt appeared on the threshold, and gave me a withering look. She was much aged, and leaned on a stick.

"'Woman,' she said, in a harsh voice, 'what want you here?'

"'Aunt, if I have sinned towards you, I have repented; but I have not sinned——'

"'Begone!' she cried.

"'At least hear me!' I urged, piteously.

"'No; leave my house,' she said, 'or I will have you thrust forth!'

"'Not to-night,' put in a gentle voice, that of Mr. Linton, 'not, at least, until you have heard what she has to say!' And, offering me his arm, he calmly led the way into the parlor, where a cosy tea was laid out, of which he made me partake.

"Then refreshed and encouraged, I told my story, to which he listened without interruption, though my aunt's severity did not relax.

"When I had finished, the excellent man spoke.

"'That the poor child has been married I have no doubt,' he began; 'but the whole thing has been so cunningly managed we shall have some difficulty to prove it.

"'That is what I fear.'

"'You have no idea of the church,' he continued, 'and you are told that this officer and gentleman adopted and assumed a false name. All this can be searched into. But what do you intend to do? he said, addressing himself to my aunt.

"'She cannot remain here,' was the cold reply, 'after what has happened. I should be pointed at with the finger of scorn. As I believe the poor girl has been wronged, I shall provide for her.'

"'That is like my old friend!'

"'But while you are looking for this rascal,' she continued, 'she must live in retirement. The best thing to do will be to assume a widow's garb,' she said, with peculiar significance, 'and a false name. Until she find her husband, I will allow her two hundred a year.'

"'Very good,' said Mr. Linton, stopping any objection on my part.

"'If she never finds him, which is most likely, she shall have an annuity of the same amount.'

"I at once removed to a village at no great distance, where amid sorrow and tribulation, my daughter was born.

"Meanwhile, Mr. Linton had not been idle.

"He had looked far and wide for my marriage certificate, and could not find it.

"Then he searched for the house in which I had lived. He found it, and discovered that the man who had frightened me away had left within half an hour of my departure.

"My husband came home a week after, and heard I had eloped with the Major.

"I presume he believed it of me—Heaven forgive him!—and so forsook me forever.

"Was it a plot of that dreadful man, or was he an agent of the father, who had discovered our marriage?

"How can I tell now?

"But the approach of death often makes us see more clearly, and I believe that I was legally married, that my husband dearly loved me, and that we were separated by some treachery.

"Had we found him, we should have discovered the mystery of the the name. I never saw my marriage certificate, and how do I know what he signed, any more than the name of the church?

"I never saw the license, and I am sure never heard a word of the service, or knew what the parson said to me.

"I shall die in the belief that he intended me well.

"I leave my daughter a thousand pounds invested in good mortgages. Mr. Linton has seen to all that, as he has attended to all my affairs since the birth of my child.

"Once he wanted me to marry him, saying my child would have a father. I declined, first, because I have never loved but once; and second, because my husband may still be living.

"As soon as I am no more, my child must go to London.

"Let her take the inclosed letter to Mr. Linton, and do as he wishes.

"I have brought her up, with the aid of my little means, to earn her own living.

"Should my child ever meet with any one she grows to love, never let her marry clandestinely. Let it happen openly, in the light of day, before his friends and her friends, if she have any."

"Oh, mother!" said Edith, falling on her knees, "I have deceived you very much! I am engaged to be married to Royston Yorke!"

There was a fearful silence for some minutes.

"Give me a strong dose!" cried the anxious mother. "I should like to hear all about it before I die!"

The doctor obeyed, and Edith, with tears and sobs, told her story.

"At all events, no harm is done," she said, with a sigh; "but don't expect much of him, as you have not heard anything. Poor Jack; this accounts for his jealousy, and the coolness of his parents. Finish reading my letter."

"But I wish her, in all things," continued her mother, "to defer to the opinion of Mr. Linton. He will advise her for the best, and be her friend."

"Should Heaven bring you face to face with your father, say I died believing in and blessing him.

"Heaven bless and guard my child, who, since I lost him, has been to me the one earthly blessing.

"ALICE MORTIMER."

"This is a most remarkable history," said the doctor, "and I do believe, my dear madam, that there is some warrant for your confidence. Did you never have a portrait of your husband?" he added, musing.

"He showed me a medallion, which he intended to give me," she faintly answered; "but what he did with it I know not. I was too happy with the original to ask for the faint presentment. And now I will rest."

"You will do the same, Miss Edith," urged the doctor, or we shall have you ill."

"I will not leave her," said Edith, quietly.

And they had to yield to her.

In the morning there was wailing and distress. The spirit of the excellent woman known to the people of Longmead had passed away.

CHAPTER VI.

The Funeral and Departure.

THERE were several persons to call upon Edith—even the Claytons coming, now that she was in sorrow and trouble.

She saw no one but the doctor and the rector.

A week after the funeral, everything being sold up except her personal effects, a few relics and the desk, Edith took her departure into the wide world, accompanied only by Gale, who said she had friends she wanted to see. Of course it was pious fraud to accompany the young girl, but that was the poor woman's business.

On reaching London—which seemed to them a wilderness, a waste—they found a coffee-house, and put up there for the night.

As soon as they thought the hour propitious, they hired a cab, after locking their things up in a room, and drove to Chelsea, where Mr. Linton lived in an old-fashioned house in Cheyne Walk.

A HAPPY NEW YEAR!

He was a connoisseur, a great judge of pictures and such things, and his house was a perfect museum of art. He loved books, too, both for their outsides and in.

He was lonely, poring that morning over some volume of forgotten law, when his "female Cerebus," as he called her, announced a woman and a young girl.

"Who are they?" he said.

"They will not say," she replied, "but the young girl, who is in deep mourning, says she has a letter of introduction."

"Send them in," he answered.

He stood watching; and, as the lithe, sweet figure in deep mourning came into his presence, he started forward as if to take her hand.

"This is a letter from my late mother, Mrs. Marshall," she began, tearfully.

"From Alice Estecourt, at last!" he said, mournfully. "She said it would come soon. Be seated, my dear girl, while I read. Mrs. Gibson, let us have lunch directly."

The letter was soon read, and then he spoke.—[To be continued.

ROSEMONT.

BY PANSY.

BEAUTIFUL, oh, so rarely beautiful! Away beyond the massive iron gates stretches a smooth, level lawn, of the softest, brightest green. Noble elms and sturdy oaks mingled with trees of lighter form, and shrubs of symmetrical build and beauty dot the well-kept lawn, and cast cool, lengthening shadows on the velvet grass beneath. The rustic seats, and chairs of fanciful pattern scattered here and there in shady nooks; the large marble vases holding exquisite plants and rare vines; and the well-kept gravel-walks winding through the lawn, show the owner to be a person of means and cultivated taste. A sharp turn in the walk brings the house in view, and we stop spellbound by the vision of beauty which bursts upon our sight, most fittingly named "Rosemont!"

Before us is a lovely Gothic cottage, almost hidden by the profusion of roses which clamber and limb, twist and twine, around its pillars, porticos, windows, and doors. Roses, roses everywhere—great creamy-white beauties, rich sulphur, pale straw, deep crimson, delicate blush, are Provence, bud, blossom, full-blown of every sort, kind, and in every form. At the right a small fountain flashes in the clear sunlight; in whose marble basin stately callas and strange water plants mirror their green leaves in its crystal water, and myriads of tiny gold-fish dart, dive and sparkle.

A true September haze filled the atmosphere and veiled the far horizon; a sense of peace and quietness pervaded the air, as though nature was resting, secure and contented, from her labors; while the sun seemed to shine lovingly and brightly on this charming retreat.

On the dim, cool, shady verandah, a young girl lies, lazily swinging in a hammock. The soft, perfumed air gently stirs the masses of wavy hair so gracefully arranged around the small, queenly head, upheld by one dainty hand; and the bright, roguish eyes fixed on the fair scene, have in them just now a dreamy, far-away look. "It seems so strange there should be so much sorrow, wickedness and misery in the world—surely, they can never enter our beautiful home! I question if Eden ever could have been more gloriously lovely!" she mused. Little did the happy, joyous girl know of the dark cloud so soon to envelop her in its misty folds.

That NEVA GERMAINE was wondrously beautiful, and that she was as lovely in mind and disposition as in person, no one denied or disputed. Barely medium size, slender and graceful as a fawn, a delicate oval face framed by bands of wavy brown hair; low, broad brow, small Grecian nose, a dainty mouth with dimples shy and sweet lurking in the corners of the full red lips; and a pair of the sauciest, sweetest, softest, most laughing brown eyes you ever saw, completed her picture.

Orphaned at an early age, she was adopted by a wealthy uncle, wifeless and childless, who gave to her the place of his lost idol. Spirited, loving, witty and wise; proud, yet not haughty; tender and true, she won her way at once into one's heart of hearts.

On her return from school, two years before, her uncle fitted up this place for a summer retreat where she, in the joyous calm of her girlish heart, fairly reveled; and to which he turned at nightfall from the crowded city, as a traveler turns from the burning sands of a desert to cooling shades and flowing springs.

Down the long, dusty road, over the hot white sands, clattering and clashing over the stones, a hasty rider dashes to the gate, tosses something into a young lad's hand, and is away like the wind.

Aroused from her reverie by the sound of hasty steps, NEVA slightly raised her head to ascertain the cause. As she did so, the boy approached, and laid in the fair hand, outstretched to receive it, a telegram.

Springing from the hammock, and tearing it open, she read:

"Your uncle is dead. The body will be at Rosemont at 8:30 P. M. L. D. LEWIS."

"Dead!—dead!" she gasped. She gazed around with dilated eyes, into which a horror had swiftly crept; and as the terrible truth burst upon her, she sank down, crushed, silent, benumbed by the overwhelming sorrow which rolled its dark waves over her. For hours she sat powerless, motionless, her loving heart wrung with anguish; until the old housekeeper, coming to ask some question, found her nerveless, calm—the very fountain of her tears frozen by this great grief.

On the following day NEVA, attended by a few old-time friends of her uncle and a motley crowd of the country people, paid the last tribute of love and respect to the memory of her loved uncle, tenderly laying the precious dust in the bosom of our common mother.

Mr. GERMAINE, had intended that his adopted child should inherit his vast wealth but by one of those strange perversities of men about such matters, had delayed the necessary steps until too late. Near the close of the solemn day, the old family lawyer requested an interview with NEVA. He told her briefly that years before her uncle had confided a will to his care and that it was now proper it should be opened and read. NEVA never forgot the dim, old library, lighted by the golden gloss of the brilliant sunset, or the oppressive stillness of the room, broken only by the deep voice of the lawyer, as he told her that she, the loving, cherished, petted child of her uncle, was friendless, homeless—alone,—the beautiful home she loved so well, was a stranger's and she an alien. Gently expressing his sincere regret for her misfortune, and sorrow that the property must pass to a distant cousin, and proffering his aid to her if needed, he left her alone with her redoubled sorrow. Long and lingeringly she gazed over the well-known home, every object telling of the love, generosity, taste, and thoughtful kindness of him who had placed them there; every plant, shrub and flower reminding of happy, joyous hours gone beyond recall. At length she hid her face in the soft velvet cushions, and prayed. What it was that went voicelessly up, to the great, shining Throne, need not be told, but it was full of agony and supplication for help and when the little head was raised again, the eyes were bright and shining, full of hope, and the set lips indicative of a rigid determination and purpose.

Only God knows the terrible anguish tugging at her heart's strings, as she bade adieu to her home with its cherished associations to the mound which covered her more than farther, and turned her way out into the wide world alone. Ah! little did she know of the dark, lonely paths her little feet must tread, the cruel thorns of heartlessness which would pierce the tender hands; the insults and annoyance to which her fatal dower of beauty would subject her. At nightfall she reached a well-known city, and with difficulty found a quiet lodging from which she might search for employment.

At school, her masters in painting united in praising her talent and wonderful skill in that art, her taste for which amounted to a passion. When the first shock of her misfortune had passed, and she began to cast about her for some source of support, she at once determined to turn that talent to advantage by becoming a teacher of her loved art.

In her limited knowledge of human nature, gleaned from the experience of her sunny life of nineteen happy years, she doubted not the willingness of old friends to assist her in her purpose. Day after day, she sought friends of former times, stated her position, and solicited their patronage receiving scorn, neglect, and haughty refusals; finding them indeed "summer friends."

Night after night, footsore and weary she reached home with a discouraged heart, and a sad conviction of the selfishness, and hollow-heartedness of human nature.

Day by day she haunted art galleries, passed up and down the busy thoroughfares searching for something to give her a foothold; receiving jests, jeers and coarse remarks upon her appearance, which shocked her refined nature, and filled her timid, shrinking soul with fear. Months passed. Her money, jewels and clothes were gone; want stared her in the face; starvation, death seemed not far away. The beautiful bloom had fled from her cheeks; great, mournful shadows circled the weary eyes; and a tender, pathetic sadness settled about the perfect mouth, from which the dimples had fled. Shall she despair and give up the struggle? No, never! "Every cloud has a silver lining," and He who wove it, knows just when to turn it out.

Possibly this cloud, impenetrable as it seems, ere long may burst, and through the fissures the golden sun come streaming,—the more welcome, because of its long delay. As a last resort, she called a second time at a popular art-store, and asked for employment. With words of refusal upon his lips, the proprietor turned, when his attention was arrested by the piteous pleading of the beautiful face. Instantly there flashed before his vision the memory of another such face, dear to him, now resting beneath the violets; and briefly putting a few questions, he requested her to call the next morning. NEVA came early the next day. The proprietor led the way to a small studio, and, to test her skill, gave her a small landscape to copy. Nerved by her great need, and aided by a strong determination, she not only finished the copy, but improved upon the original, to the astonishment of the artist himself. Encouraged by the remuneration given, and by the prospect of steady employment, catching faint glimpses of the "silver lining," she began to feel that the deep waters were becoming more shallow, and that she was nearing the shore.

Her enthusiasm for her art caused her spirits to lighten, and she began to think the wheel of fortune might sometime be reversed. Some few months after, a gay party were "doing" the gallery. Apart from the others, lingered a tall, dark man, apparently twenty-eight or thirty. The flashing eye and interested air betokened him more of an enthusiast in art than the others. Traversing the rooms, he came upon a scene which rivaled all others, and held him silent in admiration.

In a small room at his right, upon an easel rested a magnificent Madonna, bright and glowing, with its rich coloring, and apparently just finished. Before it sat a young girl, the artist. The slender form clad in deep mourning was slightly bent forward, and so still, so calm and motionless, she seemed scarcely breathing. The slight delicate hands were resting, closed, upon the lap. The small head thrown lightly back, and on the perfect features a look of mingled mournfulness, and restful peace reposed. A tender, pitying expression crossed his handsome face. Quietly retracing his steps, he inquired the name of the lady, receiving no small shock when the proprietor (an old friend) told him; he recognized a name the owner of which he, for many months, had been engaged in looking for. NEVA having finished her work came slowly down the long gallery, and as she stopped to speak to her employer, the gentleman (NIEL MURRY) asked and received an introduction. Shy and timid as a fawn, she avoided him at all times, and he, with a delicacy equal to her own, did not intrude. Each morning she found on her easel, as proof of this kind interest, a bunch of lovely flowers. Slowly, steadily, he overcame her shy avoidance of him, by his noble, manly bearing, until she learned to respect and esteem him. Unconsciously did he win upon her, until she learned to look to him as a protector, to watch for his coming with pleasure, to listen to his voice; telling her of his utter loneliness in the world, of the death of a far-off cousin who had left a vast property to him, of all his thoughts, hopes and feelings; and in turn winning from her the story of her trials, and at last telling her of the deep, love filling his heart.

Quietly they were married one bright morning in June, and took the cars for his home (a place left him by his uncle he told her). As they neared its vicinity, she noticed familiar landmarks of her old home, and flood of bitter memories rushed upon her, but as they alighted at the familiar station wonder and surprise filled her heart.

Within the carriage, her husband tenderly drawing her closely to him, told her he was the cousin, to whom her uncle had left his property, that he was the stranger who had driven her from her lovely home. Telling her how he had returned, intending to deed all to her, and finding her gone, had searched steadily and unsuccessfully two long years for the missing girl, and at last, accident led him to the art-gallery where he found his reward. Holding her close to his heart, he pressed a long, lingering kiss on the sweet lips, and welcomed her to Rosemont again. During his strange narrative NEVA felt that indeed the cloud had burst, and through the rifts the sun poured in dazzling radiance o'er her; that for all the sorrow she had endured, threefold joy was returned, and a silent prayer went up to the good Father for his wisdom and guidance through the darkness, into perfect day.

BEDS.

ONE of the best riddles in the English language is on a bed:

Form'd long ago, yet made to-day,
I'm most in use whilst others sleep;
What few would wish to give away,
But fewer still would wish to keep.

While all people enjoy their beds, and look forward to them every evening of their lives as a rest after the toils of the day, as a refuge in sickness, a comfort in health, a place to be born in, and a place to die in, how various are beds—how much do people of different habits and different nations differ in their notions of what constitutes a comfortable bed!

It is curious to notice the habits of different nations in regard to beds. However dress, food, manners, cooking, political conditions, may vary in other countries, the beds differ as notably as anything does. In Eastern nations the bed is often nothing but a carpet, and is carried about and spread in any convenient spot, and the tired native lies down in his clothes. I remember a child who used to be puzzled with those miracles of our Saviour, who, in restoring an impotent man, directed him to take up his bed and walk—his idea of a bed consisting in a four-post bedstead, with its pallaisse, mattrass, and featherbed, besides blankets, sheets, and pillows. But even in very cold countries the beds are closely allied to the Eastern carpet. In taking a furnished house in Russia, on inquiring for the servants' bedrooms and beds, it comes out that the Russian servants are in the habit of lying anywhere—in the passage, on the floors, on the mats at the room-doors, or even on the carpets in the sitting-rooms—generally as near as possible to the stoves in the winter season. But in Russia the houses are kept so warm, by the system of stoves through the walls, that much bed-covering is no more required in winter than during the heats of summer.

In Germany the construction of the beds gives one the impression that the Germans do not know what it is to lie down. The bedstead is a short wooden case; there is a mattrass extending from head to foot, but so formed that at the half way, the upper end is made to slope at an angle of considerable elevation, and upon this are two enormous down pillows, which reach from the head of the bed to the half way down to the feet; consequently the occupant of the bed lies at an angle of at least forty-five degrees, and is nearly in a sitting position all night. In some parts of Germany there are no blankets; there is a sheet to lie on, and another over it, which is backed to a quilt wadded with down; and this is the entire covering, with the exception of a sort of bed, a thick eider-down quilt, but not quilted, which is placed on the top, and which, unless the sleeper is very quiet in his sleep, is usually found on the floor in the morning. In hot weather there is no medium; either a sheet is the only covering, or one of those over-warm eider-downs.

As the traveler proceeds more and more northerly, the size of the beds seems to decrease, and the covering provided to be less adapted to the changes of the seasons. Curtains to beds are rarely or never met with in Germany or in Russia.

While the bedsteads dwindle down to the smallest possible size in the northern parts of Europe, in the parts of North Italy near Como and Milan are found enormously large ones.

Beds have been stuffed with feathers, wool, horsehair, what is called flock, which is an omnium gatherum of all sorts of productions, shavings, hay, straw, and in the south of Europe with the soft and elastic dried leaves of maize; dried seaweed has also been used, but, pleasant as it was when perfectly dry, the sea-salt abiding among it attracted the moisture in every direction, from the atmosphere, from the perspiration, &c., and it became damp and unpleasant. In one of the seasons when hops were abundant in England it is related of a farmer that he sold the feathers from all the beds in his house, and replaced them with the hops. In another year or two, when the hops failed, and the price became very high, these same hops were disinterred from their beds, and fetched a considerable sum, far more than sufficient to replace the former feathers. History does not say whether the farmer's family slept more soundly for the hop beds, or whether the hops thus preserved were found to have any peculiarly fine flavor when made into beer.

There is no doubt that a vast number of people in health—we say nothing of invalids—lie too long in bed. It may also be said that they sleep too hot, as well as too long, to be likely to preserve health and live to a good old age. It has been long known that those who have far exceeded the ordinary length of human life, whatever their other habits may have been, have been early risers; also, that very old people who keep their health usually have slept with very little bedcovering. Young children and people with feeble circulations require more clothing than others, but only at first; and when once warmed, they would become too hot, their sleep would be broken or unrefreshed, unless some of the extra clothing were removed.

The exact character of beds, and the fitness of them for the comfortable repose of their occupiers, will much depend on the habits of nations, and what may be held to constitute comfort, which will vary with individuals. A Persian ambassador was once shown into a bedroom, where a grand canopied state bed had been prepared for him. He supposed it was a throne in his audience chamber, received his visitors seated on it, and retired to sleep on the carpet in the corner of the room.

Open windows through the night are by many considered dangerous, and that is a prejudice to some degree founded on truth, that night air is unwholesome.

One may refine to any extent on the luxuries of beds and bedrooms for those who have the means, but, for the good of the whole community, certain correct principles as to sanitary arrangements are fully recognized, and are rapidly coming into use. Each nation will have its own ideas of comfort, but throughout the world health is equally important, and the rules which will preserve it and promote it cannot be too extensively known or more powerfully recognized.

To habitual invalids, still more to healthy, active people confined to bed through some accident, the bed is an important matter, and not only comfort, but health and life may depend on the power of obtaining sleep; and to such the observations in this article are addressed. A healthy man, actively employed through the day, with no cares to agitate, and no irritable nerves, can sleep, and soundly sleep, anywhere; though the shepherd's boy said he never knew what it was to enjoy a good night, as no sooner was his head on the pillow than it was time to get up. R.

A DARING FEAT.

DIRECTLY opposite the Winter Palace, in St. Petersburgh, and one of the most conspicuous objects on the whole line of the Neva, is the citadel or old fortress, and in, reality the foundation of the city. I looked long and intently on the golden spire of its church, shooting towards the sky and glittering in the sun. This spire, which rises tapering till it seems almost to fade away into nothing, is surmounted by a large globe, on which stands an angel supporting a cross. This angel, being made of corruptible stuff, once manifested symptoms of decay, and fears were entertained that it would soon be numbered with the fallen. Government became perplexed how to raise it; to raise a scaffolding to such a hight would cost more than the angel was worth.

Among the crowd which daily assembled to gaze at it from below, was a roofer of houses, who, after a long and silent examination, went to the Government, and offered to repair it without any scaffolding or assistance of any kind. His offer was accepted; and on the day appointed for the attempt, provided with nothing but a coil of cord, he ascended inside to the highest window and, looking for a moment at the crowd below and at the spire tapering away above him, stood on the outer ledge of the window. The spire was covered with sheets of gilded copper, which, to beholders from below, presented only a smooth surface of burnished gold; but the sheets were

roughly laid, and fastened with large nails, which projected from the sides of the spire. He cut two pieces of cord and tied loops at each end of both, fastened the upper loops over two projecting nails, and stood with his feet in the tower; then clenching the fingers of one hand over the rough edges of the sheets of copper, raised himself till he could hitch one of the loops on a higher nail with the other hand; he did the same for the other loop, and so he raised one leg after the other, and at length ascended nail by nail, and stirrup by stirrup, till he clasped his arms around the spire, directly under the ball. Here it seemed impossible to go any further; for the ball was ten or twelve feet in circumference, with a small and glittering surface, and no projecting nails; and the angel was above the ball; as completely out of sight as if it were in the habitations of its prototypes. But the daring roofer was not disheartened. Raising himself in his stirrups, he encircled the spire with a cord, which he tied round his waist, and, so supported leaned gradually, until the soles of his feet were braced against the spire, and his body fixed almost horizontally in the air. In this position he threw a cord over the top of the ball, and threw it so coolly and skillfully that on the first attempt it fell down on the other side, just as he wanted it. Then he drew himself up to his original position, and by means of his cord, climbed up the smooth sides of the globe, and in a few moments, amid thunders of applause from the crowd below, which at that great hight sounded only like a faint murmur, he stood by the side of the angel. After attaching a cord to it, he descended, and the next day carried up with him a ladder of ropes, and effected the necessary repairs. ROVER.

BRIC-A-BRAC.

BY C. H. E. R.

DRESS with as much simplicity as possible, and endeavor to look as if your dress had been no trouble to put on. I have seen ladies exquisitely dressed, everything fitting, everything matching, no more ornamentation than was strictly allowable, every pin in its place, and yet the effect of the "tout ensemble" was marred by the extreme care that had been bestowed. The exceeding exactness, amounting almost to preciseness with which every bow was arranged, caused one to enter into a painful calculation of the labor bestowed. The effect was that of a correct architectural drawing in linear perspective, which one would have willingly exchanged for an artistic sketch.

Paradoxical as it may seem, a woman to be the perfection of fashion must be a little out of it. To be dressed in every minute particular according to the prevailing mode only places her on a level with other fashionably-dressed women; but let her use her own judgment, let her make some slight innovation, adopt some original idea that marvelously becomes her, and she becomes a fashion herself; her idea is copied, not always with success, for imitations are seldom successful.

WOMAN'S LOVE.—A French woman will love her husband if he is either witty or chivalrous; a German woman, if he is constant and faithful; a Dutch woman, if he does not disturb her ease and comfort too much; a Spanish woman, if he wreaks vengeance on those who incur her displeasure; an Italian woman, if he is dreamy and poetical; a Danish woman, if he thinks that her native country is the brightest and happiest on earth; a Russian woman, if he despises all Westerners as miserable barbarians; an American woman, if he has plenty of money; an English woman, if he is manly, affectionate, and true.

IDLENESS is the Dead Sea that swallows up all virtues, and the self-made sepulcher of a living man. The idle man is the devil's urchin, whose livery is rags, and whose diet and wages are famine and disease.

SPALPEEN.—The following explanation of this word occurs in a MS. written, if an opinion from the handwriting can be formed, between 1730 and 1740. It consists of notes taken in relation to Celtic antiquities and customs during a conversation between the writer and a "clergyman in Beaumaris, where I was once cast away in a storm." The reverend gentleman is throughout styled "Doctor," and his communications on Highland dress and games are curious: —

"The poor harvest-men who now pass in troops from Ireland to England are called Spalpeens, with a show of contempt or disrespect in using the word. Anciently the word Spalpeen meant a hero, a champion, or errant adventurer, and took its rise in the British Isles, from the number of younger sons of Irish kings, nobility and gentry, who passed in times of war to England and Scotland with volunteers to assist in defending those nations from the invasion of each other, but more especially of the Danes, when their own country was at rest. Many noblemen and gentlemen are now remaining in both kingdoms descended from these adventurers or Spalpeens. Spalpeena Diublishe is now used, as a synonymous phrase with a clever fellow of strength and activity.

IT may not be generally known that the manufacture of the Sevres porcelain is a government monopoly, and has been so since 1760. Its superintendence is confided to the most eminent scientific men of France, many of the ablest artists of the country being constantly employed in its decoration.

For Women.

CONDUCTED BY MISS FAITH RIPLEY.

A WEEK.

BY RENE BLUFF.

ANOTHER six days' work is done,
Another Sunday is begun;
Another week I've struggled through,
Against temptations old and new;
Nor always have the victor been,
When came some trial unforeseen.

This week, so sadly like the last,
Beyond recalling now is past:
And now that it has hurried by,
Another comes my strength to try;
Another week—there may not be
Another week of life for me!

O JESUS, cleanse this sinful heart;
Make me to love that better part
So well that, guided by thy hand,
Through all life's trials I may stand;
Safe then, while to thy cross I cling,
Whate'er the weeks or years may bring.

TRAINING GIRLS TO A PRACTICAL KNOWLEDGE OF SOME PROFESSION OR TRADE.

A. E. S.

THE Jews have this proverb: "Refuse to give your son a trade and you make him a thief." This is probably an ancient proverb, as the Jews are an ancient people and fond of adhering to ancient rites and sayings.

Now, what did the Jews do with their daughters, those fair descendants of Eve, whose desire to be not only an actor on the world's stage, but a prompter to action, has probably been transmitted to us all, whether for good or evil.

They did precisely what we are doing at the present day. They brought them up daintily, taught them a little spinning, and fine needlework, and as an accomplishment, to play on certain musical instruments as did Miriam, and then while yet the strains of the music rang in their ears, they were taught to sit down with folded hands and wait, each individual girl of them, the approach of the coming man, who should arise from the East or the North (or any other quarter of the globe) to marry her. When he came, she entered into a life-long contract with him to tend his house, rear his children, and be in all things faithful and true to him, her lord and master, for which she was to receive food and clothing, the latter she might spin—she had been taught how for that very purpose—while the former she could glean in the fields and grind into meal between two stones furnished her for the purpose.

Now, this in a modified form is just what is being done now-a-days. The education we give our daughter is designed to make her attractive,—not useful. If she fails to attract—and consequently to marry—we have come short of our endeavor, and find ourselves when jogging along the down-hill slope of life, with a *sour* old maid on our hands. Now, that she *is* sour is our fault, not hers. It isn't so much that she wanted to marry and couldn't, as that she did not succeed in doing the only thing she had studied to do. If she had been taught—as all girls, equally with boys should be—some useful trade or profession, and at the same time taught to look upon marriage as something not to be lightly esteemed should it come to her, nor pined for should it not, what a different aspect life might wear for her!

The wonder is, considering the way society is governed at present, that we have so many really contented and useful unmarried women as we do. The secret of it is, they have struck out from the beaten tracks far enough to find something for hands and brain to do. But it is not alone the girls, who from fate or choice, go through life unmated, to whom a thorough knowledge of some trade or profession would be a source of contentment and profit. There are thousands of wives with a mere nothing to do, who would be glad to labor, and to whom an opportunity to eke out the family income might be afforded, had they acquired the mastery of some special work or business. *A woman has no more God given right to depend upon her husband for a living, than he has to depend upon her for his.*

Society stamps woman as the weaker vessel, (and so at the present time she is in some respects), and makes man her provider; but society might bear a reconstruction in this respect, with advantage to both sexes.

Women would gain in self-reliance, not to mention self-respect, and gain in respect for her as his equal, had she the ability—to use a homely phrase—to "hoe her own row" in the world. If, *by nature* woman is the equal of man, if by *nature* she is fitted to occupy a position between a doll to be petted and played with, and a goddess to be adored, she must carve a way thither by her own device.

To stand beside a man as his acknowledged equal, it is not so much that she be equal with him physically or intellectually, as in her capacity to win the bread she eats. It is not enough that she is useful, or that by the service she renders she gives a fair equivalent for what she receives, but she must be able independently and with no resource but what lies in herself to make money. The money-makers are the law-makers and when men and women shall stand side by side in ability to provide for themselves and others, the ballot for women, so much coveted by many, and yet so far away, may be had for the asking.

It is not necessary that woman should do just such work as her brothers in every particular, but she should learn to do what she does well. Skill, not sex, should be the test to determine a person's fitness for position. Women, as a rule, have thus far been content with simply being able to perform what they undertook without caring whether they did it in the best manner or not. One reason for this seems to be the disposition so prevalent, to pay women less than men for the same work. They fail to see that in this half-way method of doing their work they but add to the odds against them in their competition with the *more skilled* labors of men.

Should the practice of training girls to the different trades and professions become general, we should soon have very few destitute widows eating the crusts of dependence. To lose one's husband would not be then, as it too often is at present, the very death-blow to all hopes of a comfortable living for wife and children. No woman

NO. 1 A CRAVAT OF GROS-GRAIN SILK AND LACE.

can afford to be the wife of a poor man, who has not something in the form of trade or profession, to fall back upon in case of need; and as the rich man of to-day may make the poor man of to-morrow, this assertion applies with equal truth to all women, no matter whatever their rank in life. But it may be urged by some in opposition, that the various trades and professions are already overcrowded. This may be true at the present time, especially in large cities; but if the men who hang in idleness about the streets of these cities, cared enough for work to seek it, in the rural towns and villages, they would not seek it long and earnestly without finding it; and even if they should venture *past* the towns and villages, and should take up for themselves a home among the "free homesteads" of the West, society would be none the loser, and they themselves certain gainers. For these idle, always-out-of-work mechanics never would have a home of their own unless it was given them.

Parents, give your daughters a chance to learn a trade; or, if their tastes and your means will admit of it, a profession. Have them set about it as soon as they leave the school-room. Give them *them the most thorough training* in whatever branch of labor is chosen, and teach them to remember this motto, then and always: "There is always room at the top."

A LITTLE TRIMMING.

ANNIE L. JACK.

I WENT down town, the other day, with a comfortable but old-fashioned hat on my head. It was one of those soft, gray felts that are always in style if properly trimmed; but the changes of fashion disturb me so slightly that whether the feathers and velvet were worn back, or front, or sidewise, seemed a matter of small importance. Not so with my companion, who surveyed it with a sparrow-like gaze, and politely suggested that I should cover as much as possible with my veil. On our return scissors were called into requisition, and a little time with needle and thread—a taking off here and putting on there, making here a bow and there a loop—transformed my dowdy hat into a neat and not to be criticised head gear. "Ah," said I, as I put it on, "there is a great deal done by 'a little trimming.'"

Many a time have I thought of this in the garden when, in autumn, the superfluous branches are cut from the gooseberry and currant bushes, leaving them shapely and tidy; when one would think the grape culturist was destroying his future crop, so closely does he prune the twisted vine; when over-grown rose bushes are deprived of dead, unsightly wood, and the clumps of perennials are divided to ornament other corners of the garden; when we cut down the suckers of plum and cherry, and lop and trim our apple trees till the ground looks like a network of branches, and the trees are straight and even,—I think to myself, as I notice the change, "What a difference, and all the work of a short time and 'a little trimming.'"

I went to a church "social" not long ago. It was in a country village where the people are not rich in this world's goods, and all work hard to gain an honest living. The subject under discussion was the building of a new church, and I thought how little the white-handed speakers—who in their hearts had no sympathy with manual labor—knew of the struggle for a comfortable livelihood through which many farmers have to pass, and how few in this climate attain until passed middle life, a free unmortgaged home. God bless the farmers! who toil and sow and reap that other people may eat; but reader, I long to see the day when those hard, sun-burned, toil-stained hands shall hold their own as a power in the land.

As I sat in the church thinking these visionary thoughts and listening to the comments upon its dilapidated appearance, my eyes wandered to that part where I knew the plaster had fallen off. But the deft handiwork of the young ladies had covered all defects. Mottoes of maple leaves gave words of welcome; pine and cedar were interspersed with the bright-tinted autumn flowers, and the defects were hidden by a bower of beauty. "Ah," said I, "there is something after all in a little trimming!"

And when I look around at farmers' homes, and see their hard-working wives and daughters, some of whose lives seem to me so unlovely, with such grand opportunities; when I *know* that the women of this generation are molding the men of the next century, and "as ye sow, ye shall reap," I feel inclined to utter a note of warning. "Better keep one cow less, and have less tucking to your skirts, if it robs you of time for intellectual improvement. The lessons learned weekly in the pages of the RURAL, go to teach us this need, in order that we may keep up to the times, be even with the men and women of our day who lead the van in progress and refinement."

The cheapness of good literature, of family papers and choice magazines, breaks down any barrier that may have been in the way, and yet I know families who take but two papers, a daily and a weekly, and own all the year round that "they find no time to read." The lack is not in time, but the way of spending it, and too many of the hard-working men and women even of this age ignore the fact of their mental needs, while ministering so bravely to the physical necessities. Culture and refinement are the necessary "trimming" to many a beautiful but homely life, that has in it much to be admired, but is wanting in these elements. And all that is required of the farmer is, so to elevate his profession in the eyes of other workers, that his strong, firm hands will be a mark of honor, to give his children advantages to fit them for any sphere, and add beauty of tree and shrub and household adornment to his home.

No man or woman is too busy or too old to study, and every winter to add to their knowledge by the pursuit of some branch of natural science, or political economy, or history. Books of all prices and to suit all tastes make these things easy for us, and tend to elevate our lives. These studies will teach us to revere and honor the Creator more while learning of His works, on this wonderful earth, and to know and admire the clever men who have written, for our benefit, while in our lives these lessons will be for all time "a little trimming."

NEEDLE BOOK.

This needle-book is made on a foundation of two pieces of cardboard, covered with blue silk or satin, and measuring three inches in diameter. The outer sides of the case are ornamented with embroidery, worked with blue and white purse

NO 2.—NEEDLE-CASE

silk, a narrow tatted edge, also worked with blue purse silk, is placed round the edge. Three leaves of white cashamere, plaited at the edges, are sewn inside, and the two covers are sewn together, and tied with blue satin ribbon. Those who cannot tat can substitute a simple crochet edge.

A SUGGESTION ABOUT OLD MAIDS.

IF they have all had their say about "Old Maids," I should like to put in a word. A common term of reproach to apply to a single woman, is to call her a "gossipping, meddling old maid." It is true too often, but is it not a case of talent misdirected which, if rightly employed, would make this same person useful and honored? A woman of ordinary turn of mind who has not married and has no especial business to which she is obliged to attend, is apt to fall into habits of news gathering and become disagreeable. It is quite as often true of married ladies who have small families and plenty of time on their hands, and who, if they had a dairy of ten cows, and as many children as JOHN ROGERS' wife, would make excellent members of society. Plenty of enforced occupation would cure these same meddling old maids of their disagreeable traits. Who doubts that ALICE CAREY, if she had married, would have made one of the noblest of women? It is not the mere fact of married or single life that determines character—it is natural disposition and the circumstances that surround us! S. C. D.

IN reply to a number of inquiries as to what was meant by the "flow" in article on "Opaline Painting," the author kindly sends us the following:

The "flow" is a kind of varnish—the same, I believe, as used by photographers for flowing their negatives.

The moving to and fro over the lamp is simply to dry it, and is accomplished by holding the glass between the thumb and fingers; the heat must not be enough to affect the hand unpleasantly. I find the better way is to pour on the "flow" so as to wholly cover the picture, and then pour it off before drying. In this way the process may be gone through with twice, if necessary, to insure the laying on of an *even* and *good* film of flow; but the first must be thoroughly dry before the second coating is put on. It is several months since I painted my first picture, which to-day is apparently as perfect as when finished.

Reading for the Young.

CHARLIE'S STORY.

I was sitting in the twilight,
With my Charlie on my knee—
(Little two-year-old, forever
Teasing, "Talk a 'tory, p'ease, to me,")
"*Now*," I said, "talk' *me* a' 'tory'."
"Well," reflectively, "I'll 'mence.
Mamma, I did see a kitty.
Great—big—kitty, on the fence."

Mamma smiles. Five little fingers
Cover up her laughing lips.
"Is oo laughing?" "Yes," I tell him.
But I kiss the finger-tips,
And I say, "Now tell another."
"Well"—all smiles—"now I will 'mence.
Mamma, I did see a doggie,
Great—big—doggie on the fence."

"Rather similar—your stories—
Aren't they, dear?" A sober look
Swept across the pretty forehead,
Then he sudden courage took.
"But I know a nice, new 'tory,
'Plendid, mamma! Hear me 'mence.
Mamma, I—did—see—a—*elfunt*,
Great—big—elfunt—on the fence!"

[*Springfield Republican.*

LETTERS FRON BOYS AND GIRLS.

A Nice Letter.

UNCLE AND COUSINS:—On this day of good cheer and celebration, with the air warm as in lovely September, and the pleasant balminess of Indian summer, I send you a letter fraught with much "peace and good will," for all our vast army of relations. I wonder how all the cousins are spending this lovely Christmas day? Won't some of you write and tell how it passed with you?

This week the County Institute meets in Washington, and the "pretty school-marm," and the "masters so cruel and grim," turn out in abundance. Those tread our streets, looking like so many cyclopedias, or Webster's Unabridgeds. I often wonder if vacation-time is a holiday to them.

WILD FERN need not look for me among them, for I'm neither "marm" nor "master" yet. And by-the-way, why don't that young lady give us her *real* name? Do you really want to know the name of him (her?) who is only a "flat" JUMPING-JACK?

Allow me here, kind RURAL editor, to return my sincere thanks for the package of seeds sent from the Experimental Grounds. I should have returned thanks, or made acknowledgement sooner, but was unavoidably delayed. The "best laid plans" are often made to go in a different way from that we intend, hence my delay.

I'm now going for a long walk over the beautiful hills and would like the company of W. F., or any agreeable cousins. Will you go along? But that cannot be I know, so I'll content myself with escorting two very nice little ladies out this afternoon. (Exit JUMPING-JACK.) Two hours later and we have returned. Our walk was grand. The sun was slowly sinking in all its traditional glory as we started, and we came home in the fast gathering twilight. This month of December has been a remarkable one with us, from the fact that the weather is so much like early fall. Not one sleigh-ride have we had as yet. But to tell something of our walk. We found clover and vines as green as in spring-time; oak leaves, a rich brown color, mosses green and tufty, nuts fresh and good, sassafras quite spicy, and many things to please the sight and taste.

As I sat on a moss-grown stump, and looked up at the vast network of branches at the tree-tops, at the beautiful grey of the bark, the haziness of the atmosphere, and the beauty all around me, there came to my mind the line: "There is a pleasure in the pathless woods," and I fully realized it at that moment: then the cloud pictures that we saw, seem like great bits of brightness, not easily or soon forgotten. And now, cousins mine, that another year is soon to commence let us not forsake this pleasant column of ours, but endeavor to make it brighter and better than ever before. And let us hope that kind UNCLE TRUE may issue a "Proclamation" again as liberal as the first one was. And with many good wishes for your prosperity, I *walk* this time quietly away. J. J.

December 25, 1877.

How We Prepared For It.

DEAR UNCLE TRUE:—Your beautiful present reached me last evening. I have not had time to read it yet, but am very grateful for it. When the bustle of getting ready for Christmas is all over, I am anticipating a delightful time in reading it. I wonder if you and the Cousins would like to hear me tell of my experience in getting ready for this blessed anniversary? If others enjoy it half as much as I have the doing it, I think you will all like to hear about it. We are going to have a Christmas tree, and we girls are to have the management of it. The boys get the tree and put it in the sitting-room, and then we are not going to let them see a single thing till it is all ready. We have fixed some lovely things with the pop-corn—festoons, crosses, anchors, and balls; they look very nice, so white and pure, in contrast with the dark-green, and they help to set off other things.

We have made lots of pretty things—not costly, but useful and pretty. Grandma has a nice Bible cover, to lay upon the top of her big Bible; and we have made handkerchief boxes of perforated card-board, wrought with worsted; glove boxes to match; letter cases, brackets, love-scales, and baskets made of cigar-lighters, little dolls made of cotton batting, pen-wipers, and so many things that it would try one's patience to enumerate them all. Grandmother says she thinks the CHRIST-child would be better pleased with our gifts if we could make presents to poor little children of things that they need to make them comfortable; but we had rather, by far, make pretty keepsakes for our dear friends. She knits mittens and stockings for all the little cold hands and feet in the village, and I do believe she enjoys knitting. I wonder if I shall love to knit as she does, when I got to be grandmother? It is very nice to see old ladies knit—they look so comfortable and happy—and I do think they enjoy it; but I cannot sit still long enough to make stockings grow. I like to read the letters from the Cousins, and I think UNCLE TRUE is one of the best Uncles in the world.—LILY LEE, *Randolph, Dec.* 22.

That Delightful Mad-Cap Mollie.

DEAR COUSINS one and all, here I am again. Perhaps I am impertinent in coming again so soon, and if so I am very, very sorry! Am I forgiven the offense? Yes, I see I am by the smile on all your faces, the outstretched hands, and oft repeated word, welcome! How kind of you to greet every one then, and to make them feel so welcome. Is it not splendid that we can meet and talk together in this way, but would it not be far better for all to meet in Uncle True's study, and talk face to face. But a wee, small voice whispers: O Mollie, Mollie, how you are rambling from the topic you came to talk on,, so back to the right path you truant. Hush, hush Solomon Sap, none of your grumbling, for I have the floor, and will be heard. I wonder if there is a beam in my own eye, for if there is not I would like to pull the mote from yours, and let you see that we are really a jolly lot of cousins, and in whose society one might find much pleasure if they were not constantly looking for faults. But sir, your egotism is fearful and I challenge you to drop the mask and reveal the gentlemanly side of your character, (for I know you have one,) and I for one will come over to the enemy's side, give you my hand as a flag of truce, and say I'm your cousin and friend, will you accept me as such? I would say to all these girls who are brave enough to join me in that pledge, that I am glad and proud to call you cousins, and would like to know you personally, and to you, dear Snowflake, if you or anyone else think you can find anything interesting in my nonsensical epistles, I shall be delighted to receive and answer any number of letters addressed to MADCAP MOLLIE.

Wanted a Sister for Adoption.

DEAR RURAL: I am quite a small boy. I like to read the letters. I had a real good laugh on the verse about the treeses and the cowses. I guess the boy that wrote it laughed too. I live on a beautiful hill near the Blue Ridge Mountains. My papa has a nice little horse, and I like to ride horse-back, but strange to say, as soon as I mount his back, and tell him to go forward, he will turn to go to the barn again. Can any of my Rural cousins tell me what to do? He minds all but me. I have a nice kitty too, and four years ago I had a nice sister. She is an angel now, I miss her very much. My mamma says she would like to adopt a nice little girl about ten years old to fill my sister's place. She must be smart and know something of music, and I say pretty too, for I want her to go to school with me. If any one who reads this knows of such a little girl, won't they please to let us know where to find her.

This is the first letter I have writen to the RURAL. If I see this in print it will make me want to write another one, better I hope. From your little friend, ARCHIE M. MORRIS.

Westfield, N. J.

The First Snow.

DEAR RURAL AND COUSINS ALL:—I see now, as I sit before my western window, the gentle snowflakes coming slowly to the ground, to remind us that we are once more enfolded in winter's cold embrace; and now for the skates which I aways love to use whether it is the fashion or not. SLAYEROFCONCEIT has once more made his appearance on the field of action, after having so successfully tried to expel YOUNG EDITOR NO. 1, and others from our ranks. SNOWFLAKE'S way of spending the long evenings is very well for a time, but all study is tiresome. I was somewhat surprised to hear WILD FERN say that she first thought me a boy.

I had the pleasure of visiting the great summer resort, Lake Mohonk, this autumn. It was a lovely day, and a more pleasant place I never saw in the mountains, and oh! how I love to sail on the lake's deep waters,

As it ripples and brinkles, and dimples and twinkles,
Beneath the bright lances the sunset has thrown.

It is needless to add that a small party of four enjoyed themselves climbing over the rocks and searching through the caves. I will now close by wishing you all a Happy New Year. Adieu.

IVYREST, N. Y. IVY.

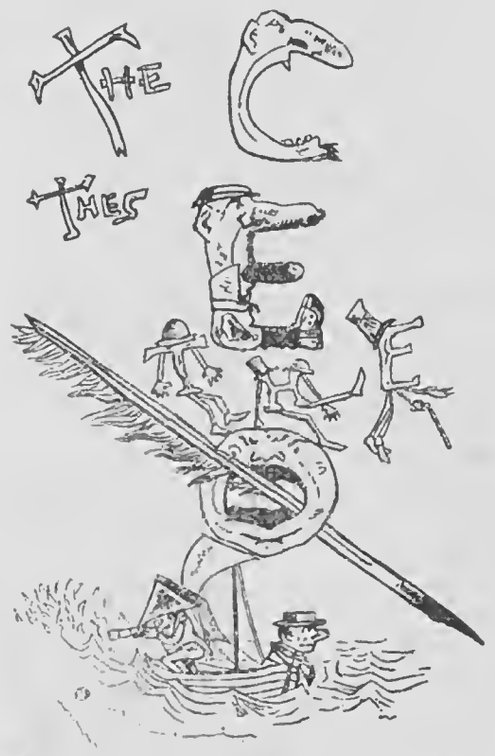
A New Arrival.

DEAR COUSINS—one and all—how are you? I've arrived here at last, (if UNCLE TRUE will let me stay,) and I am very glad to see you. I have been a long time on the way, but you know "it is better late than never." I have often been tempted to write and take arms against—not a "sea of troubles," but SOLOMON SAP, SLAYEROFCONCEIT, etc. They probably never would have recovered from the attack, and they may thank their stars that I pass them by on the other side this time.

I agree with SNOWFLAKE, in regard to being sociable. SLAYEROFCONCEIT had better be careful in giving others too good a "chance to shoot," as he may retire from the field wounded in spirit as well as conceit. I am one of the girls that like to skate, though I do not lay claims to being an expert. Now, Cousins, do be lenient, and not judge me by this first letter. I may not know anything, but please give me a fair trial. Tremblingly I await your verdict.—N. N., *Buffalo, N. Y.*

The Puzzler.

ILLUSTRATED REBUS.



☞ Answer in two weeks. H. W.

MISCELLANEOUS ENIGMA.

I AM composed of 9 letters.
My 9, 5, 6, 6, 8 4 a woman's name.
My 5, 3, 2 an animal.
My 4, 8, 3, 3, 6 to occur.
My 9, 7, 3 part of the body.
My 4, 5, 1, 2 a condition of the air.
My 9, 2, 5, 3 a pile.
My 4, 7, 2 to hasten.
My 7, 6, 8, 6, 2 empty.
My 3, 7, 6, 2 a kind of tree.
My whole is a man's name.

☞ Answer in two weeks. S. C.

WORD-SQUARE ENIGMA.

1. A VERB; spelled another way, it is a part of anything.
2. The name of one of the first men mentioned in the Bible.
3. The name of a certain meat.
4. The name of a girl.

☞ Answer in two weeks. ONONDAGA.

PYRAMID PUZZLE.

1. A CONSONANT. 2. A pronoun. 3. A color. 4. A Grecian gulf. 5. A Swiss lake. Centrals form a grain.

☞ Answer in two weeks. MD.

"POST HOC EXILIUM."

AFTER this exile; not while groping here
In this low valley full of mists and chills,
Waiting and watching till the day breaks clear
Over the brow of the eternal hills—
Mother, sweet dawn of that unsetting sun,
Show us thy Jesus when the night is done!

After this exile; when our toils are o'er,
And we, poor laborers, homeward turn our feet;
When we shall ache and work and weep no more,
But know the rest the weary find so sweet:
Mother of pity, merciful and blest,
Show us thy Jesus in the "Land of Rest."

After this exile; winter will be past,
And the rain over, and the flowers appear,
And we shall see in God's own light at last
All we have sought for in the darkness here;
Then, Mother, turn on us thy loving eyes,
And show us Jesus—our eternal prize!

A GODLY ENTERPRISE.*

R. E. W.

THERE have been some redoubtable scientific scoffers of the efficacy of prayer, notably TYNDALL and HUXLEY, but precisely in their own country is established an enterprise that ought, surely, to confound them. About fifty years ago GEORGE MULLER was a theological student at Halle, Germany, and was as regardless of true religion as the twelve hundred and sixty other young men there gathered together. But, at last, it pleased GOD to alter his life, and he found the LORD. Soon, thereafter, he went to England as a missionary to the Jews, but after laboring for months among this people, relinquished the task, and turned his attention to the Gentiles. This act severed his connection with the society under whose patronage he was working, and he was left in a strange land without friends or resources. Now, the question was what to do? He thought—"If I only seek to labor for the Lord, if I act only as becomes a servant of Jesus Christ, my gracious Master will surely care about my temporal necessities." "If ye shall ask anything in my name, I will do it." And relying implicitly on this promise he took no thought of the morrow, simply praying to the Lord to relieve his wants. From that time to the present those prayers have been answered, and in the most extraordinary manner. At no time has Mr. MULLER had any salary or emolument for his labor. Occasionally all the provisions in the house were exhausted, in addition to the money having melted away.

Finally his attention was directed to the homeless children roaming the streets, and after earnest thought and prayer he judged God would bless his efforts in their behalf, and on March 5th, 1834, was commenced the work that has since grown to such glorious proportions. The beginning was exceedingly small. The income of the first year amounted to only $620.

In the circular recommending the enterprise to the Community it was distinctly stated that the living God, Himself, was the patron of the institution, and to Him alone should the founder look for aid and comfort. Thus was begun one day-school, one Sunday-school and one adult school, but before a twelvemonth had passed the day-schools had increased to six. In the second year the work was enlarged: a significant incident led him to enter on this last venture. Visiting poor members of the church one day, he was pained to see their extreme necessities, and thinking over it he exclaimed, "Oh! that it might please God to give me more means for myself that I might give more," and scarcely had the words been uttered when the mail brought $300. After having prayed for helpers, suitable premiums and $5,000 to begin the orphan work he rested calm and content, feeling sure his prayer would be answered. The next day came twenty-five cents, then came a piece of furniture. Two days after $500 was received from a poor working girl. Mr. MULLER tried to dissuade her from giving this half of a legacy to which she had just fallen heir, as she was in bad health, and could earn but $1 per day. She insisted, saying that she had well weighed the matter, and rather than the orphan work should not come to pass she would yield up every penny she possessed. Further donations coming in, he was in a position to hire a house.

Everything was now ready—all but the orphans. Mr. MULLER appointed a time when he would be in the vestry to receive applicants. The time came, but no orphans came with it. After two hours he said to himself, "I have prayed for everything but I have never asked God to send me orphans." He had taken for granted that orphans were about the most plentiful product of the British Isles, and articles that would surely come without praying for them. The next morning, after a night of serious prayer the first orphan was applied for, and during the month forty-two were added to the first arrival.

The institution grew apace, another house was rented and yet another, and another until it became advisable to build for himself. After earnest communion with God, Mr. MULLER felt called upon to build a house suitable for 300 orphans and assistants. This would cost $76,000. He had just $7. He prayed for 33 days without visible result, on the 24th came a check for $5,000, and by degrees the entire sum filtered in.

An anecdote concerning the purchase of the land happily illustrates what Mr. MULLER wishes to enforce. He had called twice to see the landowner, alternating between his house and counting-room. We give Mr. MULLER'S words, "Now," I said to myself, "shall I go again to the house of this merchant, or shall I wait until to-morrow?" It appeared to me "Here is the finger of God"; for I was told I should surely find him at 7 P. M. at home; then I am told I should surely find him at the counting-house; I go there and he has just left. The hand of God is in this, and the best for me is to wait until to-morrow." He did so and next morning the owner said, "I have heard, sir, about you. You wish to buy land for an orphan home. During the past night I lay awake, I could not sleep. I said to myself, if this gentleman comes for the land you must sell it to him for $600, instead of $1,000 an acre." And so the work progressed. Five orphan-houses were built at different times, accommodating 5,250 orphans, besides 114 schools were founded, instructing 10,000 pupils.

Not one cent of the great amount of money required to build and conduct these institutions was solicited. When money was required earnest prayer seemed to bring it. It was frequently the case that there was not money enough in the exchequer after breakfast to pay for the succeeding dinner. Yet never was a meal delayed, and never was a cent borrowed. If any more convincing proof is needed of the efficacy of prayer, there must be skeptics indeed!

NEWS OF THE WEEK.

CONDENSED NEW YORK TELEGRAMS.

TUESDAY, Dec. 25.—Trouble is apprehended from the Bannock Indians in Idaho. The Cuban insurgents are surrendering in considerable numbers. Spain has now in the island three times the number of troops Uncle Sam possesses altogether.

If the weather permits, the Russians will at once attack Rustchuk and Silistria and also push on to the Balkans. An assault of the Servians upon Yatre was repulsed with immense loss. England has already equipments in store for at least two army corps, and is ready, if needed, to take part in the fray. All the republican municipal officials, removed during the late contest in France, have been restored to their positions.

WEDNESDAY, Dec. 26.—Senator Patterson, of South Carolina, has had a relapse and is still in a precarious condition. From all parts of the country come reports of murders and outrages resulting from too much alcoholic Christmas.

Plevna at its surrender was a vast charnel house, dead and wounded heaped and festering together, around the city the bleaching bones of those who had fallen in the numerous conflicts, pestilence and starvation on every side. The Servians, after eight hours fighting, captured Ak-Palanka, on Monday, together with three Krupp guns and a great amount of amunition and provisions. The Russian lines are closing fast round Erzeroum. France will not move from her neutral attitude.

THURSDAY, Dec. 27.—A party of the sixth cavalry pursued a number of Indian raiders into Mexico, killed upwards of sixteen, captured their plunder and ponies and destroyed their camp. The great sensation among politicians is a letter from W. E. Chandler, the New Hampshire member of the National Republican Committee, explicitely charging that Hayes' "Southern policy" is the result of a bargain made with Southern Democratic Congressmen during the electoral count. They were to refrain from opposition to his election in return for his concession to their demands.

Turkish prisoners from Plevna are perishing in large numbers from the intense cold. Thirty thousand Servians, with 120 guns, have invested Nisch and captured Leskovatz with a large quantity of cattle and provisions. The back-bone of the war party in Constantinople is growing stiffer.

FRIDAY, Dec. 28.—There are strong indications that the Republican Senators will be outspoken in their opposition to the President and his policy when Congress re-assembles.

Austria has protested against any Servian action in Bosnia and Herzegovina, and Servia has ordered her military authorities to refrain from hostilities in those provinces. Owing to the snow blockade there is much difficulty to supply provisions to the Russian troops in Bulgaria, especially at Plevna. A Turkish transport with 700 troops has been captured by a Russian war-vessel in the Bosphorus.

SATURDAY, Dec. 29.—Defaulter Owen Murphy is safe in Canada. It is probable that he appropriated $150,000, instead of $50,000, as supposed at first. The extradition treaty does not cover breaches of trust or embezzlement, so that the rascal is safe.

Russian reinforcements just ordered, amount to 250,000 men. An army of the Baltic, 80,000 strong, is being organized. The Czar says:—"England will apparently exercise pressure upon the liberty of our action; but we will not consent to mediation, and are armed against intervention." Russia has ordered 1,200 Krupp field guns. England is preparing for emergencies. Severe snows and cold have suspended operations in Bulgaria. Osman Pasha has arrived at Bucharest.

SUNDAY, Dec. 30.—A judgment for nearly $400,000 for canal frauds has been gained by this State against Dennison and Belden of Syracuse, contractors. The report of Adjutant-General Latta of Pennsylvania, declares that the rioters at Pittsburg were encouraged by public sentiment and the press.

Turkey has appealed to Great Britain to act as mediator in negotiating for peace on the basis of the present condition of facts. Russia claims, and Germany backs her up in it, that mediation unless solicited by both belligerents amounts to intervention, and will be disregarded by her. The Servians have captured Pirot, 35 miles southeast of Nisch, with 20 cannon, 1,000 rifles and 50 prisoners. In London there has been a fierce faction fight between a party of working-men favoring Turkey and another friendly to Russia; the latter were greatly outnumbered and disastrously routed—a straw!

MONDAY, Dec. 31.—At Lynn, Mass., where shoemaking is extensively carried on, the Crispins are on a strike, and maltreating those who venture to take their places. Serious trouble is apprehended.

There is slim prospect of British mediation being accepted by Russia, which insists that Turkey shall treat with her directly. The Russian press scouts the notion that England, while neutral, will be permitted to occupy any Turkish towns as a precautionary measure. A war fever is spreading rapidly through Great Britain. The Russians are approaching Sofia. All the bridges over the Danube have been swept away by the ice, and passage by boat is slow and very perilous. Moukhtar Pasha has left Erzeroum with a small force to act against the Russians in the field. Snow, however, has suspended operations on both sides.

Ex-President Martin Van Buren was made comfortable by the use of Jonas Whitcomb's Asthma Remedy.

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Dec. 29, 1877.

THE wholesale markets this week can be dismissed with brief allusion. Holiday week, beyond a few specialties, is always dull, and its observance is becoming almost as marked as it is in Europe. The coming month of January will find the market with a surplus of certain kinds of produce that should have moved freely during autumn and December. Dealers, however, have some hope that the new year may galvanize trade, though much will depend upon more seasonable weather than we have had during the past remarkable season.

BEANS AND PEAS.—Receipts of beans past week, 8,432 bush. Exports, 557 bbls.; since Jan. 1st, 41,979 bbls. The market is quiet for medium beans, with prices well favoring buyers. Marrows not so active, and prices for best marks are shaded. Pea beans nominal. White kidney lower. Red firm for choice. There is little new trade in peas of any kind. Prices only steady.

We quote:—Beans, medium choice, $1.87@1.90; other, $1.80@1.80; marrows, choice, $2.25@2.27; other, $2.00@2.20; pea, $1.75@2.00. White kidney, choice, $2.00@2.25; other, $2.10@2.26; red, choice, $2.60; extra, $2.50; other, $2.25@2.35. Turtle soup beans, $1.85. Lima, $3.00. Green peas, $1.35@1. $1.35. Southern Black-Eye peas, per 2-bush. bag, $3.25. Canadian field peas in bulk and bond, 86c. for prime.

BEESWAX.—Export demand continues, and prices are strong. Sales at 27½@28½c. for Western and Southern.

BROOM CORN.—Offerings are large, and demand is good.

Green brush at 6@7c.; green hurl, 6@7c.; medium green, 5@6½c.; red-tipped, 4@5c., and common red, 3@3½c.

BUTTER.—Receipts for the week, 15,624 pkgs. The demand is quite equal to this particular time. Western fancy sells higher than State creamery. The recent Western Dairymens' Convention in Chicago showed that Western creameries are to have the future rule of the trade in extra cold weather fresh. The strong prices now current for finest State will certainly help some of the hitherto neglected lines. A very large class of New York consumers cannot afford to pay a profit upon 30@35c. bought butter. Fine Western factory and dairy butter is scarce. We are accustomed to more regular receipts at this season; prolonged pasturage has kept down quality. Exporters are doing comparatively nothing and a large stored surplus is still dragging on the market. Rolls have a wider range, some run poor in the warm transportation.

The best premiums were awarded as follows: First, $100, B. E. Wood Huntley, Ill.; second, $75, A. J. Booth, Salem, Wis.; third, $50, R. S. Houston, Pleasant Prairie, Wis.

We quote State fancy pails 28@30c.; other, 25@30c.; creamery, good to choice, 25@33c.; half tubs, selected, 27@28c.; extra, 25@32c.; other, 21@25c.; Fall Welsh 26@28c.; Welsh tubs, prime, 26@28c.; other, 18@22c.; full dairies, fine, 25@26c.; common, 17@18c.; firkins 23@24c.; poor State, 13@16c.; Western creamery, good to choice, 34@35c.; poor to good 25@30c.; dairy tubs, best, 18@20c.; good, 18@20c.; other, 10@13c.; factory tubs, good to best, 19@21c.; common, 13@15c.; Western firkins, good to best, 10@12c.; other, 9@13c.; rolls, 12@19c.; grease, 6½@7c.

CHEESE.—Shipments for the week have been only 19,300 boxes. This light movement is incident to the holiday week. There is a fair home trade demand. Fancy stock is held firmly.

At the Dairymens' County Convention in Chicago, Herkimer County obtained the first prize. The following were the best awards:—First, $100, Whitman & Burrel, Little Falls, N. Y.; second, $75, J. Coles, Venango, Pa.; third, $50, Towle & Roper, Chicago, Ill.

Fancy factories, 12½@13c.; good and prime, 12@12½c.; fair lots, 11½@11¾c.; poor, 8@10c.; 7@10c. skimmed. Farm dairy, 11½@12½c. for good to prime; 10@10½c. for fair lots; 7@10c. for skimmed; Western factory, cheddar, 12½@12¾c. for fine 10@11½c. for good; 5@8c. for fair.

Exports past week, 19,825 boxes.

Liverpool cable, 63s. 6d. Gold closes 102¾.

COTTON.—There has been a more active export trade, and a generally stronger market.

Latest prices are for January, 11.25@11.26c.; February, 11.25@11.26c.; March, 11.48@11.49c.; April, 11.61@11.62c.; May, 11.73@11.74c.; June, 11.84@11.85c.; July, 11.91.; August, 11.96@11.97c.

DRIED FRUITS.—Trade is very slow, unpeeled peaches are lower, and hard to sell, apples and other fruits are held as before.

Apples—Old State quarters, 5¾@6¼c.; new, 6¾@6¾c.; Western quarters, old, 5½@6c.; new, 6@6½c.; Southern, new, prime sliced, 6¾@7c.; fair to good, 5c. Peaches—Peeled, new, 11@12c.; unpeeled halves, 4¾@5c.; unpeeled quarters, 4@4½c. Pitted cherries, 15½c. Blackberries, 9@10c. Raspberries, 28c. Plums, 10@16c.

EGGS.—Receipts for the week, 4,500 barrels. The market is weak and lower. The demand is still greatly under the style of winter wants and regular receipts and lots seeking a market from other cities easily cause an overstock. Prime fresh have the most sale, buyers are shy of stored lots. Limed eggs have an undecided position, the weather would have warranted their pickling another month. There is a moderate sale for export.

Near points, 26@27c.; State and Pennsylvania, 23@25c.; Canadian 22@24c.; Western, best, 24c.; other, 21@23c.; Southern, 21@24c.; Limed, State, 17½@18½c.; Canada, 17@18c.; Western, 16@18c.

FEATHERS.—Live white prime Western geese, 45@47c.; mixed, 30@40c.

FEED.—Sales of 40 pounds ave. $18.00@19.00; 60 pounds ave. $18@18.50; 80 pounds ave., $18@19; 100 lbs., $20@21.

FLOUR.—The week's business has been small, but this is largely due to the period, the interruption by the holidays. Receipts have been large, but prices generally steady.

Latest prices are $4.75@5.25 for poor to fancy superfine State; $5.35@5.60 for common to fair extra do.; $5.65@6.00 for good to choice do.; $4.75@5.25 for superfine Michigan, Indiana, Iowa, &c., outside for choice; $5.35@5.60 for shipping extra do., the inside price for poor, and $5.60@6.00 for good to strictly fancy extra do.; common to choice white wheat extras, $5.85@7.25; fancy do. at $7.25@8.25; red and amber winter wheat, good to choice family, at $5.65@7.25; round hoop Ohio at $5.40@5.75, and trade brands of do. at $5.80@7.00, the latter for choice; St. Louis, $5.60@6.35 for poor to fair extra and $6.35@7.50 for good to fancy, (with a few brands of very fancy quality quoted up to $8.25@8,50); Minnesota clear, $5.50@6.75; Minnesota "straight," common to fancy, at $6.25@7.75, and patent poor to very choice, $7.00@9.25, with a few fancy at $9.50@10; unsound stock at $5.00@6.50; city mill extra at $6.25@6.50 for fair to very choice for West Indies; do. for England $5.50@5.80; do. trade and family extras, $6.75@7.75; do. South America, $6.60@7.50; No. 2 at $3.00@4.25.

Buckwheat flour, $2.40 for common; fancy, $2.75.

Corn Meal is selling at $2.60@3.00 for yellow Western, and $3.25 for Brandywine.

FRESH FRUITS.—Exports apples past week, 2,450 bbls. There has been a fair business in apples, and many stored lots are present for sale, as the warm weather is telling upon them, or owners fear bad results.

We quote Baldwins, $3.50@3.75; Spitzenbergs, $4 00@4.50; Russets and Greenings, $3.25@3.75; prime sweet, $3.25@3.50; Seek-no-further, $3.75; Newtown pippins for export, $7@8; Lady apples, $8@15. Fine grapes scarce and higher—Catawba, 5¼@6½c.; soft berries, 2@4c.; Isabella 2@4c. Florida oranges firm, the demand is not sharp but the stock has run down. Cranberries in fair demand for local use. Peanuts higher—fancy, $1.60; other, $1.45@1.50. Hickory nuts low—75c.@$1 bush. Texas pecans, 8@9c.

FURS AND SKINS.—Market quiet and nominal here. Receipts small—few sorts wanted. Southern quoted 20 ₱ cent. below Western.

	No. 1 quality. Nor. & East.	West & N. W.
Otter, ₱ piece	$3 00@4 00	$2 00@2 50
Gray Fox	40@45	40@45
Red Fox	75@80	60@65
Black Bear	5 00@6 00	4 00@5 00
Brown cubs and ylgs.	1 00@2 00	1 00@2 00
Florida deer skins	15@18	
Fisher	5 00@6 00	4 00@5 00
Mink, dark	85@90	50@60
pale	50@60	30@40
Muskrat, winter	8@10	6@8
fall	6@7	4@5
Kitts	@2	@2
Beaver, ₱ lb	1 00@1 25	60@75
Raccoon	35@45	35@45
Opossum	3@6	3@6
Skunk, black		40@45
striped		5@20
Wolf, mountain		1 50@2 00
prairie		50@60

GRAIN.—Wheat stronger, and 2@3c. higher and moderately active.

Latest sales are of No. 2 red at $1 48@— ungraded red and amber State, $1 53@1 55; white, $1 56; No. 1 Northwest spring, $1 37; No. 2 Chicago, $1 32½; No. 2 red for January at $1 33; No. 2 Milwaukee spring, $1 38. Rye is a trifle steadier; sales of Western at 74@75c.; State at 76@77c. Barley, 55c for No. 1 Canada; 75@79c. for two-rowed State. Corn is a trifle lower and active. Latest sales are of New York No. 2 at 64@64½c.; steamer mixed, February, 59c. Oats of New York extra white, at 42½c.; do. No. 1, January, 40c.; No. 2 white, 39½@39¾c.; mixed Western, 38@38½c.; white Western, 38@40c.

HAY AND STRAW.—There is a fair business in prime stock, and shipping trade is moderate.

Bale hay, 60c. for shipping, and 75@85c. for retail qualities; clover, 40@50c. for prime. Straw, 50@55c. for long rye; 40@45c. for short rye, and 40@45c. for oat.

Exports past week, 1,700 bales.

HONEY.—Sales light for the season. Choice white clover comb, 19@20c.; good, 13@16c.; dark, dull and lower; buckwheat, 10@15c.

HOPS.—Exports for the week have been 2,500 bales. This fair movement, together with a good trade for the season from brewers, exerts firm prices.

State choice to fancy, 11@13c.; do., low and fair, 5@7c.; Eastern, new, 8@12c.; Wisconsin, do. 5@8c.; Yearlings, 3@5c.; Olds, all growths, 2@3c.; Californians, 12@14c.

OIL-CAKE.—Western is offered at $33 ₱ ton.

POULTRY AND GAME.—Live poultry has sold fairly, while dressed turn out poorly. Prices, however, have kept low.

N. J. chickens, 8@10c.; fowls, 10@12c.; Turkeys, N. J., 10@12c.; Ducks, N. J., pair, 65@90c.; Geese, N. J., $1.50@1.75; Western, $1.12@1.37.

Dressed poultry is doing better, but before the present prices were reached, a great many losses had to be submitted to. Now that the old stock is gone, there is a better opening for fresh-killed. The season, however, must be looked upon as a lost one, and the weather must harden before anything like compensatory prices can be quoted regularly. Canada has been sending some shipments of turkeys, fowls, and geese to England.

Fancy Phila. and N. J. turkeys, 15@17c.; good, 13@14c.; common, 9@10c.; chickens, choice, 15c.; good, 12@13c.; common, 7@10c.; ducks, choice, 14@15c.; other, 12@13c.; geese, fancy, 13c.; other, 7@11c.

Game items are lessening in variety. Prime quail bring good prices. Grouse are easy. Venison is cheap; few care to handle it at 8@10c. for saddles and 3@6c. for while deer.

Hares, pair, 25@35c. Black bear, 25c. carcass. Canvas-back ducks, $2.50@3; Red-heads, 75c.@$1.25; Mallard, 65@75c.; Teal, 40@50c.; common, 25@35c. Quail, 75@80. Partridges, pair, 45@55c.; soft, 15@25c. Grouse, 75@80c. soft, 30@50c. Woodcock, 40@50c. Rabbits, 25c.

PROVISIONS.—Hog products have been depressed and lower. Mess pork $12.6½@12.81½ for spot lots $12.80 for January, $12 85 for February and $12.85 for March. Bacon at 6½@—c. for long clear and 6¾c. for short clear. Lard—Western steam at 8-10c. for spot, 8-10c. for December, 8.10½ for January, and 8.25c. for February and 8.40c. for March. Tallow, 7¼c. for prime. Stearine, 8.02½c. for prime. Beef hams at $16.50. Beef—New extra mess, $13@13.50; new plain, $11@12.50.

SEED.—Grass are lower: clover 8@8¾c. for prime, timothy, $1.37½@1.40.

TOBACCO.—There is a good export and fair home trade demand and prices strong.

VEGETABLES.—Exports of potatoes past week, 3,397 bbls.; of onions, 100 do. A good many potatoes are turning out poorly. Eastern stock brings best prices. We quote Peach Blows, $1.75@2, bulk and double-heads. Early Rose, $1.75@1.87; Peerless, $1.25@1.50; Nova Scotia, $1.50@1.75; Sweet, $1.50@2.50. Onions are falling off in quality and the market is lower even for best cabbages selling at $1@3 per 100 in winter is a novel range.

Cabbages, 100, $1.00@3.00; red, 3@4. Marrow squash, bbl., 75@87c.; Hubbard do., 87c.@$1.12. Cauliflower, $2.00@3.50 ₱ bbl. Russia turnips, 75@75c. Carrots, 75@75c. Beets, bbl., 62@87c. Red and yellow onions, $1.00@1.25; white, $1.25@1.75. Pumpkins, ₱ 100, $4@7; extra, $6@8. Celery, doz., 75c.@$1.

LIVE STOCK MARKETS

NEW YORK, Dec. 31, 1877.

BEEVES.—Receipts for the week, 6,141 head; do last week, 8,745 do. There has been quite a buoyant feeling in prices during the week, and salesmen have been encouraged by cleared yards almost every day. The advance is about ½c. ₱ ₱. on good medium cattle. A few more lots of fat cattle have arrived, but, as we have before remarked, premium stock has lost its old-time prestige. Retailers now almost exclusively depend upon Washington Market and other wholesale slaughterers. The principal exporters are drawing a good share of the best stock for European use. The range of the late market was as follows: Fair to good steers, 8@9c.; prime to choice, 10@11c.; sales rating in best proportion in the upper prices. A car of bulls sold at 3½c., live. Weather to-day decidedly in favor of trade in live stock.

COWS AND CALVES.—Supply small and demand not calling for much stock. The nominal quotations are at $40@70, with an occasional extra at $80.

VEAL CALVES.—The market closed strong on Saturday, and the cold weather to-day clinches prices. Choice N. J., 8½@9c., live; do. State, 8@8½; other grades, 7@7½c. Hog-dressed calves scarce and higher, selling this P. M. at 11½@12½c.

SHEEP AND LAMBS.—Receipts for the week, 10,932 head; last week, 24,230 do. Supplies have been unusually light, but the market has not noted fancy prices; still the market is firm. Sheep ranged at 4¾@5¾c.; lambs, 6½@7c., the latter for choice Canadian.

SWINE.—Receipts for the week, 29,203 head; do. last week, 31,470. Supplies have been ample for holiday week, and a warm one at that. The latest sale was a car-load of Ohio, 172 lbs. average, at $4.70 per 100. Very little country-dressed in to-day, and the market is firmer. Light pigs, 6¼@7c.; medium to heavy, 5¾@6¼c.

OTHER LIVE STOCK MARKETS.

BUFFALO, Dec. 28.—CATTLE—Receipts, 833 head; for the week thus far, 5,389 head, against 8,619 last week, a decrease of 190 cars; consigned through, 198. No sales to-day; fresh arrivals consigned through 14 cars of through stock in the yards held for shipment to-morrow.

SHEEP AND LAMBS.—Receipts, 1,300 head; for the week thus far, 6,900 head. Market quiet and a shade weaker. Western sheep, $4@4.40.

HOGS—Receipts, 4,200; consigned through, 45 cars. Yorkers, at $4,15; good to best, $4.25@4.45.

CHICAGO, Dec. 28.—[The Drover's Journal reports]: CATTLE—Receipts, 3,900 head; shipments, 2,900. Native Butchers slow; Bulls, $1.50@2.75; cows, $2@2.90; Texans, $2.40@2.75 ₱ 100 lbs. Colorado steers, $3@3.25.

HOGS—Receipts, 29,000 head; shipments, 940; all grades lower. Shipping, $4.15@4.25; mixed packing, $3.90@4.05; light, $4.05@4.10.

SHEEP.—Receipts, 3,705 head, shipments, 1,200 do.;

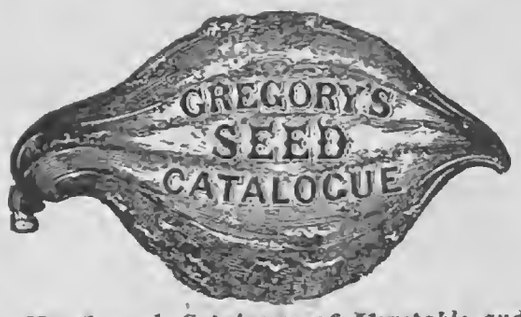
SEEDS

Flower, Field and Garden. Fresh quality. Catalogues mailed free on application.
AUGUST ROLKER & SONS,
44 Dey St., New York.

HEREFORD CATTLE.
For sale by private treaty: Yearling Bulls of the fashionable "Cronkhill" and other well-known tribes, possessing great scale and heavy flesh, with abundance of good hair and grand character. In healthy, growing condition, and not pampered for show. Also, a few choice Cows and Heifers. For full particulars, apply to the breeder, JOHN HILL, Felhampton Court, Church Stretton, England.



My Annual Catalogue of Vegetable and Flower Seed for 1878 will be sent FREE, in January, to all who apply. Customers of last season need not write for it. I offer one of the largest collections of vegetable seed ever sent out by any seed house in America, a large portion of which were grown on my six seed farms. *Printed directions for cultivation on each package.* All seed sold from my establishment warranted to be both fresh and true to name; so far, that should it prove otherwise I will refill the order gratis. As the original introducer of the Hubbard and Marblehead Squashes, the Marblehead Cabbages, and a score of other new vegetables, I invite the patronage of *all who are anxious to have their seed directly from the grower, fresh, true, and of the very best strain.*
New Vegetables a Specialty.
JAMES J. H. GREGORY, Marblehead, Mass.

BUTTER. OUR PERFECTED BUTTER COLOR is far better than carrots, annatto or any other color, at one-fourth the cost, and no work to use. It gives a pure dandelion color and never turns red or rancid, but tends to improve and preserve the butter. Warranted to add 5 cents per pound to its selling value. Thousands of testimonials from the very best dairymen. Descriptive Circulars telling where and how to get it, free. Sold by druggists.
WELLS, RICHARDSON & CO., Burlington, Vt.

DON'T BE A FOOL,

but send for Free Price List, and know why we sell a Five-Ton Wagon Scale at $50. All iron and steel; brass beam. Delivered freight paid, and no pay till tested.

JONES OF BINGHAMTON,
BINGHAMTON, N. Y.

WEAK LUNGS are cruelly racked, and the general strength gradually wasted by a persistent Cough, which Dr. Jayne's Expectorant may be relied on to cure. It will certainly benefit you also, if troubled with either Asthma or Bronchitis.

The Querist.

ANSWERS TO CORRESPONDENTS.

Live Weight of Animals.

A. D. Foster.—Is there any rule for finding the weight of an ox by measuring his girth, length, etc.? If so, please state it in the RURAL.

ANS.—For the convenience of this correspondent and two others who have put a like question, we republish, from a back number of the RURAL, the following rule for ascertaining, within a trifle, the live weight of all kinds of stock:

Take a string, put it around the breast, standing square just behind the shoulder blade; measure on a foot rule the feet and inches the animal is in circumference; this is called the girth; then, with the string, measure from the bone of the tail which plumbs the line with the hinder part of the buttock; direct the line along the back to the fore part of the shoulder blade; take the dimensions on the foot rule as before, which is the length; and work the figures in the following manner:—Girth of the bullock, say six feet four inches; length, five feet three inches; which, multiplied together, make 31 square superficial feet; and that multiplied by 23 (this number of pounds allowed to each superficial foot of cattle measuring less than seven and more than five feet in girth,) make 713 pounds. Where the animal measures less than 9 and more than 7 in girth, 31 is the number of pounds to each superficial foot. Again, suppose a pig or any small beast should measure two feet in girth, and two along the back, which, multiplied together, make 4 square feet; that multiplied by 11, the number of pounds allowed each square foot of cattle measuring less than 3 feet in girth, makes 44 pounds. Again, suppose a calf, a sheep, &c., should measure 4 feet 6 inches in girth, and 3 feet 9 inches in length, which, multiplied together, make 15½ square feet; that multiplied by 16, the number of pounds allowed to all cattle measuring less than 5 feet, and more than 3 in girth, makes 265 pounds. The dimensions of the girth and length of black cattle, sheep, calves or hogs may be as exactly taken this way as it is at all necessary for any computation or any valuation of stock, and will answer exactly to the four quarters, sinking the offal, a sum which every man, who can get over a bit of chalk, can easily figure.

The following rules are also recommended by English usage:—(1) Multiply the square of the girth by the length, both in inches. The product, multiplied by decimal .7958, will give the contents in cubic inches, which divide by 576; the quotient is the weight in imperial stones, 14 pounds to the stone. Or, (2) multiply the square of the girth by the length, both in inches, and divide by 7238; the quotient is the weight, stones imperial. Or, (3) multiply the square of the girth by the length, both in inches, and multiply that product by .00013816; the product is weight in imperial stones. Or, (4) square the girth, multiply by five lengths and divide by 21; the quotient will be the weight in imperial stones.

Keeping Goats.

F. G. Webb, West Va.—Will you give us through the RURAL NEW YORKER some information about raising goats? Is there a market for their hides, and could they be made profitable? We have here a vast amount of mountain land which might be utilized by breeding goats, provided it could be done with profit.

ANS.—A satisfactory answer to this question could only be based on previous experience in this country and such an experiment has never yet been made. In many mountainous districts in Europe, especially in Norway and Switzerland, goat-keeping forms an important branch of industry, but more for the cheese and butter made from their milk, generally mixed with equal parts of cows' milk, than for the profits from their skins. Those of the kid and goat, however, are valuable, the former for making gloves, and the latter for the manufacture of the finer kinds of shoes, being soft, elastic and durable. The flesh of the kid is somewhat like venison and that of the goat by no means unpalatable, partaking of the flavor of mountain mutton. The presence of capric acid imparts a slightly peculiar, though not unpleasant odor to the milk, of which a good goat will yield a quart three times a day, and which is richer and more digestible than that of the cow, and in tea is as grateful as cream. About a dozen years ago the Angora and Cashmere breeds of goats were introduced with considerable *eclat* into different parts of this country, notably at Gallatin, Tenn., and in Guernsey Co., Ohio, but of late little is known to the public of the results of the experiments. The chief trouble in keeping goats lies in their exasperating aptitude for getting into mischief, but in the wide mountain range in your neighborhood this source of annoyance would be reduced to a minimum.

J. D. Curtis, East Syracuse.—Will you please inform me, at your earliest convenience, (1.) where and of whom I can obtain "Willard's Practical Dairy Husbandry," (2.) also at what price.

ANS.—(1.) The Orange Judd Co., New York City. (2.) $3.

Swamp or Spotted Alder.

A. E. B.—Can some one tell me, (1,) the best means of getting rid of the common swamp or spotted alder? I have a swamp running through my farm containing 7 or 8 acres thickly grown with alders. I think of sometimes putting a wide, deep ditch through the whole length of it, as a drain, a small brook of first-rate water runs through it. Some say cut them down in the month of August and they will not sprout again. I have tried this but they sprouted some. I have just one more question to ask, although not pertaining to the farm. (2.) Is there the same attraction for the magnetic needle at the South Pole as at the North, if so how does it stand when on the equator.

ANS.—(1.) We know of no better way than to continue to do as you have done. (2.) There are two magnetic poles, one in the northern and the other in the southern hemisphere; but neither of them is coincident with the terrestrial poles. At present the north magnetic pole is situated in the extreme north of the American continent, probably about 400 miles southward of the terrestrial pole, round which it is moving slowly from east to west, completing the circuit in about 650 years. There are multitudinous magnetic influences, arising from terrestrial, lunar and solar influences, which affect the direction in which the compass points, so that its variations or declinations are extremely irregular. It is only along certain lines—called lines of no variation—that the needle points towards the pole. Such a line at present passes near Wilmington, N. C., Charlottesville, Va., and Pittsburg, Pa. On the east of this line the needle points away from the pole towards the west and this variation amounts to 6 degrees at this city, while at Portland, Me., it amounts to 18°. The equator does not mark the line which determines the superior influence of the north or south magnetic poles. This is extremely irregular at any single moment and is constantly varying, so that science has hitherto been unable to determine either the nature or source of terrestrial magnetism.

Jas. K. Booker, Tuscarawas Co., Ohio.—I have several questions to ask the many readers of your paper. 1st. Will bees work well without a queen, a bee-keeper here says they do. 2nd. I have a stony piece of ground, and want to fill up a ravine close by, had I better throw the stones in miscellaneously or form dams across it?

ANS.—(1.) Bees gather but very little honey and pollen when without a queen, if they have no queen cells, or eggs, or larvæ to make one; but when supplied with one of these, they work as well as they do with a mature queen, because they know that they will soon have one. (2.) In filling up your ravine with stones, you had better throw them in loosely, the largest at the bottom, and the small ones into the interstices, so as to allow the water to flow off through them. We see no benefit in "forming dams across it," whether you design to have an outlet or not. You will require, at least, eighteen inches of soil on the top to render it in good condition for cultivation.

Beets and Carrots on Muck Soil.

Van.—Can you or any of your readers tell me through the RURAL whether beets or carrots will grow and do well on muck soil.

ANS.—Carrots can be cultivated with profit on such a soil, provided it is well cultivated and thoroughly pulverized; but of course, they would do much better on a rich loamy or gravelly soil. This kind of soil is also the best for beets, and experience has taught us that when these are grown on ground naturally moist and rich in humus, the roots are watery and very thick, are liable to be hollow in the middle and hard to keep in good condition.

Buckwheater.—Will the RURAL please tell me how far north bees can be kept with profit?

ANS.—Bees are kept successfully as far north as Montreal and Quebec, Canada. Anywhere where bees can gather honey plentifully six weeks in the year, they may be kept profitably.

J. A. Younge.—Twenty-five acres of my farm are river flats and are overflowed every spring, on which account the fences have to be removed every fall and replaced every spring, the ordinary rail fence being used. Would you or any of your readers tell me what is the most substantial, and convenient yet cheapest fence for my purpose.

[Will somebody please answer.—EDS.]

News of the Week.

HOME NEWS PARAGRAPHS.

Diptheria is prevailing to an alarming extent in New-Brunswick.

About 125,000 bushels of clover-seed are annually sent from this country to Europe.

The amount of deposits in the Savings banks of the United States is estimated at $1,500,000,000.

Throughout the cotton-producing States, the average yield of cotton per acre is 178⅘ pounds, valued at $19.61.

Of the 270,000 voters in Kentucky, 90,000 cannot read, and more than 40,000 of the men who cannot read are whites.

In Central Georgia the annual average cost per head of keeping sheep is fifty-four cents; average cost of raising a pound of wool, six cents.

Canadian statistics show that a large number of French emigrants of the better class are regularly arriving and settling in the Dominion.

During November, 4,745 immigrants arrived at New York, 1,489 from Germany, 841 from England, 605 from Ireland, and the balance scattering.

Tobacco has been such a profitable crop in Wisconsin this year, that the farmers intend to go into the business more extensively next season.

There are about 70,000 orange-trees in bearing in Louisiana, yielding over 30,000,000 oranges annually, which are worth on the trees about $100,000.

A suit about a yoke of steers has just been decided in Campbell county, Georgia, after fifteen years' litigation, in which the costs amounted to $1,500.

Severe frosts on the 29th and 30th of November solidified the juice in the standing sugar cane in portions of Louisiana, and have caused immense damage.

Tobacco leaves are fatal to cows, as a Kentucky farmer learned a few days ago by losing three valuable animals which ate some of the weed with their hay.

Florida hogs average a value of $2.72. The average hog in Maine is worth $10.11; New Hampshire, $14.99; Vermont, $10 31; Massachusetts, $14.80; Rhode Island, $13.80; Connecticut, $15.74; New York, $10.30.

A physiologist estimates that there are 2,400 disorders to which the human frame is liable, and there are plenty of people who believe they have every one of them.

It is a singular coincidence that all of the United States ships lost in the last ten years were named after Indian tribes, viz., the Saranac, Saginaw, Idaho, and Huron.

A German woman is at work in Meriden, Ct., digging ditches for gas pipes. She does not heed the gaze of the idle but handles her pick and shovel to good purpose.

There are six families in West Middletown, Allegheny County, Penn., that contain sixty-eight children. The smallest family contains ten and the largest fifteen children.

The Tax-Collector's books show that the value of real estate, subject to taxation, in the city and county of San Francisco, is $190,972,880, and the personal property, $63,730,080.

Chinamen have been destroying the fish in Napa River, Cal., by some poisonous compound which kills every form of animal life, and makes the water unfit for household purposes.

A Lewis County, Mo., farmer, sold his wool crop for $3,380, and Missouri farmers generally are beginning to see that there is money in sheep, and are increasing their flocks or starting anew.

Fourteen bushels of chestnuts have, this fall, been sent in small packages by mail, from Merrimack County, N. H., to Helena, Montana. The postage on them was $102.37, or $7.31 per bushel.

A Minnesota farmer's boy brought the village editor an ear of corn which was truly wonderful for size. It measured 11½ inches in length and 10½ inches in circumference, and contained 1,620 kernels.

The Illinois Central Railroad has arranged with the New Orleans and Liverpool steamship line, so that grain can be carried from Chicago to New Orleans, at 40c. per hundred, and to Liverpool for 70c.

The population of Georgia is 1,264,240, and the number of hogs is 1,261,440, or one hog for every person in the State, and 200 hogs left over with which to regale the strangers that may happen within their gates

The farmers of North Alabama find great difficulty in procuring hands for field-work, in consequence of which half the cotton crop remains in the field, and will necessitate a good deal of financial embarrassment.

The returns from the savings banks of Massachusetts for the year show a large decrease in deposits, roughly estimated at $3,000,000 to $4,000,000. This is the first time in the year that there has been a falling off.

The superintendent of a factory in Canada, which manufactures paper from wood, says that the process is now so much improved that the paper can be made ready for use in six hours from the cutting of the tree.

Illinois, this year, is the great corn-producing State. With this grain 8,935,411 acres were planted, which gave an estimated average yield of 38 bushels per acre, aggregating a total product of 340,528,246 bushels.

On the 30th of November, Henry M. Marvin of Boone Co., Ind., sold eighteen fat pigs, thirteen months of age, for $4 per hundred gross, that weighed 818 pounds each, after being driven over a rough road seven miles.

The first prisoner at the Joliet, Ill., penitentiary, was received in 1858, and since that time about 12,000 prisoners have been committed. The largest count was on Nov. 26 of this year, when the inmates numbered 1,865.

The permanent exhibition in Philadelphia has received in all since it was opened, last May, $107,600, and now has a debt of $275 000. Neither opening it on Sundays nor closing it seems likely to save it from bankruptcy and the sheriff.

Connecticut valley tobacco raisers have nearly stripped this year's crop, and report that it is an unusually good one, despite contrary opinions earlier in the season. Prices promise to be lower, the New York strike having had a depressing effect.

Texas made this year 700,000 bales of cotton, from which will be 840,000,000 pounds of seed. This seed, converted into oil, would bring over $14,000,000. The total exports of cotton from the port of Galveston for the season just closed, were 495,814 bales, of which 256,928 went to foreign and 238,866 to domestic ports.

FOREIGN NOTES.

At Glasgow, Scotland, one iodine factory uses up 6,000 tons of seaweed every year to produce this chemical.

The highest price paid in the Egyptian market for the young Nubian women is $500, and for fair Circassians $3000.

Berlin is celebrated for its excellent schools, but teachers there receive only about two hundred and fifty dollars a year.

French statistics record on an average about 200 cases annually of hydrophobia. There are said to be 3,000,000 dogs in France.

It is only lately that the flavor of Wintegreen has been known in Europe, but now it has become all the rage with confectioners.

Beef can be bought in Belgrade at one penny per pound, and forwarded to London by express trains in six days, or less, at a cost of three farthings a pound. Fat pigs can be bought for 2½d. per pound, and lambs at £1 per score.

Milan is preparing for an International Exhibition in 1879. The outlay for the building, which is to be in the London Crystal Palace style, is set at the modest sum of $150,000, two-thirds of which sum have already been subscribed in England and the rest in Italy.

British India is becoming a strong competitor for the tea trade of the world. In 1861 only 1,300,000 pounds were exported from Hindoostan, but the export has now grown to more than 25,000,000 pounds, and the area of land brought under tea culture is increasing even more rapidly.

English experience in dressing well-fed hogs is as follows: The per cent. of pork from a hog, the live weight of which is above 550 pounds, is 87 to 88; a hog live weight 500 to 550, 84 to 86 per cent. of pork; 350 to 400, 81 to 82 per cent.; 200 to 300, 78 to 80 per cent.; under 200 pounds, 75 to 77 per cent.

The Australians are turning to good account the rabbits unhappily introduced to that country, and which have increased so rapidly as to cause wide-spread damage. During the month of August 59,457 rabbits were potted, chiefly for export. Thousands of skins are sent to England for use in making hats.

The following are some of the endowments of colleges and schools in Ireland: Trinity College, $300,000; Queen's University, $200,000; the Royal College of Science, $40,000; the Diocesan, Royal, Irish Society, Erasmus Smith, and other endowed schools, $210,000; and the Training and Model Schools, $285,000.

It seems the English bees imported a few years ago into Australia are on a strike. The perennial Summer of those parts of the country where they were located gave them opportunities for seeking food at any time. Hence, there being no freezing weather to destroy the sources of their food, they ceased storing up honey either for themselves or their owners. Their hives are simply castles of indolence.

Concerning the English wheat crop J. B. Lawes of Rothamstead, states that the average yield per acre in number of bushels is very nearly the same in 1877 as in 1876, but that the quality, as indicated by the weight per bushel, is much inferior in 1877. Thus the average weight per bushel on the selected spots in the permanent wheat fields was 2¾ pounds, and among the varieties of wheat nearly 3½ pounds less in 1877 than in 1876.

The Best in the World.—The superiority of Wheeler & Wilson's New Sewing Machine is as clearly established as human testimony permits. In addition to the Vienna, Centennial and other awards, there is an unbroken series of American Institute awards for five years, published in another column, that unqualifiedly proves this Sewing Machine "*the best in the world.*" Still it is sold on as favorable terms as any in the market.

Happy tidings for nervous sufferers, and those who have been dosed, drugged and quacked. Pulvermacher's Electric Belts effectually cure premature debility, weakness and decay. Book and Journal, with information worth thousands, mailed free. Address PULVERMACHER GALVANIC CO., Cincinnati, Ohio.

PERSONAL ITEMS.

SENATOR MITCHELL of Oregon, is a little, clean, dark man, as bright as a sparrow.

IT was Goethe who said that modern poets put a great deal of water in their ink.

THE often quoted remark, "Nothing succeeds so well as success," was Talleyrand's.

JAMES GORDEN BENNETT is reported to be engaged to a handsome young French countess residing in Paris.

ADAM CLARKE said the reason the Irish made so many bulls was because they thought so much faster than they spoke.

ROSSINI was insufferably conceited, and declared himself, in a letter to his mother, to be the handsomest man in Italy.

ALVIN CLARK, the great telescope manufacturer at Cambridge, began life as a portrait painter, with a studio in Boston.

THIER'S mother was cousin to Andre Chenier, the poet and Girondist, who suffered death during the French Revolution.

MISS CAMILLA WEBB, once a clerk in the treasury department at Washington, and a beautiful blonde, is now the Countess von Harvre.

BAYARD TAYLOR is a Pennsylvanian by birth. His first published work was "Views a foot; or Europe seen with Knapsack and Staff," in 1846.

INDIAN JOSEPH says:—"I will fight no more forever," but then we wouldn't like to give him a good chance, for all that. Indian nature, you see!

MRS. CHISHOLM, widow of Judge Chrisholm, who was murdered in Mississippi, has been appointed to a clerkship in the Treasury Department.

ROSA BONHEUR wears her hair cut short like a man's, and affects masculine attire. All accord to her the reputation of being the best living animal painter.

RAPHAEL died at the age of thirty-seven, and yet there are at least a thousand "authentic" pictures by him still extant, in public and private collections.

MRS. GENERAL CUSTER is living in New York on the small pension she receives from the Government and her salary as secretary of the Ladies' Art Association.

WILLIAM W. CORCORAN of Washington seems to occupy his whole time in acts of practical benevolence. He possesses the will and the means, like Miss Burdett Coutts of London.

THE Czar is said to be a good linguist. He delights in French novels, plays, and music. He is a man of great goodness of heart, and is said never to have quarreled with a personal friend.

MAGGIE MITCHELL is over 40, though upon the stage she looks to be but about 18 years of age. She was born in the Bowery, New York, and has amassed a fortune of $300,000 by her profession.

MRS. A. T. STEWART, who is now 70 years of age, had a severe fall lately, while descending the marble steps in her Fifth avenue mansion. She was badly bruised and her wrist was fractured.

HON. D. N. LOCKWOOD of Buffalo, is the youngest member of the New York delegation in Congress, having been born in 1844; and Hon. George W. Patterson of the Thirty-third district, is the oldest, having been born in 1799.

MANAGER GRAU, who has just died in poverty in New York, experienced remarkable vicissitudes of fortune. He was once worth nearly half a million of dollars, and was said to have realized $200,000 profit by bringing Ristori to this country.

SENATOR DAVID DAVIS is a great land lawyer. When he did not take land for his fee as attorney he bought land with the money earned until he became a very heavy owner of real estate. He is quite wealthy, but his money is all invested in this way.

MRS. JOSEPH, the sole wife of the Nez Perces chieftain, is a pretty little black-eyed beauty, with flashing teeth, fine arms, and dainty feet. They now have one papoose a year old, their only daughter, a young girl, having mysteriously disappeared the morning of the last fight.

MR. CONWAY says of Forbes the London News's correspondent: "This man whose pen, has really modified the history of Europe, is one of the most modest and amiable of persons. When he entered the field of journalism his sole ambition was to do perfectly what he was required to do, and it has, I believe, been without the slightest effort to accomplish world-wide effects that Forbes has accomplished them."

Implements and Machinery.

Switzerland to America Greeting.

The Centennial Judges having awarded to the Messrs. BOREL & CODRVOISIER 2 Prizes at the late Centennial Exhibition for their production, one for extreme accuracy in adjustment and regularity in performance, and the other for Watches at a great reduction from display, they are now offering their former prices, having introduced improved machinery, whereby the production is increased, and the cost of manufacture greatly reduced, and the quality and durability very improved, insuring a first-class NICKEL MOVEMENT WATCH within the reach of all. These Watches, so favorably known for the past 18 years, are made of the best material, and have all the modern improvements in watch making having **Chronometer Balances, Breguet Hair Springs, Tempered, Hardened and Isochronised for R. R. Travel, Fine Ruby Jeweled,** and are warranted to perform with the regularity and accuracy of a Chronometer. These Watches are for sale by all our local agents throughout the country, and parties desiring a good and durable time-keeper, are requested to examine them before purchasing those of other manufacturers or home productions.

PARTCULARLY

FOR THE LADIES!

THE RURAL NEW-YORKER, at the instance of Miss FAITH RIPLEY, conductor of the Department "For Women," offers, as one of the most valuable and acceptable Premiums of the season, a Steel-Plate Engraving, size 24x32.

The subject,

"OUGHT AND CARRY ONE,"

portrays a pretty young girl, gracefully poised, and holding pressed against her side a slate on which she is "doing sums." The contracted brow, puzzled expression and drawn corners of the mouth, express most comical dismay.

This charming picture is printed from a new plate, the lights and shadows are clearly defined, and this work of art, when nicely framed, is a decided ornament.

Nothing is more refining and elevating than *good* works of art, and we confidently proffer this as something greatly in advance of anything heretofore announced.

We anticipate that this offer will appeal especially to our lady readers, and in order that the picture may be placed within the reach of all, we have scaled the club so low that it partakes more of the nature of a gift than a premium.

5 SUBSCRIBERS AT $2 EACH,

will entitle any one to the Engraving.

For specimen copies and outfit for canvassing, address

[Entered according to Act of Congress, in the year 1877, by the Rural Publishing Company, in the office of the Librarian of Congress at Washington.]

THE LUXEMBOURG GARDEN, PARIS.

On the left side of the Seine, beside the palace of the same name, in the heart of Paris, are the gardens of the Luxembourg, scarcely inferior in beauty to those of the Tuileries, until the Communists partly despoiled them of their attractions during the revolt in 1871. Covering an area of eighty-five acres, they are still exceedingly interesting and highly instructive to the horticulturist. They are laid out with all the taste and judgment that distinguish the works of the best French landscape gardeners, and are entirely free from the incongruous obtrusions of the purely artistic element which, to the taste of Englishmen and Americans, appear somev hat meretricious on many of the other parks and gardens and around the gay capital of France.

For many years back, they have fortunately been under the management of one of the clearest-headed and most accomplished gardeners in Europe, M. Riviere. Thanks to him, most of the traces of communistic violence are now obliterated, and, like Eleazer's temple of old, it is only those who remember their former beauty who bemoan their present inferiority, while strangers are loud in their praises of the attractions that still render this place one of the most charming spots in the city. Among the interesting relics of by-gone days, yet preserved in perfect health, are a multitude of old Oleanders in tubs. In winter, these are stored in the Orangery, and when placed out-of-doors, in the genial summer time, they often flower as freely as beds of scarlet Pelargoniums. There is also a very excellent collection of orange trees, around which are always congregated a number of curious admirers. A small portion of the garden is devoted to fruit culture, and from the study of this model of its kind, visitors interested in fruit-gardening might learn much in all that relates to the training and cultivation of fruit trees.

The floral decoration out of doors is, for the most part, composed of a mixture of hardy herbaceous and tender bedding plants, the borders being usually gay with spring flowers before those from the conservatories are placed in the open air. Here there is no early summer clearance of the beds, as the plants that succeed each other, are "stolen in" from time to time, so as to allow no trace of bareness after the winter is passed. There used to be here a very large collection of vines, one, indeed, of national importance, but it has lately been transferred to the Acclimation Garden in the Bois-de-Boulogne. The hot-house department is rich in the possession of the best collection of Orchids in any public garden around Paris, and the Camellia-house also is abundantly stocked. The common honeysuckle is grown a great deal in the gardens as a low standard bush, freely cut back in the winter.

VIEW IN THE LUXEMBOURG GARDEN, PARIS.

M. Riviere is an able lecturer on fruit culture, pruning, and the like, and during the winter and spring speaks to large audiences in the Orangery. The custom of lecturing on pure gardening, as distinguished from botany, is common in France, and is the cause of the widespread knowledge of fruit trees and their treatment among the inhabitants of that country. Even amateur workmen and laborers possess this knowledge to a high degree, and, considering the large number of small farmers each of whom has generally an orchard patch, the acquisition is extremely useful. In lectures on such topics here and elsewhere throughout the country, the discourse is abundantly illustrated by living specimens exemplifying the points under discussion, and frequently the professor and class visit some famous garden for a still more effective illustration.

A peculiar charm is imparted to the Luxembourg gardens by stately avenues of graceful trees and secluded walks, shaded by dense masses of odoriferous shrubbery, while fine terraces, here and there, diversify the scenery, and frequent groups of classic and symbolic statuary, half-hidden by umbrageous foliage, embellish the long vistas. This is a favorite lounging-place for the gay Parisians, and groups of promenaders may be seen, at all times, enlivening the smooth asphalt-coated walks, while the numerous seats are occupied by groups of noisy, laughing children, interspersed by their sedate elders smilingly watching the youngsters' gambols or placidly enjoying the beauty of the scene.

In France, horticulture has for ages received special attention. As long ago as the year 786, Charlemagne, by royal edict, established a number of public gardens, prescribing the very plants which were to be grown, and, amidst the multitudinous cares that must have pressed heavily on the absolute monarch of so vast an empire, he still found time to personally see that his orders had been obeyed. Towards the end of the 16th century, Henry IV., of France, had collected in the garden of Montpelier upwards of 1,300 French Alpine and Pyrenean plants.

Farm Topics.

AGRICULTURE AND EDUCATION IN THE UNITED STATES.

PROF. I. P. ROBERTS.

No. 1.

In order to arrive at a full understanding of the principal causes that have produced such marvelous changes and improvements, not only in methods and increased wealth, but in general education and technical knowledge of the rural or agricultural population, it will be necessary to state briefly the conditions and circumstances of the rural classes of Europe in former times. It will not be necessary, however, to go back farther than the seventeenth century as, prior to this period, changes in wages and condition were not of a marked character or in any wise permanent.

Taking 1685 as the period from which we soon see in England permanent improvement, though small both in condition and wages, we find that gross ignorance was the universal rule, and abject poverty the inevitable condition of all the common people. And how could it well be otherwise? For wages were fixed by law in Warwickshire at 4s. a week (16c. per day) without food, from March to September, and 3s. 6d. from September to March.

In some other counties they were fixed at a slightly higher rate—as in Suffolk, 5s. for winter and 6s. for summer. EDWARD YOUNG, in "Labor in Europe and America," from which many of these statistics were taken, states that "Meat was cheap as compared with present prices, but hundreds of thousands of families scarcely know the taste of it."

Wheaten bread was not even thought of, as the average price per quarter for wheat during the last twelve years of CHARLES II. was 50s. The great majority of the people lived almost entirely on rye, barley, and oats. The produce of tropical countries, mines, and machinery—such as sugar, salt, coals, candles, soap, shoes, stockings, and generally all articles of clothing and bedding—were positively dearer than at present. From this time (1685) forward, there appears to have been a steady and permanent increase not only in wages, but in the money value of the products of the farm. Manufacture received a great impetus from the influx of French fugitives which followed the revocation of the edict of Nantes, in 1685. It is estimated that a half million of Protestant French, most of whom were skilled artizans, with a cash capital and effects to the value of upwards of three million pounds sterling, settled in England. This had a marked effect both on wages and products, and evidences of still more increased prosperity quickly followed the peace of Ryswick, negotiated, September, 1697.

Perhaps no period in the history of England shows, all things considered, so rapid progress in diversified industries as the last quarter of the seventeenth and the first quarter of the eighteenth centuries.

The colonies of North America about this time, offered great inducements to immigrants, and they appear to have been successful, for Pennsylvania alone received in 1729, 6,200 immigrants.

The New World was the longed-for land, the ideal paradise to many an oppressed and half-fed laborer of the Old. It was the great subject to be talked of by day, discussed at the little gathering in the evening, and dreamt of by night. All of the causes that conspired to produce the marked advancement in the education, methods, and not results of the tillers of the soil, we may not know; but certain it is that those enumerated had a marked effect; not directly, by giving better methods and imparting technical instruction, but by arousing thought and energy; by creating a desire for, and participation in, more of the comforts of life; by lifting the laborer out of the position of abject servitude which sometimes was worse than slavery, and clothing him with the attributes of manhood.

The discovery and peopling of North America has been of more benefit to mankind directly and indirectly, than any other event that has transpired for the last thousand years. We now come to the beginning of the age of machinery adapted to manufacture, which in time affected very materially the development and improvement of modes and implements of agriculture, and these in turn, a little later, had a great influence on the education and elevation of the food producers.

In 1738 JOHN KAY of Lancashire, invented a new method of throwing the shuttle, by which the weavers were enabled to nearly double the amount of cloth. About the same time, LEWIS PAUL invented a machine for spinning cotton or wool by the aid of rollers.

In 1764, HARGREAVES invented the spinning-jenny.

About 1769, ARKWRIGHT produced the spinning-frame; and these in turn were improved and combined into one machine called "The Mule," by SAMUEL CROMPTON, in 1775. CARTRIGHT, ten years later, produced the power loom.

During this period, great improvement was made by Lord DUDLEY in the smelting of iron with coal, instead of charcoal; this, in turn, stimulated many branches of hardware, notably that of manufacture of nails. Towns were built up rapidly and permanently, and the evidences of thrift and growth were on every hand. The wages of the farm laborer and the profits of the farm were on a steady increase, and agriculture was materially benefited by finding a near and ready market for its products.

The inventions spoken of, and others which for a time appeared to be a universal benefit, proved to be the means, in some instances, of degrading and oppressing a portion of the working classes, particularly the women and children engaged in the factories. We are all more or less familiar with the effectual efforts of Sir ROBERT PEEL, ROBERT OWEN, and others, to induce Parliament to enact laws restricting the hours of labor and prohibiting the employment of children under certain ages.

Meantime, the thirteen American States had acquired their independence, and the war that secured it was another great educator. The British soldiers, on their return, verified many of the stories that before this had only been half credited, of the richness of the soil and mines, of the healthfulness of the climate and, above all, the perfect freedom and equality of the people. Many of the soldiers remained in the New World, or in time returned, and soon came to love and respect a people they had so recently despised and hated. The citizen-soldier of the Colonies had also become better acquainted with his own country, by having seen much of it on his marches and by coming in contact with those of distant localities. Both the British and American, by their increased opportunities for observation and for acquiring a knowledge of a variety of facts—or, in other words, becoming better educated—formed a more accurate conception of the grand possibilities of the future. At the close of the war, many of the soldiers of both armies returned to their farms with a better opinion and knowledge of their powers of mind and body, a tolerably clear understanding of their rights as citizens, and manhood enough to assert and defend them.

JETHRO HULL commenced his experiments on his farm in Berkshire in 1732, but they appear to have had little influence on agriculture until about thirty-five years later, when the most valuable features of his system began to be adopted. The old modes rapidly gave way to new and better ones. Drill culture and rotation of crops were largely practiced; the cultivation of turnips and potatoes increased rapidly; clover was introduced into the rotation largely, and timothy supplemented it at a little later period. Improvements in domestic animals followed quickly. All of these advances in methods and systems required increased knowledge and skill. New ideas were continually being advanced, discussed, pondered over, and adopted or rejected. The same eager desire for more light, increased remuneration, and greater freedom, was seen, to a greater or less degree, on the continent.

My object in writing this article—which is a kind of preface to what is to follow—is to try and point out some of the causes of our rapid advancement in education and material wealth. In order to do this, it appeared necessary to trace briefly the conditions of agriculture and those engaged in it and other pursuits; for even our immense natural resources (formerly undeveloped), our mammoth rivers and inland seas, and our almost unlimited extent of territory, will not account for it all.

We hear much in these days of natural selection, but no illustration on so grand a scale has ever been witnessed as we behold in the United States. Our immigrant ancestors were largely composed of self-selected people of the Old World. The brave, the energetic, the dauntless, the liberty-loving, the haters of oppression, ignorance, and injustice, formed the sure foundation on which they and their children builded so nobly and well.

A nation might be formed under more favorable circumstances, but a nation never was. No such spectacle has ever been witnessed of a nation with territory sufficient for a dozen respectable empires, reclaimed from a wilderness, conquered by the arts of peace, and rising by its wisdom and education from a few sparsely-settled colonies to a position of power, wealth, and refinement, that challenges the admiration and wonder of the civilized world. This selection of the fittest, explains the miracle that has been wrought in our land during the past century.

Cornell University, N. Y.

WESTERN FARM TOPICS.

PROF. EDW. M. SHELTON.

Up to December 1st of this year, we have received, during the eleven months of 1877, a total rainfall amounting to a fraction over 42 inches, which may be called a fair showing for this drought region of the "Great American Desert." Since that date we have had one week of delicious Indian Summer, without frosts nights, the thermometer going up to 65° two or three times. This was followed by two weeks of nearly continuous fog banks and drizzling rains, varied with a couple of sharp thunder storms, just such weather, in short, as I have seen in Southern Illinois at this season; which is saying about as mean a thing of the weather as I am able.

THE WILD GRASSES.

Taking the West as a whole, there is no other single crop that nearly equals the spontaneous crop of wild grasses that annually cover prairie and plain with the densest verdure. I need not multiply arguments to prove this proposition. Let it be remembered that well-nigh all the cattle obtained form the vast grazing regions West of the Missouri River, all the "Texans" "Cherokees" and American cattle of many names, to say nothing of sheep, are "made" on the wild grasses of this region. And yet this immensely valuable product rarely figures among the "available assets" of a State. Even the fervid imagination of the real-estate agent rarely riots among the wild grasses of his unsold lots. Tourists, speculators, and newspaper correspondents, while marveling at the "crops" and the flocks and herds, unite in ignoring the grasses which make flocks and herds possible. Our own farmers are equally indifferent to the importance of this subject. Thousands of acres of prairie land are annually broken up for grain crops, never so sure and only in favorable seasons so profitable as the original prairie grass.

The advantages of these prairie grasses may be summed up in a line: they furnish excellent pasturage, and when cut in the proper season, a good quality of hay; but they are pre-eminently valuable to the Western farmer, because the severest droughts but lightly effect their growth, while neither grasshoppers nor chinch bugs, the twin scourges of our farms, have ever been known to injure them. I certainly do not think of any cultivated plant for which so much as this can be said. Within the past four years I have seen corn selling in our rural towns at $1 per bushel, and wheat and oats an almost total failure the year following, but I have never yet seen the native grasses of Kansas reduced to even a half crop.

But all this is only one side of this question, although it is the side usually overlooked. There is another side to the picture with which farmers are too familiar, but which equally must be told. The prairie grasses are as wild as the Indian and the buffalo, and even less tamable. They endure mowing well, but even when moderately pastured, they disappear never to return. In old pastures, and in the vicinity of towns, indeed wherever the native grasses are closely pastured, the character of the natural herbage changes rapidly, the perennial grasses give place to annuals greatly their inferiors, and in the transition weeds rapidly multiply. Upon the alluvial bottoms adjacent to this city, where only a few years since waved luxuriant grasses "waist high," are now seen dense masses of coarse weeds alternating with patches of feebly growing annual grasses. Moreover, the wild grasses are late in starting in the spring, rarely making good feed before the middle of May in this locality, and the first frosts of the fall end their growth for the season. In this way our winters, so far as feeding is concerned, are lengthened nearly or quite two months beyond what they would be had we the tame grasses.

It will be seen that these are serious defects in the character of our wild grasses, largely offsetting their other sterling qualities; nevertheless, I most earnestly counsel every farmer living west of the Missouri River, who owns a field having a good stand of prairie grass, to allow the invading plow to enter it on no pretense whatever. Such a field should be treasured as the English farmer treasures his permanent pastures, or the Eastern farmer his wood lots.

TAME GRASSES.

West of a line drawn north and south through the city of Lawrence in this State, there are many patches of blue grass growing in door-yards and occasionally a small field may be seen sodded over with some one of the tame grasses, but over all this vast area not one farmer in fifty ever sowed a handful of grass seed, if I except Millet and Hungarian, and there exists a widespread notion that Kansas is not adapted to the growth of the tame species. I shall spend no time in combatting this idea. Few of the people who argue against the possibility of growing the tame grasses here have any conception of the tremendous import of this reasoning; for if it can be shown that the cultivation of the grasses is from climatic or other causes, impossible, then it is proved, as conclusively as moral reasoning can prove anything, that this country is incapable of sustaining a dense agricultural population; that the slovenly scourging system called "pioneer farming" is the highest style of farming it is capable of, and that a large portion of these beautiful prairies must ever be given over to the nomadic herdsman.

But I am abundantly satisfied that even on the agricultural portions of Kansas, Nebraska, Indian Territory and Texas, several of the most valuable cultivated grasses may be successfully and profitably grown. I desire to state briefly a few of the facts of my own experience upon the college farm since 1873. In 1874 I began an experiment with fifty odd varieties of grasses and clovers, and of all these, Blue grass, Timothy, Orchard grass and Alfalfa have proved the most trustworthy. During this same season, although one of the most disastrous droughts ever known prevailed in the State, I cut two tons per acre of excellent Timothy hay, from ten acres of ground. In 1875, another season of severe drought in this locality, this field furnished excellent pasturage although in the sandy portions of it considerable injury was sustained from the dry weather. The year 1876 was a very favorable one in this State for all cultivated plants. During this season I cut over five tons of good Alfalfa hay per acre, at two cuttings, from two acres of ground, and another cutting of fully one ton per acre might have been taken before winter set in.

At this time we have, all told, fourteen acres of mixed Timothy, and Blue grass, seeded in 1875 and now forming as handsome a sward as can be found in Kentucky, three acres of Orchard grass, seeded last spring, and even now almost perfectly occupying the ground, and five acres of Alfalfa, which will easily cut one and a half tons of hay per acre every two months of the growing season.

In conclusion, I earnestly counsel Western farmers to sow grass seeds, and to those living west of the Missouri, I say sow Blue grass and Orchard grass for pastures, Timothy and Alfalfa for mowing; but sow in the spring, preparing the ground thoroughly as for wheat. I have tried this plan four years and have never once failed in obtaining a first-class catch.

Manhattan, Kan.

JOTTINGS AT KIRBY HOMESTEAD.

COL. F. D. CURTIS.

BEES are now wintered by our most successful bee-men in cellars. The cellars are kept dark with a direct ventilation out of doors. The ventilator is a wooden pipe so arranged that the current of air passing through it may be increased or limited according to the weather. The cellar should be dry and free from mold. Not three per cent of loss in swarms will happen when bees are wintered in a well ventilated, dry cellar. Bees now do well in this section and are rapidly recovering from the almost total annihilation which was caused by the epidemic a few years since. This disease which was so destructive ran for two years. It was a dysentery which attacked the bees during the winter. Mr. HEATON only saved one hive out of sixty. Our twenty swarms were all swept away. A few hives of bees help to make a farmer's table more attractive, and generally there is a little surplus which may be turned into cash. But few persons are calculated to be successful apiarians on any extended scale. We have only two in town, and they can work among their bees with perfect impunity. There is a sort of bee charm which a few persons have; they are the ones to make keeping bees a business. All others had better keep out of the way. They may take the chances and cover their faces and hands, and endure a few things for the love of honey, but to have all this bother and the stings which many hives would surely furnish, is both an anticipation and a reality which we do not care for.

English sparrows are migrating from the cities into the country. In the village, a mile distant, they have made their appearance this winter, and the homely things are likely to drive away all of the sweet songsters which help to make spring so welcome. It is a pity the enterprise was ever born which brought them to our land.

By accident we have discovered how to manage the check of a high-headed and hard-mouthed horse. Such a horse should be checked up, especially if it pulls on the reins, as the check will relieve the driver. When a horse is checked up tight it cannot kick up so readily nor will it incline to run any. To check and uncheck such an animal, take hold of one side of the rein with one hand and pull the head around towards you and then with the other hand put the check on the hook. It can be done with perfect ease when, if the person should attempt to pull the check directly back to the hook-line, it would be very hard work.

Three spoonfuls of meal are wasted every day when the measure is filled heaping full and in carrying it from the granary to the horses' mangers. A peck of corn ground in the ear is

fed to the working team three times a day. One of them is almost twenty-four years old, and the other is nineteen. Jack, the oldest one, gets hay, and Jim is still eating straw on account of his heaves. They work every day and are doing well, their coats being bright and glossy. A great many farmers think that corn ground with the cob will kill a horse if fed to him. We have found, on the contrary, from experience, that it is a healthy food, and that a team will do hard work on this diet and keep in good condition. If our old team were fed oats ungrounnd, one half of them would pass through them without mastication or digestion. We have tried this to our entire satisfaction, hoping by feeding grain whole, to save the miller's toll. If it is necessary to feed grain whole, it is best to feed corn in the ear. Some horses will eat it, cob and all, but most of them prefer to shell it off and then eat it. A team fed on corn will sweat easier and more than when fed on oats, but this does not injure them any. For hard driving, oats is the best feed, and when fed to old horses, they should be ground. The meal fed to our horses is always weted just before feeding. Then it is sweet and palatable. Corn meal will soon get sour when wet, and on this account should be freshly mixed, as a horse abhors any sour or rancid feed. We commenced this paragraph by speaking about the little wastes in the daily feeding—three spoonfuls a day scattered from off the heaped measure make one thousand and ninety-five in a year; this is equivalent to 27.37 quarts—almost a bushel a year. The same little waste occurs in the grain fed to other animals, which would add at least as much more to the average waste for the year.

Esquire DAVIDSON has just lost a fat cow, which may teach us all a good lesson. The cow was very old and he commenced fattening her early in the season. She did well so long as she could get plenty of green and succulent food. He intended to dispose of her to a butcher before winter set in, but did not succeed in doing so. About a week ago, she refused to eat, and seemed to be in very great pain. Physic was administered with no effect. She has since died, and an examination showed that her paunch, or first stomach, was full of unmasticated food. Not being masticated properly, it had remained in the stomach until it had fermented, producing colic, and resulting in death. Old cows as well as other animals intended for slaughter, should be gotten into condition before winter, as they will fatten much easier on green feed, and the risks can be avoided of dry, unmasticated food, which is liable to produce either scours or colic, as in the case of this cow. A better plan is to turn off all animals before their teeth are worn out and while they are in full vigor.

According to the statements of several of the neighbors, Guinea fowls have a new field of usefulness. The neighbors say they will eat potato bugs and keep the vines clear of them. One man is going to winter twenty-five on the strength of his faith in them. The experiment is worth trying, as they are an ornament to the farm, and their eggs are the best for making cakes, and they are good layers.

A Dorking hen was found dead the other morning under the roost. She was very fat, and unquestionably died from apoplexy, which is a common disease of over-fat fowls. Large breeds are much more liable to this disease than smaller ones. Some of our chickens persist in roosting in the stock-barn on the partitions between the stalls. The cattle in these stalls invariably get lousy, and the pests must come from the chickens. We never could make them roost in the hennery before snow came, and then some of them would make their way back to the stalls, however often they might be carried to the hennery. Such has been our experience for years, and there is no reason to suppose that these chickens will be any more obedient than the others. It occurred to us, that, however they might delight to sit on this roost, they would not like to stick fast, so we have to-day daubed coal-tar all along on the edge of the top-boards, between the stalls, and now we congratulate ourselves that the hens will vacate that roost.

P. S.—Later.—Time has demonstrated the perfect success of the experiment.

There were so few books on swine, and these were so antiquated, that they gave us but a limited idea of the progress in this important industry, and especially in the establishment of American breeds and the more modern ideas which have been developed among swine breeders, that we give a hearty welcome to the recent work on "Swine Husbandry," compiled and written by Mr. F. D. COBURN, of Kansas. The fact that from this infant State, which was an unknown region thirty years ago, there should emanate a valuable and instructive book on the subject is wonderful, but not so much so as the fact that this fruitful commonwealth is now really an empire in production and promise. Mr. COBURN's work brings the history of swine-breeding, and the literature pertaining to this industry, down to the present time. The author has been careful and painstaking, and has endeavored to treat the different breeds of pigs and sections of the country with equal fairness.

Farm Economy.

SOMETHING ABOUT MANURE.

(1.) CAN forest leaves be rotted by the first of next May, and what would be the most rapid process for decomposing them without using horse manure, as I would like to procure an almost pure leaf mold. (2) I am saving, separately, horse, hog, cow and hen manure, and wish to learn for what garden crop each is most suitable according to the latest experiments and best authorities. (3) In saving manure is it well to add ashes in alternate layers, and what is the most rapid method of rotting hen, hog and cow manures, so as to have them ready for use next spring. A. SUBSCRIBER.

Ans. (1.) Yes, sufficiently for use in flower-pots or in the garden: mix with them a small quantity of fine wood-ashes and moisten the mixture occasionally. A layer of powdered charcoal, mold, or earthy matter of any description, spread over the mass, will absorb and retain any evaporating ammonia. (2) It is neither customary nor advisable to keep separate the manure from the various sorts of animals on the farm, except perhaps, that from pigeons and the different species of poultry. Hog, and cow manures are both cold and somewhat slow in decomposing, whereas horse dung is hot and ferments readily, and when composted with the others acts as a leaven to the whole mass. Moreover, when the voidings and litter of the different animals are piled together, new chemical combinations take place, the contents of the whole heap are broken down more thoroughly, made finer, and consequently more soluble and therefore more readily available for manurial purposes; for it should be borne in mind that all fertilizers must be reduced either to a liquid or gaseous condition before they can be absorbed as food by plants. This probably accounts for the fact that no one has hitherto thought it worth while to attempt to overcome the great difficulties in the way of making accurate experiments with regard to the comparative effects of the manure from different animals on various crops.

Just think for a moment of the arduous nature of such an undertaking. The crop to which each sort of manure would have to be applied, must be grown on soil equally favorable to its special requirements, receive relatively the same degree of attention, and experience weather equally conducive to its growth. Moreover, each of these dungs is subject to great variations in efficacy on account of the age of the animal, its treatment, the purpose for which it is used, the amount and quality of the litter, the length of time during which the manure has been kept, the way it has been preserved, and, more than all, by the quantity and quality of the food upon which the animal has been fed. On the last point an experiment made by Mr. LAWES, the celebrated English agriculturist, is highly suggestive. He found that while a given quantity of voidings from cattle fed on cotton-seed meal was worth $27,96; the same quantity produced from carrots and turnips, was worth only 86 cents. Accordingly before a just estimate could be made of the relative values of the manures from different animals upon various crops, so many circumstances would have to be taken into account and provided for, that the result would not repay the consequent expense and labor; and neither practical nor scientific men are likely to incur a great deal of either the one or the other to gratify mere curiosity.

With regard to hen manure, however, experience has shown that it is equally good for strawberries, melons, squashes, sweet-corn, tomatoes, and, in fact, for all bulbs and herbaceous plants. Properly treated this is the most valuable manure produced on the farm. It may be kept mixed with mold, dry muck, or coal ashes, or preserved separate in barrels. In the latter case, when about to be applied, it should be reduced to a powder, and mixed with at least four or five times its bulk of mold, muck, or some other substance, for if applied undiluted, it will burn and kill the seeds and prevent germination. Or, just before placing it in the hill or drill, it may be beneficially mixed with wood-ashes, but care must be taken that fermentation does not take place before the mixture is buried, otherwise there will be a proportionate loss of ammonia. Moreover, to prevent injury to the seed there should always be a layer of earth, a couple of inches thick, between the seed and the poultry manure.

(3.) It is not advisable to mix ashes with decomposing manure, as their action is so powerful as to cause a too rapid fermentation and consequent escape of ammonia. Nothing accelerates the uniform decomposition of all organic substances more than putrid urine, or liquid manure; hence the advantage of a liquid manure tank in the neighborhood of a manure pit. Moreover, by pouring urine over the manure heap, this valuable fertilizer becomes incorporated with the mass, vastly improving its quality, while danger of its being wasted is in this way avoided. The fermentation of dung should not be carried on further than is absolutely necessary, for even with the greatest precaution, the loss by the escape of valuable volatile fertilizing substances cannot be altogether avoided.

SYSTEM IN FARMING.

THERE must be a system in every business if it is to succeed, and whoever ignores a clear foresighted way of conducting farming will soon have no farming; for if he is depending on it for a living he will become bankrupt, or if doing it for amusement, the drain on capital will be so heavy as to cause prudence to step in and end such a losing transaction.

Some men are so opinionated as to imagine themselves competent to manage a farm without any looking forward, and they will make inadequate preparation for winter and have nothing in readiness by the time it is wanted, and if anything goes wrong it is laid at the door of some other than the right person. There is not a more pitiable and contemptible man than the one who thinks himself smarter than any one else, and yet runs around seeking to charge all his shortcomings to others while he alone is to blame.

There are men who are too stingy to make good fences or properly repair those which are rotting or tumbling down, and who yet talk of being stock farmers, and they will buy grade short-horns, grade Jerseys, mongrels of all colors and sizes, and expect the public to admire their animals and believe them to be something superior. Now by using good pure-bred bulls and raising the calves, improvements could be made in these grades, but those niggardly souls will begrudge the trouble to raise the calves, and either sell them for veal or let them go with the cow to a dairy-man.

System would raise all the heifer calves, and by using good bulls each generation would become better. Or, any man with sufficient capital would commence with some really good pure-bred stock, and breed and sell first-class animals, and thus conduct the breeding on a system of continually selling at double and treble the price of common stock and gaining extra profits. System, too, will cause any man of intelligence to have every department methodically conducted, and not to have anything delayed or capriciously changed from the rotation or regular course. But the miserable, shiftless farmer will have a piece of plowing in the middle of a meadow and a field of corn or grain with no fence between it and the pasture, and then every neighbor will be complaining of injury from stock through the bad fences. He will also be so simple as to attempt to fatten, in the winter, cows which have been in milk and have lost their flesh and perhaps some coarse, thin, big-boned steers. A WORKING FARMER.

Miscellaneous.

RURAL TOPICS.

T. B. MINER.

WORK BY THE JOB OR CONTRACT.

WHEN one knows what it is worth to do a thing, as to split a thousand rails, make a certain number of rods of stone-wall or board-fence, put up an outbuilding, or paint a fence or house, it is better to have the work done by contract than by the day, unless the owner has men hired by the month, who can do some of these things, or unless he intends to work regularly with the man or men who are selected to do the work. It is surprising to see how the great majority of mechanics, and others, will "nurse" a job when at work by the day! They will frequently do a piece of work by contract in three days, that they would spend a week on if employed by the day; and there is no remedy for such robbing of an employer, as they keep busy the most of the time; but it is often in trying to see how long they can make the job last. But there are some jobs, as repairing buildings, when one does not know exactly how much is to be done, till he has commenced the work, the condition perhaps of timbers not being known from the first; and all such generally have to be done by the day; and a good way in such cases is, first to obtain all the materials to be used, before the work is commenced, or as nearly all as possible; and then let the owner be "on hand," when the carpenters commence work and see that it is done *right*, and he will often make good wages for himself, in merely letting his men see that he is superintending the work, although he may do no work himself.

Another important point is to have a plain agreement as regards what is to be done in contract work. There is no use in being sensitive in regard to telling a man, "here is what I shall expect you to do, put in writing. I dislike to have any altercation over work after it is done, and I have stated plainly what you are to do, and what I am to do; and then there can be no disputes between us. I take you to be an honest man, but there is no harm in both of us signing this contract to keep us honest." If it be a job of no great importance, no witness will be needed to the signatures; but in case of putting up a barn, or other building, it would be best to call a third party as witness. No man ever lost money or character by being cautious and particular in his business; but many a man has become poor from a neglect to exercise these qualities.

LAY IN YOUR WOOD.

No good farmer will neglect to cut wood this winter, to be used a year hence, as it is poor management to burn green wood; and it is always best to have your wood for your family's use to be under cover, and so connected with the house, that it can be got at from the kitchen without going out of doors. If your wood-house is of ample size, it will afford a place to do many little jobs in rainy weather, and your boys can split the wood under it, and pile it up on wet days. When I see a farmer's wood-pile at his kitchen-door, a lot of logs to be cut as the wood is wanted, and *green* at that, I know his entire character; and I might write it out thus: "This man was brought up from boyhood to be slack in his farm duties, doing nothing but what he could not well omit. He has no idea of there being any benefit in "driving things," and he takes the world "easy." He denies that there has been any progress made in farming since he was a boy; consequently, his farm, dwelling, and general surroundings have an ancient look, just as farms had fifty years ago: and his children are growing up to be "chips of the old block," and his boys will, probably, die as their father will, with a *pile of green wood at their doors.*

If a farmer has no other reason, why he should provide dry wood for his family, except that it is cheaper than green wood, as regards the heat given out, that alone ought to be a sufficient inducement for him to provide it; but the comfort of sitting by a dry wood fire in winter of itself ought to stimulate every farmer to have an ample-sized wood-house, filled with a year's supply of wood, and cut of the size suitable for use, for having to cut and split wood daily, as it is used, is a way of managing fuel that no good farmer should tolerate.

INCUBATORS.

Having received a description of "The Eclipse Self-Regulating Incubator" from its inventor, E. A. SAMUELS Waltham, Mass., I will give my opinion of it, as one of the oldest fowl-breeders of the United States. Over 30 years ago incubators were offered for sale in this county, their inventors claiming that they would hatch chickens cheaper than could be done by hens; and, of course, it was so demonstrated *on paper*. I have closely watched their success since 1815, and have failed to hear of but one case as being a success, out of their inventor's hands, and that was where many thousand dollars were invested in the business.

It may be said, "perhaps your information on this subject is limited, and that there may be many in use, a notice of which has not come under your observation." To which I reply, that for thirty years I have received from twenty to thirty of the leading agricultural and poultry papers; and I claim that if incubators are a success anywhere, I ought to know it.

Now, these incubators can be made to hatch eggs, when in a room heated somewhat by a stove in cold weather; and by devoting *time enough* to attending to them; but the objection is "it costs too much to run them." The changes in our climate are too great and sudden, I think, to render incubators profitable. In Egypt, where the thermometer stands at about 80° the whole year, with no rain, it is easy to hatch chickens, as is done, by the million, and they will live without any special care; but here we may have an incubator in operation at night, in March or April, with the thermometer out of doors at 50°, and in the morning, perhaps, down to zero! Thus when the chickens are hatched, it is not possible to rear them with as good success under "artificial mothers," as under hens.

A young man came to me last winter to ask my advice, as to buying an incubator. I told him that he had better trust to hens to hatch his chickens; but, like hundreds of such young men who think they know a good deal more than they really do, he bought one for some $60, and after a fair trial, he was so disgusted with

its use, that he gave up breeding poultry by all "patent" processes; and he is to-day a sadder, but a wiser man.

FEED STOCK REGULARLY.

All kinds of live-stock should be fed regularly—that is, at certain hours, and about the same quantity daily, not more than they can eat, but just what they need to be kept in good condition. If you feed your cows roots, or meal, with their other feed, let the quantity of each be about the same daily, not a liberal feeding for a few days, and then a half allowance for a while, as that is expensive feeding, because no stock can thrive by it, and especially milch cows. Many farmers seem to think that their young stock can "get along" on the poorest feed they have, and on very little of that. No, gentlemen, that is a mistake, as first-class animals can never be made of half-starved yearlings.

WHIMS AND FACTS.

GEORGE GARDNER.

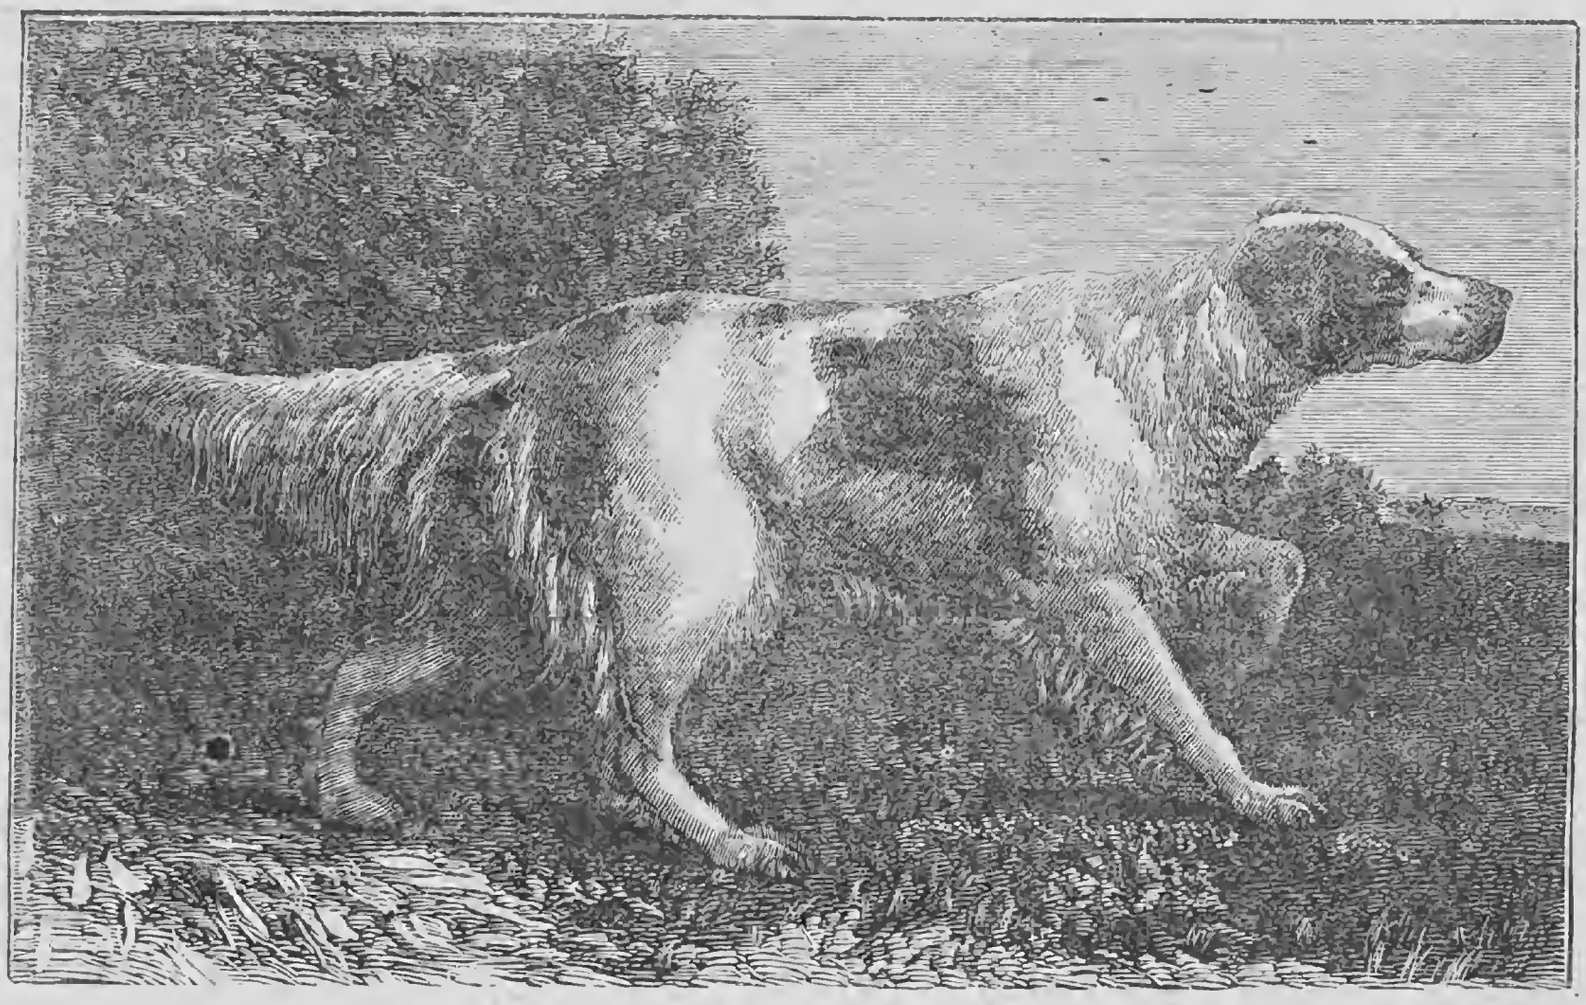
PUMPKIN SEED FOR COWS.

What an ignorant creature I have been not to know that moonshine was worse than the sunshine, yet I really did not know anything on the subject till Mr. Folsom said so in his communication under the above heading. I will give up on this point for the present, for I never proved it, though I may do so next summer by dividing into equal parts a quantity of fish, and putting one part in the moonshine all night and the other in the sunshine all day, and if the latter is sweeter than the former, that will be a pretty good proof of the truth of this lunar or lunatic doctrine.

Now about pumpkin seed: I have repeatedly proved that they are harmless. The first time was about 15 years ago on a farm in Maryland, which was owned by Jerome Bonaparte. I had so many pumpkins among the corn that I sold them by the load for a dollar per horse hauling them away, so that a four-horse load was sold for $4. They commenced ripening very early and, of course, I fed them freely to every thing. Our grass was short and burned up, and the cows (12) had fallen to make but 28 pounds of butter in a week, some of them having been milked above a year. I commenced giving them half a bushel per cow at milking time, and sawed some flour barrels in two, and placed them around the yard so that every cow might eat alone. The butter rose to 50 pounds per week, and then as the pumpkins began to rot in the field I filled every half barrel right up, which was about five pecks, or at any rate, a bushel heaped up, and the butter increased to upward of 60 pounds. At that time, although I had been from England six years, I did not know the seed was objectionable, but in fairness to Mr. Folsom, I state that I noticed the old boss cow in the yard, which would go around after the other cows had nearly done eating, and would lick the bottoms all clean, thus getting a great deal more than her share of the seed, was voiding a great deal of liquid, but at that time I did not know that this was due to the seed. I supposed it was caused by her greediness in eating so much more than her share of pumpkins, but I distinctly affirm the cow gave more milk than any other in the yard, save one, and she had not had a calf but was milked on from the preceding year.

Now, again, as I wish to tell the truth in every way: I noticed the fowls eat a great quantity of the seed which was scattered about where the pumpkins were chopped, and in the yard where the cows had failed to lick them all up, and several were affected by losing the use of their legs and lay fluttering about the premises. We then fed the fowls well with corn and grain and, excepting one or two which died, the sick ones recovered the use of their limbs, and the small quantity they eat did not hurt them. A few years after, I had charge of a Short-Horn herd, and the proprietor was shocked one day on seeing the seeds among the chopped pumpkins. The Hon. Gentleman listened to what I said and proposed a trial of a week without the seed, and there was no difference whatever in the milk or butter or in the cattle. As there was no perceptible injury or benefit, I am therefore justified in saying "I have proved the seeds do no harm &c." At another period of my experience in the United States, I was in Western New York, in Alleghany Co., and I had some seed saved (about a bushel and a half,) and after it was dried in the sun it was put in the tool house and I found some boys who brought their fathers' dinners had daily been eating the seed, and in two or three months nearly a bushel had been taken.

I have just mentioned it to one of my sons who recollects the occurrence clearly, and says he eat some too, also his brother, but as there were only five boys altogether, and some days not so many, they must have pocketed and eaten half a pint at a time or more among them; he says they eat them as if they had been almonds.



NATIVE ENGLISH SETTER, "LARK."—(See opposite page.)

If this is not sufficient, I can bring the man who is now attending to the cows on this farm and he will testify that we gave our cows a wagon-load per day thrown in the fields, and that all through the months of last August, September, October and part of November we did not give any on a Sunday, and in consequence every Monday, we ran short of milk, excepting on two or three occasions when we put some in another field on Saturday so as to be ready on Sunday.

I do not wish to appear ill-natured nor do I desire to set myself up as knowing more than others, for I am ignorant on very many subjects. Mr. F. is right about the good effects of apples, for I have fed them extensively in Maryland for two years, when living six miles from Baltimore, but it does not do to let the cows have free access to orchards, for I did so and a very high wind blew a great many sour apples down, and the cows eat so many that three were downright sick, and in consequence gave less than a fourth of the milk usual for several days. This explains the cause of the error fallen into by some people, that apples dry cows. After this I was careful they did not gorge to satiation, and found fruit beneficial, like other good things.

I don't think I ever misrepresent in writing, for I never go to others for aught to write about, nor do I go to books, for the old ones will mislead as much as old sayings will. Look at the revelations made about hollow horn and tail diseases by intelligent veterinarians, and know that more animals are killed by stupid nostrums and meddling quack farmers than die a natural death. There are lots of men living at this moment who believe the moon in some stages will spoil meat, and they will not put it in pickle then, yet Chicago and other wholesale packing places keep steadily on, in spite of the moon, and it is no wonder, when I find that New England burned and drowned women for witches since the States were free, that I should give ill-natured flings at "kindred absurdities."

If this is not enough, I will next autumn place $100 in the hands of the Rural proprietors against a similar sum from Mr. F: that I will feed any herd of dairy cows with pumpkins and prove that the seeds in the quantity only as they grow in the pumpkins, will do no harm; in fact, I will prove all I say.

Now let all opinionated believers in such nonsense recollect that they are not alone in errors: for on several occasions I have told Americans how, fifty years ago, flaxseed used to be boiled to jelly and fed to cows and horses and they would fatten on it to a wonderful state of obesity, and when I told them the quantity given, they would declare that the amount I said was given to one animal, would kill six on account of its diuretic properties. Diuretic action is not hurtful, for young grass, &c., produce it too.

JOTTINGS FROM MY NOTE BOOK.

Dec. 26.

PROTECTION OF GRAPE VINES.

Several who have written on the subject of protection to grape vines in winter, recommend the use of hay, straw or litter for such purpose. This may do very well for localities where field mice are unknown, but where these pests prevail to any extent, all such substances are objectionable, inasmuch as they furnish just the material to invite them to make warm nests in such immediate proximity to the vines that injury to the latter becomes almost certain. Rarely, in my own experience, have I found it necessary to use any such material for winter covering for either vines or plants. My method is to lay the vines down, as close to the ground as possible, fasten them there with short stakes, driven across to keep them in place, and then protect them from the weather with a covering of loose boards. This I have found to be sufficient in this latitude (43° N.), and safer than any strawy material, and less laborious than covering with earth, which is sometimes recommended. It is not the freezing which injures the vines so much as the sudden and frequent thawings of the frozen wood. If the wood can be kept frozen all winter, no injury will be likely to ensue from the frost, if the vines have been properly laid down. Many persons have an idea that the vines should be especially protected on the north and west sides, while I have found it more important to shield the southerly side from the rays of the sun, in winter, and if the quantity of proper covering material is limited, would be sure to apply it to the southerly side first. No ordinary amount of covering will prevent the vines from freezing in extremely cold weather. My object, therefore, is to *keep* them frozen, or rather to prevent their thawing on a bright, sunny day, to be suddenly frozen again at night. It is well to place the boards on both sides of the vines, inclining towards each other, so as to form something like an inverted V over them, leaving sufficient space at the top, however, for proper ventilation. By adopting this method I have uniformly succeeded in having my grape vines come out fresh and vigorous in the spring, if they are not uncovered before the hard frosts are over. Better leave them down till the buds are considerably swollen. There is an advantage, here, in laying down and protecting every kind of grape worthy of cultivation, however hardy it may be. The growth will be much more vigorous when the proper season arrives, and it commences earlier, thus insuring a more abundant yield of fruit, with an earlier ripening, which, in our northern climate, is an important consideration.

THE "MODEL FARM PREMISES."

The plan for the model farm premises, exhibited in the Rural of Dec. 22, is a decided improvement on the plans of a great majority of the farm premises which we see in passing through almost any portion of the country. Too many of them seem to have been arranged without any plan. But where there is evidently a plan, there is such a diversity of taste exhibited in that, as in many other matters, that a great difference is apparent.

As you do not seem to anticipate that the plan with which you have favored your readers will please all, I trust you will permit me to suggest some alterations in it, which may possibly be of benefit to the novice who contemplates arranging or re-arranging his farm premises. Taking the plan given to your readers, which contains many good points, I would, first, recommend breaking the immediate connection between the house and the barn building, by removing a portion, at least, of those on the two sides of the area between the house and barn. One reason for doing this any insurance agent would be very likely to suggest. Another is, that where the yard in the rear of the house is common for so many purposes as this apparently must be, it is impossible to keep it in that condition of neatness which is desirable in every yard appertaining to the homestead. This could be obviated by removing some of the buildings elsewhere, and filling a portion of the area with shrubbery, or, as you suggest, occupying it as a kitchen garden.

2d. There appears to be no mode of access to the barn with loads of hay, grain or other bulky produce, except by using the drive-way at the south end of the house. It is always objectionable to have much of such loading pass so near the house, on account of the litter and other unavoidable annoyances. It is evident that it is not intended to have such loads pass through the wagon house, C. An improvement would be to have an entrance into the barn from the road in the rear. This could be effected by moving the tank, T, to one side, and making a drive-way between the manure pits, Q and R.

3d. The location of the milk-room is bad, it being in the southwest corner of the house, directly exposed on two sides to the full force of the sun's rays in the hottest part of the day; whereas, it is always advisable to give the milk room a cool location for summer use. Then, again, it is a well-established fact that no substances are more liable to absorb and retain offensive odors than milk and its products, butter and cheese. For this reason the poultry houses and yards are too near it, to say nothing of the sheep-yards, M and N. A decided improvement could be made by reversing the positions of the bedroom, I, and the milk-room, L. This, however, would involve the necessity of changing the location of the water closets from that given in the plan.

4th. I see no advantage in placing the house cistern out of doors. I would have it in the cellar, devoting the kitchen cellar, B, to that use. This would bring it directly under the scullery, N, where it is most needed, and it would always be secure from frost. This change would also allow of the well being nearer the kitchen, instead of being sixty feet away, as in the plan. A place for the kitchen cellar could be found elsewhere, even if one of the *two* cider cellars had to be dispensed with.

5th. One reason for a change of place for the well would be to have it further from the drain-pipes, V, V, leading from the house and privies to the barn tank. As placed, they pass quite too near the well. If we can be absolutely certain that there will never be any leakage from the pipes that can gain access to the well, then, perhaps, their close proximity may be permissible. But who can say, with any certainty, that there never will be any undiscovered leakage—unsuspected, perhaps, till the family or some of its members are taken down with typhoid or other malignant fevers, caused by the use of contaminated well water? All such dangers should be most carefully guarded against.

Finally, I notice it is stated that the whole premises are supposed to be "situated on a slope, inclining towards the south." Now, as the house is also supposed to be situated on the east side of the plot, it would seem most important that there should be a good slope to the *west*, to give a good flow and free passage through the drain-pipes from the house, &c., to the tank in the rear of the barn, some 150 feet or more away.

Clinton.

A WARM STABLE.

S. RUFUS MASON.

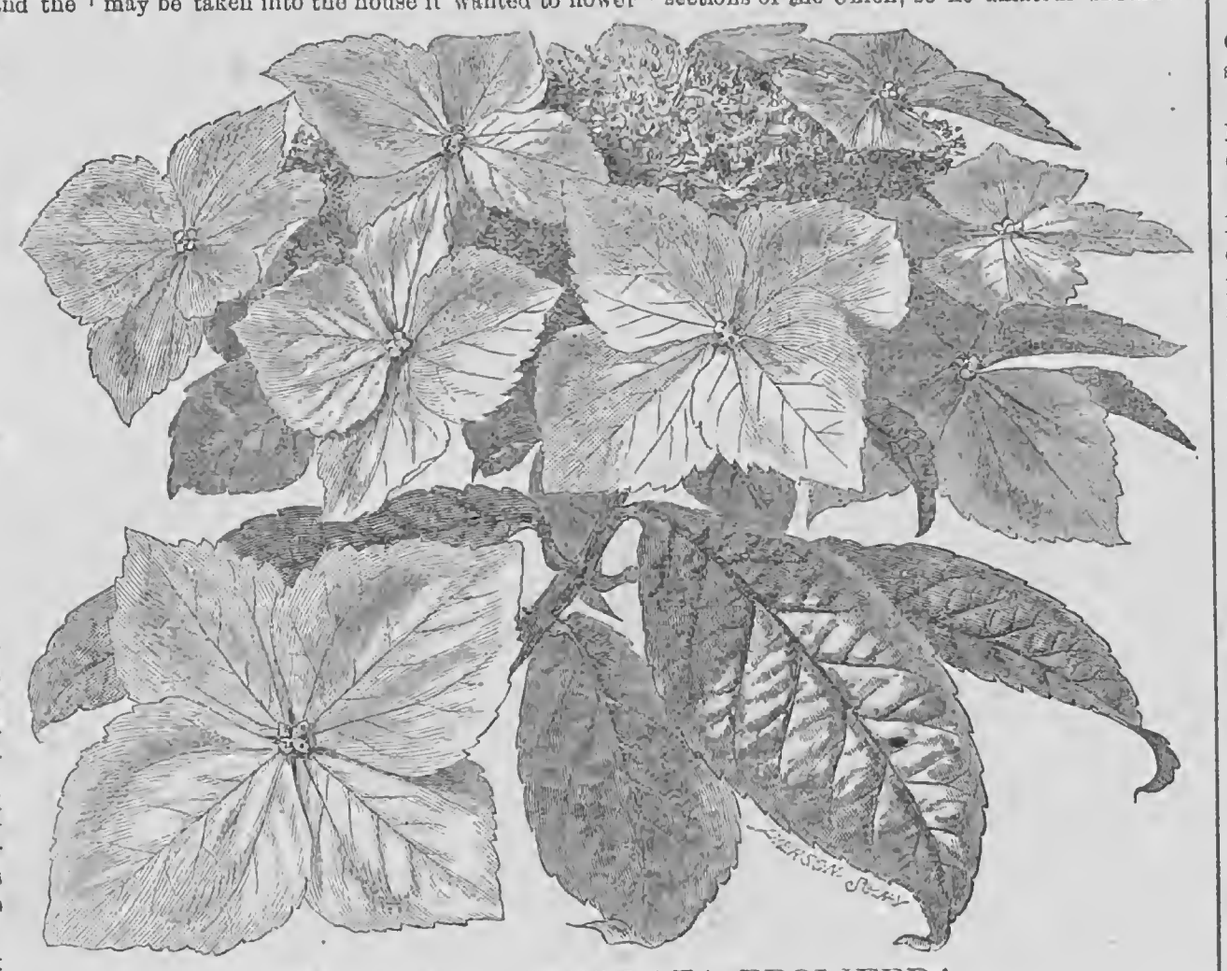
It is probably not known to the majority of your Eastern readers, that Nebraska is entirely under the control of "Rude Boreas,—blustering railer." We have winds of every possible character here, from the gentlest zephyr to the most terrific hurricanes. Our summer winds

in these flat, treeless prairies, are as necessary as bread and meat to enable us to sustain life. A dead calm day in July or August, with a clear sky, would drive every man and beast to shelter, while our winter winds, with the snows as fine as flour sifting through every pin hole, and filling houses and especially stables to suffocation, are a wonder to all new settlers. A warm, tight stable is a *sine-qua-non*. One made of boards is as open as a sieve, and about as warm, as the summer heat shrinks the stuff, and the extreme cold of winter keeps it there. So the inventive genius is brought into play. We set a row of posts in the ground so as to inclose the space required; set another row four feet outside of them, nail on, inside and out, some narrow boards, just so as to hold in the straw, and after putting on for a roof a lot of straight willows, fill in the crib-work with straw packed down close, and cap the whole with a straw roof, say eight feet high at the peak. If this is well done, and windows made on the south side, we have a very warm stable. Not the highest wind ever known here can get in, and it is perfectly warm and from the nature of the straw, not close nor confined like a wooden building.

LATE PIGS.

Pigs coming after the 1st of July unless particularly cared for, are stunted by the cold of winter. By having the shelter very warm, as cold weather comes on, by the most succulent food, especial care in cleanliness, and some little petting, late pigs may be made, as I am now demonstrating daily, equally as forward as those born in April or May. In fact I can see no difference considering the respective ages, between those of March and those of September, but it is due to both breed and care.

I have a long bodied breed of black hogs, which, under my mode of feeding and shelter, do great credit to themselves as well as to me.



HYDRANGEA STELLATA PROLIFERA.

Floricultural.

WINDOW PLANTS.

WILLIAM FALCONER.

You cannot give window plants too much light or sun during this month. Early in the morning they enjoy a sprinkling overhead so that they may dry before the sun gets hot, or they may be sprinkled about two or three in the afternoon, when the sun's heat is on the decline and so that they may be dry before night. Don't sprinkle water on blossoms else they will spot, rot, and quickly vanish. Give lots of water to Carnations, growing Roses, Calla Lilies, Bouvardias, Smilax and other fast growing plants that are in bloom, and if the pots have become well-filled with roots and the soil seems exhausted apply a mulching of thoroughly decayed manure. Weak manure-water is an excellent stimulant, but must be applied cautiously as too much or too strong is ruinous. Guano-water is first-class if judiciously applied, but I would advise amateurs not to trifle with artificial manures unless they know what they are doing. Calceolarias and Cinerarias require the coolest treatment, and are better kept in pits or frames that are well-covered up at night than in the house, so long as frost does not reach them. They like good feeding, and daily syringing, and as they are liable to green-fly, should be looked after in that direction. Cyclamens like warmish quarters and a place close to the glass. Crassulas are very pretty and effective window plants, and they last a long time in bloom, and submit with impunity to any amount of "kicking about." C. lactea, quadrifida and rosularis are now at their best. Nierembergias are budding thickly. Artillery plants are multiplying their guns, and zonal Pelargoniums are promising a famous display. Among other window plants now in full beauty are Libonia floribunda, Chinese Primroses, Cotyledons (Echeverias), Cape Heaths, Epacrises, Roinwardtia trygina, Mignonette, Peperomia, Sweet Daphne, Catalonian Jessamine, Fuchsia arboroscens, Polygala grandiflora, Manettia micans, Rondeletia anomale, etc. India-rubber plants and Dracænas look fresher and are healthier for having their leaves sponged over now and again.

THE CELLAR.

Leave Fuchsias and Lemon-scented Verbenas undisturbed. Look over Dahlia and Caladium roots to cut out any decaying pieces, and rub over the wounds with powdered charcoal to check farther rotting. Keep Century plants, Opuntias and other cactuses in the driest and lightest part; keep them cool and dry, but never admit frost. Immediately on appearance cut out decaying spots for they spread alarmingly. If you have Crocuses, Squills, Hyacinths, or other spring-blooming bulbs potted and bedded in earth, sawdust, sand, or ashes, take out a few of the more advanced and best rooted, and promote them to the window or green-house, gradually inuring them to the light, and in this way keep up a succession. Rhododendrons, Euonymuses, Laurels, Camellias, Oleanders, etc., leave undisturbed, beyond giving them all the light available. The earliest blooming Azaleas may be taken into the house if wanted to flower soon, and a few Deutzias or Lilacs if established in pots can be hastened into bloom if transposed to warmer quarters and sprinkled over head twice a day.

FRAMES.

These should be uncovered every fine day, and in the event of snowy or rainy weather the sashes or shutters instead of being removed had better be tilted up. Over the almost hardy herbaceous plants we winter in frames, we scatter thinly, some rough salt hay, or leaves, so that if the ground in the frames does get frozen, the plants will be protected from a hasty thaw. It is better to uncover early in the morning and shut up early in the afternoon, than let the sun shine on the shutters and set on the plants. Violent thaws and much wet are destructive to frame-plants.

INSECTS.

Wage war on these pests and they will be less troublesome in coming months. Fumigating, dipping in tobacco water, or sprinkling with tobacco powder are destructive to green-fly and young thrips; but if there be only a few plants to clean, wash them with soap and water and a sponge; it is the safest plan. With a sponge and small hair brush erase mealy bugs. The plants infested with red spider should be sponged twice a week till the insects are assuredly eradicated. Kill every wood-louse found about the pots, and show no mercy to worms.

POTTING PLANTS.

Unless you have exceptional quarters for your plants, as a warm, close green-house, don't repot during January. If any accident like pot-breaking occurs, or the roots be washed bare of soil, or the soil in the pots has become so sodden and the drainage so clogged as to prevent the ready escape of water, then repotting may be advisable, and if it should, use the smallest possible pots—that is just no larger than can hold the roots—and poor rather than rich soil. In stoves and warm green-houses, gardeners can repot and grow on young and soft-wooded plants during winter as well as summer, but amateurs do these things with risk.

Botanic Gardens, Mass.

BULBS FOR THE FLOWER GARDEN.

W. C. L. DREW.

COLCHICUM.

One of the bulbous plants interesting to the young amateur, is the curious and attractive flower botanically called Colchicum, and commonly known as Autumn Crocus.

This plant has the singular habit of producing its several parts at intervals of about some six months. The leaves appear in the early spring with those of the Tulip and Snowdrop, and in the following autumn we have the Crocus-like flowers in full perfection, but not until the next mid-summer do we find the seed-pods. This peculiar freak makes the plant one of the most singular and attractive to the amateur, professional florist, or botanist.

Each of the bulbs, which in flowering specimens are large, produces from six to a dozen blossoms. It will flower very freely in any situation, so that it may be taken up in the autumn before flowering, and planted in a pot or other convenient receptacle, so as to flower in the house; and so persistent is it in its intent to flower, that even the most indifferent amateur may have no fear of staying its bloom by such a removal. The bulbs are, I believe, hardy in all sections of the Union, so no amateur should be deterred on this account from trying a few, at least, of these curious bulbs.

In the United States there are only two varieties in general cultivation—C. autumnale, also known as C. maximum, which bears blossoms of a delicate pink color, and C. Agrippinæ, of a deep rose-color, checked with a lighter shade. There are, however, four other equally good varieties, viz.,—C. autumnale album, a pure white; C. autumnale plenum, a variegated variety; C. autumnale purpureum striatum, which I have never seen, but judging from the name, would say was a handsome purple, variegated with some other color; and C. veratrifolium, another variety I know but little about. The Colchicum will grow in any light loam.

El Dorado, Cal.

DAPHNE INDICA.

At Bennett's Nurseries at Flatbush, Long Island, one of the most noticeable features at present is the many large and flourishing shrubs of Daphne Indica now loaded with the most deliciously fragrant flowers. These shrubs are planted out in the bed of the camellia house, and grow most robustly. They remain in bloom for many weeks, and there are varieties with reddish purple and white flowers. These shrubs have thick, shining, evergreen leaves, and are of the easiest possible culture, merely requiring protection from frost in winter, and a very little shade in summer, a porous soil, and plenty of water at all seasons. They certainly thrive best when planted in a conservatory border, but are, nevertheless, very applicable as pot-grown plants, as hundreds of little fellows on a side-bench at the above nurseries can testify. Every little plant—from three inches high and upwards, and from those in thumb-pots onwards—have as many flower-heads as they have branches and branchlets, and when there is only one shoot, as in the case of the smallest specimens, that is terminated by a flower-head. These Daphnes blooming in winter,—at a season when flowers are doubly valuable, and lasting in beauty so long—commend themselves to more general cultivation.

CATALOGUES, &c., RECEIVED.

Among novelties in Mr. Peter Henderson's Catalogue, not yet published, will be Hydrangea stellata prolifera, of which a fine engraving will be found upon this page. Of the new white Hydrangea "Thomas Hogg," to which we have often referred, Mr. H. will furnish a colored plate, though a white flower is not the easiest to portray in colors. H. stellata prolifera has flowers (bracts) of a deep pink color. Though of the Japonica class, Mr. Henderson says it is hardy and quite distinct.

Garden Manual. J. B. Root, Rockford, Ill. This is made up of original articles from the pen of Mr. Root, and many gardeners testify to their practical value. Such topics as Storing Winter Vegetables—Drought and How to Meet it—Melons, &c., are treated. The Manual is free to applicants.

Catalogue No. 3. The Lawson Co.'s List of Seedling Forest Trees, deciduous and evergreen. London, Eng.

Report. Thirty-sixth Annual of the Transactions of the Queen's County Ag. Society, Mineola, Long Island, N. Y.

Circular. The Mapes' Formula and Peruvian Guano Co., 158 Front St., N. Y. City.

Pamphlet. Benton Center Nurseries, Yates Co., N. Y. Apple trees four cts. each, at wholesale.

Circular. Eleventh Annual Meeting of the Northern Illinois Hort. Society, at Franklin Grove, Lee Co., Ill., Jan. 23–25.

L. Paillet, Chatenay-lez-Sceaux, near Paris, France. Fruit tree stocks, seedling forest and coniferous trees, seedling shrubs, climbing plants, Roses, Rhododendrons, Magnolias, Clematis, &c., &c.

M. Paillet remarks:—"Apples worked upon Doucin stock grow much more vigorously than on Paradise, but do not give fruit so soon. It (Doucin) is a very good stock for middling or bad soil, where it grows and fructifies as well as Paradise." Again, he remarks:—"The true Saint Julien Plum, from layer, is the best stock to make fine, straight, standard trees.

Vick's Illustrated Catalogue and Floral Guide for 1878, James Vick, Rochester, N. Y. If an inexperienced person wishes to order flower or vegetable seeds intelligently, we know of no more trustworthy guide than the above. Nearly every plant is elegantly and fairly shown in the 300 engravings presented and the cultural details are all that is needed.

Garden Guide, R. H. Shumway, Rockford, Ills., Illustrated list of vegetable and flower seeds for free distribution. Mr. S. says he will guarantee his seeds to be equal to any in America.

Botanical Index, L. C. Case, Richmond, Ind. New, rare, and beautiful plants.

We see Mr. Case offers Dracæna Goldieana, to which plant we called especial attention a few weeks ago.

We are indebted to Prof. Cyrus Thomas for a copy of his first Biennial Report as State Entomologist of Illinois, which seems to us to be of much practical value, as well to the ordinary farmer and horticulturist as to those who have made a study of entomology as a science. Scientific men, as a rule, seem to think very little of adapting their writings to the comprehension of the ordinary reader. The present work is an exception. Part Second begins: "As it is my desire to make this report a 'Manual of Economic Entomology for Illinois, and through it to familiarize the farmers and horticulturists of our State, as far as possible, with insects which destroy their crops, injure their fruit and ornamental trees, and infest their gardens, it is proper that I should first explain the terms used, and give in as plain and simple language as possible the character of the insect class of its larger sub-division."

The Sportsman.

NATIVE ENGLISH SETTER.

(See Illustration on opposite page.)

Many of our readers are interested in high-bred hunting dogs as well as in high-bred cattle.

We have always thought that, aside from hunting purposes, farmers might just as well support beautiful and intelligent dogs as the ill-bred, troublesome, and ofttimes worthless animals so often seen. It costs no more to feed them and they are capable, through kindly discipline, of being made companions to the members of the household, faithful, loving discriminating, and intelligent. In our issue of Aug. 18 were presented portraits of "Jerry" and "Tepper" with some account of their pedigree. We now present an excellent sketch of the native English Setter, "Lark," who was bred in November 1874 by Mr. Brooks' Phil. out of Mr. Raymond's "Dido," both ancestors being fine field performers. He is orange and white with black nose and eyes. He won first prize at the New York Bench show in a class of over sixty of the finest English setters in the country. The Forest and Stream says "Lark," though not coming in direct competition has beaten the best imported dogs in the country, as he beat both "Nip" and "Tuck" who beat "Paris" and "Leicester." At Philadelphia, he won the first prize in the champion class and a special prize offered for the best setter in the show, thus being pitted against some forty prize winners both native and imported, Irish, Gordons &c. As a sire he has never failed to stamp his progeny with many of his best points. Our engraving is from an oil painting.

Domestic Economy.

CONDUCTED BY EMILY MAPLE

SIFTINGS FROM THE KITCHEN FIRE.

MRS. ANNIE L. JACK.

It is one of the problems of domestic economy in hearth and home consultation, "How can we save time?" and yet we go on, wasting the precious hours over things of little moment, and neglect more important duties or pleasures. I often hear ladies say in the short days of winter, "It seems as if we do nothing but cook, the days are so short!" and yet they make no effort to change the order of things. My own household is regulated by the fact that five hours of the day are spent in the schoolroom, where I am teacher to the merry group; and in the intermission at noon, we take lunch—as the children would do if they attended the district-school. This, if practiced in many houses where the children come home at four in the afternoon, would leave a whole day for the duties of the household, and the united family could enjoy a five o'clock dinner to the gratification of the children, whose plate "kept over" is often a burnt and tasteless reminder of the dinner they have missed.

In the matter of cooking, too, I am often struck with the fact that women, in their housewife's pride, spend too much energy on their preparations for a company tea, in rural places. How many of us have hardly found time to sip our tea, between eating our bread and butter, for the added duty of *passing cake* to our neighbors! Not long ago, taking tea at the house of a very near and dear friend, I was called upon to sympathize with her for the misfortune of having "no time to read." The secret was revealed to me when I found myself afterwards passing around to those whose plates were already laden with good things—nine kinds of cake, all homemade. What skill, what energy, what time such a work required! How toothsome each delicate morsel! what an amount of labor expended! Reader, I like cake, but I should feel it the dryest of sawdust if it robbed me of my time for mental improvement. With all the other condiments, no sensible person needs such a choice of cake, and I feel as if I were considered a gourmand when I find it displayed before me. The simple elegance of a tea-table is not in overloading, but in the bright, cheery, well-kept furnishings, with a full supply of whatever dainty dish is set before us.

Speaking of domestic economy in regard to time, I am often called upon to notice the prejudice against labor-saving machines for *women*, that prevails among farmers who procure (and rightly, too,) everything to aid farm work. How many of you can claim as your kitchen aids, a washer and wringer, a clothes sprinkler and mangle, apple parer and corer, potato peeler and slicer, syllabub churn and raisin stoner, a first-class egg beator and carpet sweeper? And yet all these things would not cost as much as the threshing machine so necessary to a farmer who does not like to be considered behind the times. We too often work on in the primitive way, using our old implements, as the farmer might his old flail. But is it economy when *time* is so precious?

Just as I think of changing the subject of my "siftings," one of the crowd comes in with half a dozen new-laid eggs, which he is eager for me to count. I make a rule, as eggs get scarce in winter, to give the children "an apple for an egg," and it is surprising how faithfully they are gathered and kept in count. As an article of diet we value them highly, and even fancy they taste better at this season of the year, when four times the price of the same article in summer. One of MARION HARLAND'S housekeepers is made to say:—"Give me a half a dozen eggs, a few spoonfuls of gravy and as much cream, a spoonful of butter and a handful of bread crumbs, and I can get up a good breakfast or luncheon." One of her tried dishes for these meals is so simple yet so palatable for a hurried time, that I cannot help quoting at closing:

Eggs Sur le Plat.

Six eggs; one tablespoonful of butter. Melt the butter in a shallow baking dish. Break the eggs carefully into it, dust with pepper and salt, and put in a moderate oven until the whites "set." Serve in the dish in which they are baked.

DOMESTIC RECIPES.

Coffee.

I always wash coffee before roasting it and those housewives who do not, would find it a great improvement to do so. Take as much coffee as can be conveniently browned in a kettle and pour boiling water over it. Drain the coffee in a colander, put into the kettle and set on the back of the stove to dry, stirring occasionally.

When dry, set over a brisk fire and stir constantly. It browns evener to add a tablespoonful of butter just as it begins to color. Care and skill are required to keep it from burning. When quite brown try a little in the mill and if it grinds easily and is of a beautiful brown, it is done. Remove from the fire and when *cool* stir in a fresh egg and let the dish remain where there is a gentle heat and the coffee is dry. This, I think, settles coffee as well as to use an egg—or part of one—every day and is less trouble. When I make coffee I grind a small teacupful and pour over it, perhaps, one pint of hot water. Set the coffee-pot where it will steep, but not boil, for twenty minutes, then fill up with as much boiling water as is needed and let it stand a few moments to settle before pouring out. "FARMER'S WIFE."

Orange Marmalade.

Allow equal weights of oranges and white sugar; peel and quarter the oranges—careful to remove the inner thick skin from the yellow peel. Boil the peel in clear water changing the water once, about fifteen minutes after it first boils, to remove the bitter taste. When tender, I boil it slowly for three or four hours, drain in a colander and cut into delicate shreds with a very sharp knife. To prepare the pulp, remove the seeds and white stringy outside part; squeeze out the juice and thin pulp into a bowl and pour over the sugar; cover the pulp with water and boil until tender; then pound the pulp in a mortar, or cut into small bits, and with the water in which they were boiled add, with the shreded yellow peel, to the sugar and juice. Put the whole into a porcelain kettle and boil. When it begins to thicken it must be tried occasionally by letting a little cool in a spoon upon ice. Great care must be taken that it does not burn. When as thick as desired, turn into cups or tumblers, cover with paper wet in brandy and tie down tightly.

Orange Fritters.

Take the peel and white skin from three or four oranges; cut them across into slices; pick out the seeds and dip each slice of orange into a thick batter. Fry until nicely browned and serve upon a napkin with powdered sugar sifted over each slice.

Orange Tartletts.

Remove the pulp from two or three oranges; boil the peels until very tender; beat them to a paste with twice their weight of sugar; add the thin pulp and juice of the oranges with a tablespoonful of butter and beat these ingredients together. Line some little pans with puff-paste; fill with the orange mixture and bake. E. M.

Carrot Ointment.

It is convenient, if not absolutely necessary, to have on hand a sure remedy for burns, flesh-wounds, chapped hands etc. This demand is supplied in many families by patent remedies, in ours by Carrot Ointment made as follows: To one medium sized carrot, well washed and thinly sliced, allow one-fourth pound of freshly churned, unsalted butter. Place them together in a spider or other iron vessel, simmer slowly until the carrot is crisp and brown—taking care not to burn it, then strain through a thin cloth and keep in a tin box or wide-mouthed bottle. As a healer it has few equals. A few applications will cure the worst cases of chapped or cracked hands, provided the hands are well washed with Castile soap and soft water, and well dried, just previous to its application. After applying the ointment rub the hands, warming and rubbing until all is absorbed. It will speedily heal burns after the fire is extracted. Indeed, we use it in all cases where a healing agent is needed.

Molasses Cookies.

One cup of molasses; one cup of sugar; one cup of lard, or butter—if butter is used the cup must be heaped; one cup of luke-warm water in which one large teaspoonful of salaratus is dissolved; one teaspoonful of cloves and one small nutmeg. Cream the sugar and shortening; add the molasses, and spices; then one cup of flour, stirring it well in; then add the water, a little at a time, with flour to make it stiff as you can stir it. Roll one-fourth of an inch in thickness and bake in a quick oven to a light brown. These are nice and moist.

Hygienic Information.

SIMPLE CURES.

S. B. PECK.

An advertisement in a New York paper lately brought to my mind many cases that had been related to me of remarkable cures by very simple remedies, some of which were taken stealthily without the knowledge, or against the protest of the attendant or nurse, but always gratifying to the palate of the patient. The first I shall relate occurred long ago when cold water was not allowed in fevers. The patient had a person "to watch with him," who was directed to put hot stones to his feet to promote perspiration, but was not to allow him water to drink, "for that would counteract the good effect of the heating process." These stones were heated in the fire and partially cooled in a pail of water kept under the bed. The watcher went to sleep, and the willful patient, regardless of consequences, managed to crawl out of bed and without goblet or cup, drank slyly his fill from the pail, got back to bed and quietly slept himself into a profuse sweat, after which he rapidly recovered. A man sick unto death and nearly given up by his physician, was called on by the latter in the morning, who expressed himself highly pleased with the good effect of the medicine he had left, and congratulated him on his appearing much better. "Yes" said the patient "I have been much better since I drank that stuff in the cupboard." The stuff he had covertly drank turned out to be vinegar from a pickle jar! A little girl whose disease baffled the skill of the family physician, and who grew worse in spite of all his skill was called on by him as the family were sitting down to breakfast, and as the mother was coming to the table with a plate of pickled cucumbers, the child, lying in a crib near by, uttered a shriek which called the mother to her side with the plate of pickles in her hand, from which the child snatched a pickle and ate it before the mother could take it from her—sequel, the child recovered rapidly.

Now I do not think much of cucumbers any way, and never eat them either as medicine, food or condiment, but I do believe in acids when the appetite craves them. I ought not to slander this vegetable, for I used to eat them and they never hurt me, but set gratefully on my stomach. They were fresh from the garden. Now I prefer as a matter of taste the more luscious fruits.

I will relate but one more case of singular cure, though there are others on my mind. This was related to me by Dr. STRONG, an old physician of Hartford, Conn., some fifty years ago, as an occurrence in his practice. A little girl was pining, moaning and shrinking away in flesh, without any other symptoms of disease, when he was sent for. The case perplexed him and he asked the mother if the child had been denied any food or other thing that she seemed to long for. She reluctantly admitted that the child had asked for tobacco. A small quantity was given her which she ate greedily, from which date her recovery was rapid. For the rationale of the case I can only surmise that she had tasted the weed before, and if it then produced nausea and now satisfied her craving, it was not the first case of the kind. Physicians owe much to accidental discoveries, and it is wise and humane in them to note these peculiar cases, not presuming that in all, or even a majority of subjects, the same treatment of apparently similar ailments will produce similar effects. The stomach and all the viscera being beyond our sight, and much of them affected by all that is introduced to them, the causes of many internal ailments, and the effect of food and medicine upon them, will doubtless ever remain mysterious.

Everywhere.

NOTES FROM NORTH CAROLINA.

WARREN CO., N. C., Dec. 31.

We are just now feeding sowed corn fodder and it comes out so sweet and bright and the stock eat it with such a relish that our plan of curing it had as well be told now.

Having tried nearly, or quite, all the ways recommended, I have settled in my own mind that the most important item is, plant early; the object being that the cutting may be done early while we have plenty of sunshine. Twenty years ago the sowing of corn for fodder was delayed until corn planting, road mending, sheep shearing, &c., were done, under the plea that it was just as well late as early, as nothing but stalks was expected. The results were either a lot of half cured, moldy, and half rotten fodder in the mow or stack, or else badly weather beaten in stooks to be hauled as necessity required, only to be eaten under protest by hungry animals. As to varieties, I have been able to see but little difference, but prefer to use such as are adapted to the climate; small, early for the short seasons of the north, larger and later as we go south. Having the land plowed and harrowed with a light, one-horse plow, run off the rows two and one half feet apart, drop the seed about fifteen to each foot, cover by harrowing crosswise or with a cultivator lengthwise, taking out the front tooth, twice in a row with cultivator and again with the plow when 18 inches high, turning the furrows to the corn is all the cultivation necessary; cut when in bloom, leaving it thinly on the ground for two or three days of good weather, then bind in small bundles, not more than five inches in diameter, put up in round stooks of eight or ten bundles, or long shocks after.

I see by your correspondence from "Everywhere" that this has been an autumn and winter so far, remarkable for the mildness of the weather. Down here in Carolina we have had a delightfully warm, dry and pleasant last half of December until yesterday, when we were visited by a heavy rain, and now the soil is thoroughly saturated, roads soft, wind strong from the north, and we are expecting a cold snap. Business has been brisk, as is usual while cotton is on the market and our merchants are rapidly selling large stocks of goods. When this is over then will come a lull until May and June when tobacco comes into market.

A larger area of wheat was sown this year than for many years before; the open weather has given it a fine start. For money we depend mainly on cotton and tobacco, which is all wrong. The farmer, either North or South, should so manage his business that something of his production is ready for market every week in the year. Things look more hopeful in this respect as, year by year, more grain, clover, roots, fruit, cattle, sheep, swine and poultry are grown, and when the present order is reversed and we rear more pigs than puppies, and more lambs than either, we will feel that we are better prepared to compare notes with our brother farmers of the frozen North. M. B. PRINCE.

RURAL SPECIAL REPORTS.

SAVANNAH, N. Y., Dec. 21, 1877.

We have had but little freezing weather yet, and if we did not consult the almanac frequently, we should believe it to be October now. The people who went in debt for farms before the price of land fell, are feeling rather blue now, as it is hard paying for them with produce at the present low prices. If the price of farm labor was reduced in proportion to other things, the trouble would be considerably less; but the majority of laborers are trying hard to keep very near the war prices, not considering that one dollar will go as far towards supporting them now as three would then. The clover seed and apple crops were almost a failure in this section. By waging a continual warfare with the beetles, a fair crop of potatoes was secured—price, 35c. per bushel; barley mostly sold for 60c. per bushel. Oats a good crop, but no paying market for them yet. The best price for wheat has been $1.40; pork, $5 per 100. C. S.

ST. CHARLES CO., MO., Dec. 30, 1877.

The extremes in temperature for the month of December up to date, at 6.30 A. M., have been from 17° to 55°. The first half of the month was very pleasant, giving the farmers an opportunity to finish husking and plowing; during the last half, there has been but very little fair weather; I think but two days; rainy or drizzly all the time, with this exception. The roads are almost impassable, on account of mud. Cows are not doing well for two reasons—bad weather and irregularity of feeding. We could not get the grain to mill to grind for them. This County being almost exclusively used for dairying, the condition of the roads has nothing to do with exporting grain, there being more shipped in than out. This evening the mercury has just touched freezing point, and we are now likely to have a change for the better, as it is clear overhead. J. B. T. W.

MUSKEGON, Mich., Dec. 24.

"'Twas the night before Christmas" still raining! This is the 10th or 11th day of this cloudy, foggy, warm weather with scarcely a frost and no ice or snow. I think there have been, at least, 20 days of successive fall or summer weather. Swamps are full and running over, lumbermen and loggers look blue. How much more of this? Has the clerk of the weather made a mistake? Hope he won't give us sleighing next July. Mercury at 50 at 9 P. M. Dec. 25, Mercury at 48 at 7 P. M., hope rises as mercury sinks. S. B. P.

SNOHOMISH CITY, W. T., Dec. 24, 1878.

We are having lots of rain, but it is warm in the garden. It is nothing uncommon to see roses in full bloom. Hay is low—worth $9@10, and not much sale at that price; potatoes, 50c.; wheat, $1.25; oats, 65c.; barley, 70c.; beef by the quarter, 4½@5½c.; work oxen, $125@175. Times are hard at present, but will be better soon. Logs are selling now at $5@5.50 per M. HARPER.

WESTMORELAND CO., Pa., Jan. 1, 1878.

We have up to this date had no winter here, but very warm weather. The winter wheat looks extra nice, and a large amount of acres, have been sown; it was somewhat injured in the fall by the fly. Last year's crop was only a mod-

erate one; it is now worth $1.25, and half or more gone to market. Corn was not very good; it is worth 40c.; oats, extra good, worth 25c.; pork, 4½c., and dull; cattle and all kinds of stock very low and hard to sell at any price.

D. H. WILLIAMS.

RURAL GROUNDS, Jan. 5.

THE ground, for the first time this season, is quite well frozen, and the Rural Lake skimmed over with ice. But the freezing during the two or three nights past, thaws before noon, and only serves to render the roads and walks slippery with mud. We have already said that this section of the country has never known so pleasant a summer and fall. It seems now as if winter might be added, to make the anomaly extend through three-quarters of the year.

OUTAGAMIE Co. Wis. Dec. 23, '77.

WE have had ten days, from the 18th to the 28th of Dec., without frost, and still it rains and is warm. Regular Florida weather up here in northern Wisconsin. The mud is awfully deep and farmers are obliged to abide under their own vine and fig tree, or rather roof tree.

E. NYE.

PRINCE WILLIAM Co., Va., Jan. 1, 1878.

WE have no cause to complain of the past season hereabouts. The weather has been fine for our stock. Young cattle, sheep, etc., are yet in grass and looking well, and we are still working out-of-doors, plowing, teaming, etc.

ED. KEYSER.

ELKHORN, Wis., Dec. 31, 1877.

No frosts for two weeks, but plenty of rain and mud.

A. D. H.

HUDSON, N. Y., Jan. 3.

FIRST severe cold weather in this region.

K.

The Apiarian.

WINTERING BEES.

T. B. MINER.

THE question in regard to extracting the honey from the central combs of hives in the fall, to allow the bees warmer clustering room, is being discussed in the papers somewhat. Mr. L. C. ROOT, in opposing an advocate of the negative side of the question in the Country Gentleman, says: "When the cluster is formed in cold weather, a bee occupies each cell within the given space, making the entire body of bees even smaller than if the combs did not pass through the cluster." From which he argues that there should be no honey in the combs where the bees cluster, and adds: "If they are obliged to cluster between combs filled with honey, in very cold weather, they will be sure to be found frozen. I have noticed bees so frozen in several hives this present month, even before severe cold weather."

There must be something wrong, I think, besides having sealed combs to cluster on, when bees freeze in November. I kept bees extensively before Mr. ROOT was born probably, and have continued to keep them till the present time; and this is the first case that I have ever heard of their dying in November from any cause excepting the *want of honey*. The following points, I claim, my experience has established:

1. That bees, when left to store honey as they please, generally leave the centers of combs where they cluster, unfilled with honey; but if sometimes they do store too much there from the fall supply, by the time they should go into winter quarters, they have consumed enough of that thus stored to enable them to winter safely, if they are otherwise in good condition.

2. That strong families of bees, if the queen is prolific, and has continued to breed freely up to November, as all should do, will winter safely, without the removal of any honey from the combs where the bees cluster.

3. That the bees *must* have a supply of honey on the same combs on which they cluster, or they will perish, if the weather be so cold that they cannot leave the cluster as often as once a week, or perhaps ten days.

3. That the removal of the honey in the central combs by an extractor in the fall, after the honey-harvest is passed, endangers the safety of the bees, unless they be wintered in a place so warm, that they can pass from one comb to another often enough to supply themselves with food.

But it is to be expected that apiarists will differ in their opinions on many questions pertaining to bees, as men do who are engaged in other pursuits; and I think I am safe in saying, that there is no man living who understands the nature and management of bees *perfectly*. That is, so perfectly that he can learn nothing more. The reason why there are so many different views and theories about it, that bee-keepers take it for granted, in many cases, that a thing is so because some noted apiarist has said it is so; and thereafter a hundred pens may be used to uphold a fallacy. Now, where is the record of any experiments made to test the claim that the extractor should be used to remove honey from combs to secure the bees wintering safely? Who has tried the two systems thoroughly, side by side, for a series of years, and given the result to the world? Nobody, as far as I can learn, but Mr. BETSINGER, whose statements Mr. ROOT opposes as grossly erroneous; and he (Mr. B.) says, that his bees that had honey extracted died, while those that had none extracted wintered safely. Mr. ROOT says that he believes his theory "corresponds with the opinion of every practical bee-keeper, unless it be Mr. BETSINGER." Now, suppose the question were put to "every" practical bee-keeper in the United States, Mr. ROOT would, undoubtedly, be surprised to find that nine in ten never *heard of such a question before*, as but a small portion of the bee-keepers of this country are readers of our journals; and, consequently, the most of them are not informed on what professional apiarists do or do not believe.

MY BEES AGAIN.

LAST year I wrote you about my bees. This year I report again. Last spring I had seven swarms, and sold two of them for $12. The other five swarms I hired a man, who knew more about bees than I did, to transfer into patent frame hives of his own invention, paying him $5 for his patent right, and for the hives which I used during the summer, amounting, in all, to $27. My five swarms increased to eleven, two of which I sold this fall for $12. Now the account stands thus:

CR.

By sale of 160 lbs. box honey, at 20 cts	$36 00
2 swarms bees sold, at $6	12 00
9 swarms bees on hand, at $6	54 00
	$102 00

DR.

To 5 swarms in the spring, worth $6	$30 00	
Transferring, patent right and hives	27 00	— 57 00
Balance profit		$45 00

Also:

DR.

To time and care ..... $——

CR.

By honey used in the family ..... $——

This, I think, would run the total product of honey up to about 250 lbs.

Our honey was extra good this year, being made in the early part of the season, from the white clover and basswood. My stocks are all strong and in good order this fall, and I still think it pays to keep bees.

JOHN RUSTICUS.

WIS., Dec., 1877.

The Naturalist.

INSECTIVOROUS BIRDS.

I NOTICED in a late RURAL, some interesting remarks on insectivorous birds, and it is claimed that while they may be destructive to insects, they also destroy many luxuries that almost every garden affords, such as strawberries, cherries, grapes, and other fruits; and the question at issue seems to be, whether the birds shall be destroyed, or allowed to monopolize the early fruits of the season. Birds are always welcome visitors. We listen for the first modest note of the bluebird to assure us that spring has come, and as the season advances, one songster after another mingles its notes and joins in the general chorus. The various tints of their plumage attract the eye, and their different habits are studies of interest to the close observer. All this is in favor of the birds, and should they take to their wings and leave us birdless, our fields and forests would lose much of their attraction.

Among the birds named as mischievous is the robin, and he seems to be guilty of the charges brought against him, for he is bold, saucy, voracious and persistent. He preys upon the choicest fruits of the season, and a fair trial of the robin for his misdemeanors would doubtless result in a verdict of banishment for life. It is true that we should miss his cheerful notes at early morn during the summer months, but a rich dish of strawberries or cherries would compensate for his absence, for he generally secures his own breakfast before he gives notice that he is stirring. I noticed, the present season, after I had gathered all my grapes except one vine of a small late kind, that the robins, after reconnoitering the garden and finding their occupation gone, sought out the ungathered vine and before I was aware of it, every grape had disappeared.

The writer includes the Oriole as one of the marauders that infest the garden; but he is more cautious and less aggressive, and has some redeeming qualities. His brilliant plumage, modest note and unassuming manners, are attractive qualities which reconcile us to the little mischief he is said to be guilty of, and he can make a meal of what the robins would discard. Of all the insectivorous birds, none have to my knowledge been reported that will devour the hairy caterpillar, to which there seems to be an instinctive aversion by both bird and fowl. Some years since, when caterpillars were plentiful, I observed from the window of the room I daily occupy, an oriole which seemed to be feeding upon something on an apple tree directly in front of the window, which caused me to take particular notice of his movements, and the process was as follows:—He first caught the worm, and placing his foot upon it, seized it by the head, and by a dexterous movement drew it from its coat-of-mail and swallowed the contents, leaving the hairy pelt upon the tree; this was repeated several times before he left the tree. If any of your correspondents has witnessed a similar operation, it would serve to strengthen the testimony in favor of the oriole. The birds should have a fair hearing before judgement is pronounced against them; and a close observation of their habits is the only means of coming to a just decision as to their respective merits.

A SUBSCRIBER.

Pomological.

THE GREAT LAKES AND FRUIT CULTURE.

T. T. LYON.

IN the continuation of our remarks on this subject, from page 322 of your last volume, we are not left to adduce the recent discovery of the capacity of our climate for the purpose, as the sole reason for so sudden and rapid a development of this interest here. Very much is doubtless due to the increasing importance of fresh fruits as an article of diet; and a still more potent cause may, beyond doubt, be sought in the unprecedently rapid settlement of the entire Northwest; with the simultaneous growing-up of large cities about these lakes, and throughout the entire region, with a great collecting and distributing mart at Chicago, where the teeming but perishable fruits of the eastern shore can be laid down at slight cost, and in the finest possible condition, to be taken up and distributed broadcast, over dozens of railways, and hundreds of miles of distance, among the millions of people who vainly seek for a local supply of the luscious wealth of Pomona, which the denizens of the "Fruit Belt" are thus opportunely enabled to tender them.

It should, however, by no means be assumed that Chicago is the only point of distribution for the production of the fruit region; since Milwaukee, and, indeed, each and all the business points along the western shore, contribute their energies to the purpose, in measure only limited by their facilities for the work.

St. Joseph and vicinity has been so long given to this work, that, despite the terrible calamity to the peach interest there, she still maintains a very decided preponderance in the amount of her shipments, over any other shipping point; and, especially so, so far as apples and the small fruits are concerned; although some other localities seem likely to become strong rivals, as rapidly as the difficulties arising from new lands and young, non-bearing orchards, will permit their development.

The following statistics will give some idea of the present extent and magnitude of this interest.

We learn from A. O. WINCHESTER, of St. Joseph, that the shipments of fruit through that port, during the summer and fall of 1877, coming from the northern and western portions of Berrien County, (doubtless including much from the fine fruit region of Van Buren County along the C. & M. L. S. R. R., which passes through St. Joseph), were as follows, viz:

Strawberries, in ½ bush. crates		128,340	or 257,680	pecks
Raspberries,	" "	40,771	81,542	"
Blackberries,	" "	14,876	29,752	"
Cherries,	" "	6,945	13,890	"
Grapes, in peck baskets			243,563	"
" ½ bush. cases		5,731	7,641	"
Quinces, in peck baskets			700	"
Peaches, " "			427,225	"
Apples, in barrels		73,882	664,938	"
			1,526,931	"

From South Haven, during the same period, the shipments have been as follows, viz:

By express, all reduced to pecks	32,447
Small fruits, shipped by line of steamers, 7,453 crates, or	15,906
Peaches, in peck baskets	95,488
Apples, in barrels, 2,918, or	26,262
Peaches, shipped by sailing vessels, estimated	2,000
Apples " " "	13,500
	185,603

From Clapp's pier, (formerly Marks):

Peaches, in baskets of one peck each	7,316
" boxes, (supposed to be half bushels, 666, or	1,332
Berries, in half bushel crates, 100, or	200
Apples, in barrels, 718, or	6,462
	15,310

Saugatuck is the next port as we go north. We have, so far, been unable to obtain a statement of the shipments from this port: and from the best information at hand, we estimate them at about the amount shipped from South Haven, as given above, viz: 185,000 pecks.

We are indebted to C. A. Dutton, of Holland, for a statement of the shipments from that port as follows, viz:

Peaches, in peck baskets	13,827
Grapes " "	5,726
Pears " "	78
Crab apples " "	78
Apples, in barrels, 2,522, or	22 698
	42,407

These give a total of ascertained shipments, (with the exception of the estimate for Saugatuck,) amounting to 1,955,251 pecks of fruit. The shipments, especially of grapes and small fruits, from the port of Grand Haven have doubtless been quite large; but we have been, so far, unable to secure any reliable statement of the amounts. The same is true of the still more northerly ports of Muskegon, Whitehall, Pentwater, Ludington, Frankfort and Grand Traverse Bay; at nearly all of which, important fruit interests are known to exist, although much of the country is yet comparatively new. We are beyond doubt well within the truth, in estimating the total shipments of the ports from Grand Haven, northward, at 1,000,000 pecks; which gives the sum of 2,955,251 pecks, or 738,813 bushels as the total of the shipments from the Michigan "Fruit Belt" during the season now just expired.

This doubtless may be regarded as an extraordinary result, when we consider that the business has almost wholly grown up within the last twelve or fifteen years; and such growth must, no doubt, be mainly attributed to the confidence that our great equalizer of temperatures—lake Michigan—can by no possibility fail us. But that, while broad regions of country may, or do become arid and frosty from the reckless destruction of timber; these broad, restless, unfrozen waters must ever contribute, as now, to the mellowing of the frosts of winter, as well as to the tempering of the fervid heats of summer; their changeless character constituting a sure guarantee that, in the future, as now, the devotee of Pomology shall find, upon these shores, a home alike for himself and his cherished specialty.

The planting of fruits along the entire shore is proceeding at accelerated rates; and when we consider that, with the exception of berries, nearly the entire shipments above enumerated may be said to be the product of orchards as yet only partially in bearing, it will be readily conceived that the increase is likely to be at least fully maintained, for some years to come.

Doubtless one of the most encouraging circumstances connected with the growing of fruits along this shore of the Lake is the fact that even the most delicate and perishable fruits can be left upon the plants till fully ripe—put on board steamers at night, and be laid down in any of the cities upon the Lake, in the early morning, as fresh as when gathered, instead of being subjected to the necessity of being gathered before maturity to enable them to bear the jar and jolt of a car over hundreds of miles of railroad before they can reach the consumer.

South Haven, Dec. 31, '77.

Field Crops.

CHEAP TURNIPS.

HAVING cleared a piece of new land this summer, for winter wheat, I selected about an acre from one end of the piece, shovel-plowed it thoroughly and harrowed it, then sowed it to turnips. For plowing new land we use a strong shovel-plow made for the purpose with a round pointed coulter attached to the point of the shovel, so that when it strikes a root it will pass over and not catch. The soil was loam, and somewhat dry, being a beech and maple ridge. The seed was sown about the middle of June broadcast, and harrowed in among the stumps, receiving no further care until pulling time.

A neighbor harvested the crop on shares, I furnishing man and team to haul it into the cellar. My share measured fourteen two-horse wagon-loads, which we called 350 bushels; his share was about three loads.

Now for the cost which would stand about thus: To three days work, man and team, plowing, harrowing, and hauling, $6.00. By 350 bushels turnips, worth how much? After harvesting the turnips the land was shovel-plowed, and is ready to sow to spring wheat, so, although I fail to get winter wheat on that part of my field, I shall, however, get a crop of spring wheat worth just as much and harvested at the same time as the winter wheat which was sown on the rest of the field.

THE
RURAL NEW-YORKER.

PUBLISHED EVERY SATURDAY.

Address
RURAL PUBLISHING CO.,
78 Duane Street, New York City.

SATURDAY, JANUARY 12, 1878.

OUR readers will not thank us, perhaps, for permitting our Notes and Brevities to be crowded out. The truth is we have never felt so great a pressure upon our space as at present.

WE respectfully call the attention of our readers to the fact that the RURAL NEW YORKER is discontinued at the expiration of the subscription term.

WE particularly call the reader's attention to a series of articles by Professor I. P. ROBERTS of Cornell University, the first of which is presented upon page 22 of the present number.

We earnestly request that all letters containing money, or any communication intended for the BUSINESS DEPARTMENT *of the paper, be addressed to the Editor, the Publisher, or* THE RURAL NEW-YORKER, *and not to any individual. We cannot otherwise guarantee the prompt entry of names upon our books, or the acknowledgment of money.*

THE AGRICULTURAL PRESS.

BUT little over three-quarters of a century has elapsed since, in the year 1800, the Farmer's Magazine, the progenitor of the multitudinous family of agricultural periodicals of to-day, entered on its useful career in the city of Edinburgh. In the succeeding half century the actual productive power of Great Britain, in the article of wheat alone, increased to the extent of supporting an additional population of seven millions. Down to our time this development has continued though, perhaps, at a slower pace, owing to the limits which Commerce has set to the profitable cultivation of the soil of any particular district by bringing into competition with its crops the cheaper productions of other regions. In nearly every other department of agriculture there has been a like advance, and in some, especially in root culture, even a more rapid improvement has been made.

This marvelous development of the agricultural resources of the country, has been mainly brought about by two causes, both of which have been equally beneficial here—discoveries in agricultural science as well as of better methods of tillage, cropping, and breeding, coupled with a speedy and widespread dissemination of these discoveries among those who could utilize them. To the first of these causes of advancement, the agricultural press, here and abroad, has contributed not a little by diligently recording suggestive facts and significant results of various practical experiments as well as by affording to investigators the stimulating encouragement inseparable from a hearty recognition of the beneficent purposes of their researches and the consciousness that their discoveries would be at once brought faithfully to the notice of those who would thankfully profit by them.

By no other means has this been so promptly and efficiently accomplished as through agricultural periodicals. For one farmer who has become acquainted with valuable discoveries in agricultural science or practice by poring over the works in which they are technically described, a hundred have been benefited by them through a more lucid account contained in their family papers. In these, as a rule, not only are all the successive scientific discoveries relating to the occupation of their patrons, described in a popular style and at sufficient length for all practical purposes, but the experiments of hundreds and the experience of thousands of farmers, instead of remaining confined singly to a few in each neighborhood, are made collectively the common property of all. These, if really valuable, are of advantage not only to the present generation, but to all that shall succeed it; for knowledge is cumulative, and each fresh acquisition becomes a permanent addition to the ever-increasing fund that shall bless future ages.

The information in this way obtained is beneficial, not only to the readers of agricultural periodicals, but often, also, to many of their neighbors who still cherish an antediluvian prejudice against what they are pleased to stigmatize as "book farming." It is a well known characteristic of semi-civilized races, that, like the Chinese, they are accustomed to despise the wisdom of outside barbarians, and, similarly, these fast-disappearing relics of the dark ages are apt to consider that each farmer could be benefited by no information on his business beyond the dictates of his own common sense, which often directs his labor at haphazard. Yet, often unconsciously, these wiseacres are influenced in their practice, by the improved methods learnt by their neighbors from suggestions contained in their favorite papers. Generally the editors of these, and always nearly all the contributors to the practical departments, have, themselves, large experience in agricultural pursuits, while the former are ever on the watch for any information from any part of the world, which their experience may tell them might be of service to their readers.

Time was, not very long ago, when it was a reproach and an injury to the tillers of the soil that, while the invention of printing had proved an appreciated blessing to the rest of the community, most farmers would have lost neither pleasure nor profit had FAUST and his co-laborers never lived. Nowadays, however, a habit of reading has been widely developed among the rural population, not a little through the agency of agricultural papers, many of which furnish reading matter which, in valuable information, purity of tone, and variety of interest, will compare favorably with any species of periodical literature.

GOOD RESOLUTIONS.

IT is not necessary to turn the leaves of an almanac, or to consult the signs of the Zodiac to be apprised of the fact that about this time thousands of clever fellows are framing good resolutions whose influences will modify their lives for the next twelvemonth.

This time-worn custom is honored in the observance usually for periods of time varying from fifteen minutes to an entire day. It may be said to constitute one of the limited opportunities that humanity vouchsafes itself to supply its own precepts with an example to match. It has all the fascination of a Chinese puzzle: one knows the pieces are there, but the odds are mainly against the final result being in accordance with the beautifully colored plan.

There are several prominent moral blemishes that, by general consent, are singled out for the especial attention of the New Year reformer. He knows intuitively that they are false gods, and however lustily their priests may cry aloud in their favor, no vocal gymnastics can befog the fact that the cloven foot is as a number nine for prominence. Profanity is the chief, perhaps, of the faults to be obliterated. It is set forth in the preamble that morals and the usages of the best society are inimical to swearing, and it is resolved that the unclean practice be, and is hereby abated. At this point the curtain falls to sweet music, and the first act ends promisingly.

Thus far, the triumph of will over inclination has been so easy and gratifying, that the reformer, emulating Saint Patrick, concludes to drive out all the snakes, while his, so to speak, hand is in. He braces up and issues a pronunciamento against ardent spirits, a ukase against tobacco, and finally runs amuck among an entire schedule of great and little sins, winding up in a fine economic frenzy that attacks the petty cash account, doing agile sums in mental arithmetic that show flattering results three hundred and sixty-five days from date.

After arriving at these conclusions, the reformer rests upon his oars, and standing in "uffish thought" awhile, bethinks himself of the day and its duties. Carefully the swallow-tailed symbol of conventionality is taken from its peg, and by degrees the paraphernalia that metamorphoses a gentleman into the semblance of a head-waiter is spread out, and the art of decoration is practiced in a tranquil state of mind. The reformer stands before a looking-glass that has the defect of showing the left ear on a portion of the cranium antagonistic to all rules of anatomy; at the same time, giving the nose an inquisitive turn into the corner of the right eye that is subversive of good temper. Somehow, the immaculate neck-tie does not fall into those mathematical folds that all are agreed constitute its greatest charm. Another is tried. Impatient muttering recedes before jerky expletives, until at length the vernacular is embroidered with a delicate tracery of profanity. The innocent cause is torn from the neck and wafted into a remote corner before a gale of fluent damnation. Then conscience, in a voice sweeter than the song of the Bulbul, alludes to those resolutions!

It is now necessary to reconsider; but to do this, the nerves should be calmed by recourse to the weed. The effect is sweeter than the honey of Hymettus. Once more the armor of good intentions is girt about his loins, and he makes his first call. It may be termed an undertaking to pay one's respects a thousand times in twelve hours. The descendant of protaplasm yearns for refreshment. He has been proffered, and smilingly consumed gallons of nourishing tea—beef tea. It begins to pall. The palate has improper reminiscences of seductive companions that were boon prior to the era of reform. It sighs for Thomas and Jeremiah, and circumstances conspire to capture preamble, resolutions, and all. The miserable victim wanders home over the sidewalk as if he were describing the pattern of an arabesque, and frames an act to amend an act, against attempting the labors of HERCULES without first cultivating sufficient moral muscle to carry out a scheme that includes the complete revulsion of established habits.

The bull against a comet, so far as known, had no more effect on that erratic heavenly body than good resolutions without persistent endeavor have on bad habits. The reformers must begin *de novo*.

PLANTS IN ROOMS.

IN a few remarks which we made, a week or so ago, touching the healthfulness of plants in sitting-rooms, it was stated that if they were healthful it could only be due to the amount of oxygen liberated and as this amount was quite inappreciable it became a question whether from imperfect drainage and consequent stagnant moisture, the "vapors of decomposition" might not prove a cause of vitiating the air of such rooms. That the amount of oxygen liberated by plants is, even though the room were packed with them, inappreciable is well set forth by MAX VON PETTENKOFER, in the Contemporary Review, in the remark that "the power of twenty pots of plants would not be nearly sufficient to neutralize the carbonic acid exhaled by a single child in a given time. If children were dependent on the oxygen given off by plants, they would soon be suffocated."

PETTENKOFER asked permission of the Royal Winter Garden in Munich to make experiments for several days at various hours of the day and night. He found the result to be that the proportion of carbonic acid in the air in the Winter Garden was almost as high as in the open air. This surprised him, but he hoped at any rate to have one of his traditional ideas confirmed, viz., to find less carbonic acid in the day than in the night, supported by the fact that the green portions of plants under the influence of light decompose carbonic acid and develop oxygen. But even here he was disappointed. He generally found carbonic acid increasing from morning until evening and decreasing from night until morning. He doubled his tests and care, but the result remained the same. This he subsequently found to be owing to the fact that the workmen and others during the day produced so much more carbonic acid than the plants consumed during the same time.

Discarding altogether the idea that plants in rooms have any appreciable power to "purify" the air, PETTENKOFER accords to them hygienic benefits for a quite different reason, viz.,—the impression which they make upon the mind. "The cheerful and happy man lives not only an easier, but, on the average, a more healthy life than the depressed and morose man." He thinks a certain amount of change and recreation is indispensable and, failing others, some seek them by injurious means. There are doubtless some unhappy and morbid creatures who are always discontented—to whom everything comes amiss, and whom it is impossible to help; but the majority of men are easily pleased, find pleasure in little things, though it may be but a sorry life they lead. It is something the same with the pleasures of life as with the pleasures of the table; we must relish our food if it is to do us good. He considers flowers in a room, for all to whom they give pleasure, to be one of the enjoyments of life, like condiments in food, and it is certainly one of the most harmless and refined. We can not live on pleasure alone; but to those who have something to put up with in life, their beloved flowers perform good service. And the same may be said of private gardens and public grounds.

Finally, we think that all the talk about plants being "healthy" in sleeping or sitting rooms "because, you see, they absorb carbonic acid and give out oxygen," may go for naught. There is neither science nor sense about it. In the meantime—while we delight ourselves over their beauty and are pleasantly occupied while caring for them—let us see to it, as we have said, that the earth in the pots be preserved fresh and sweet—that the pots be kept scrupulously clean, lest our plants which we had supposed beneficial to the air, shall prove appreciably injurious.

NOTES.

The Rural's Circulation.—We *must* congratulate our readers as well as ourselves upon the RURAL's prospects for 1878. Up to this time our circulation has so increased over last year that we prefer not to make a more definite statement for the reason that, owing to the storms which prevailed last year at this time, the work of obtaining subscriptions and the mails were delayed. It may be, therefore, that our present increase is in a great measure due to the weather advantage of this year over last, and that much of what we gain now will be lost later. Nevertheless, from overwhelming evidence in great variety, we have little to fear that our circulation for this year will not be greater than it was last. We repeat our assurance to our friends, that we shall do all in our power to please and to benefit them.

MR. J. B. LAWES, the distinguished experimental farmer of Rothamsted, England, closes a letter to us as follows: "I take the greatest possible interest in your agriculture, and can see clearly what an immediate future there is in store for it."

Literary Miscellany.

EVERY YEAR.

ALBERT PIKE.

THE spring has less of brightness
Every year
And the snow a ghostlier whiteness
Every year;
Nor do summer's flowers quicken,
Nor autumn's fruitage thicken
As they once did, for we sicken
Every year.

It is growing darker, colder,
Every year,
As the heart and soul grow older,
Every year.
I care not now for dancing,
Or for eyes with passion glancing,
Love is less and less entrancing
Every year.

Of the loves and sorrows blended,
Every year;
Of the joys of friendship ended,
Every year;
Of the ties that still might bind me
Until time to death resigned me,
My infirmities remind me,
Every year.

Oh! how sad to look before us,
Every year.
While the cloud grows darker o'er us,
Every year!
When we see the blossoms faded,
That to bloom we might have aided,
And immortal garlands braided,
Every year.

To the past go more dead faces,
Every year.
Come no new ones in their places,
Every year.
Everywhere the sad eyes meet us,
In the evening's dusk they greet us,
And to come to them entreat us,
Every year.

"You are growing old," they tell us,
"Every year;
You are more alone," they tell us,
"Every year.
You can win no new affection,
You have only recollection,
Deeper sorrow and dejection,
Every year."

Thank God! no clouds are shifting,
Every year,
O'er the land to which we're drifting,
Every year.
No losses there will grieve us,
Nor loving faces leave us,
Nor death of friends bereave us,
Every year.

A CHINESE CORN-DOCTOR.

KU-YUNG, a city near Nanking, has a remarkable history in connection with the Chinese superstition called "Fung-Shui." The learned as well as the ignorant in China believe that there are good and bad influences in the air, caused by good and evil spirits; and they employ a large number of "fung-shui" doctors to show them how to ward off injurious influences, and obtain good ones.

Early in the Ming Dynasty, about four hundred years ago, one of these doctors discovered that the city of Ku-Yung would produce an emperor, and that all its people would be mandarins or officers. The emperor then reigning, alarmed at the prospect of losing his throne, took steps to have the fung-shui of that city corrected. It was decreed that the north gate, at which the evil spirit entered, should be built up solid and remain so, and that all men of the city should choose of three callings—a barber, corn-cutter or bamboo-root shaver. They were ordered to follow these pursuits because this particular spirit was believed never to come near one who used sharp-edged instruments, and also because an emperor and mandarins would never be chosen from among those who followed these callings.

So the north gate of Ku-Yung has been closed for more than four hundred years, and at the present day no less than seven-tenths of all the barbers in China are from this city; and an equally large number of the corn-doctors, and the dressers of the dried bamboo shoots are known to be Ku-Yung men. These trades are readily granted to them, since it is known to be decreed that they should get their rice in that way. This is a striking illustration of the strong hold which this superstition has upon the minds of both the rulers and people of China.

Our engraving shows one of these corn-doctors following his calling in the open air, after the manner of the barbers, tinkers, pedlars, etc.

HER MOTHER'S SECRET.

CHAPTER V.

[Continued from page 14.]

"I have listened to your mother's distant word," he said, kindly. "I will read her long statement presently. For the present you will stay here. As soon as your servant has had something to eat she can fetch your luggage.

Of course, Edith was only too glad, under the circumstances, to obey. Her grief was too recent, her dejection too great, for her to care about facing the world as yet.

But she meant to do so, and in this fully to carry out her dead mother's wishes. Of love she had had enough and to spare.

Her mother's story had pained her much; and though she had very strong convictions that her mother was right in her estimate of her father, still she could not understand the strange and mysterious circumstances of his marriage and the sudden departure of the officer.

Why had he never sought her out? It would have been easy to apply to the aunt.

But Edith scarcely understood the feelings of a husband who believed that his wife had eloped during his brief absence.

He had wiped her from his heart.

Lunch over, and Martha gone to fetch the luggage from the coffee-shop, the recluse and Edith had a long conference.

CHINESE CORN DOCTOR.

He read the statement carefully, and asked Edith to let him have it to study.

He wanted to read it when alone—this stern old man, who had so loved the young girl, and who revered her memory.

Presently Edith, after some hesitation, spoke.

"My mother wished me to tell you something which I only confessed to her on her death-bed," she faltered. "I promised I would tell you."

"Speak, my dear. I am sure it was nothing very wrong," he smilingly observed.

She told him frankly.

He listened with deep interest, but the name of Royston Yorke startled him.

"He is a distant relation of a friend of mine," he said; "we will make inquiries about him."

"Never!" cried Edith. "I will obey my dead mother. If he had wanted me, and had gained permission to woo me, he would have come long ago."

"I don't know," replied Linton; "but of that we need not speak now. You must rest yourself a little, and then we will see what is to be done."

"As soon as I am well enough," said the young girl, "I will write. In the first place, we must send Martha away," she added, "with a tearful sigh. "I cannot afford to keep her."

"She shall remain with me for the present. I am very short of hands, and now I have a visitor must keep more servants," he added, with a fervor he had not felt for many a day.

Martha returned with the luggage, including the desk, all safe, and was delighted to find herself retained in the establishment.

Edith was at once installed mistress of the house, with the two women and an old man-servant under her. But her hand was light, and the servants soon found the yoke to be so gentle as in fact to be nominal.

Edith was happy in the garden or the library, where she could sit and think. But Mr. Linton who was out a good deal now, insisted on their going out for a stroll on the banks of the river.

Edith was only too willing, as she loved the sight of water, boats, &c., and it distracted her thoughts.

This went on for a day or two, and then Martha particularly noticed that they were followed by a man. He wore a slouched hat, common clothes, and had his face blackened.

At first they thought it an accident, but soon discovered that it occurred on every occasion when they took a walk.

Martha fired up. Edith was uncommonly pretty, and the provincial old lady had heard of such things as young girls being snapped up from under the very eyes of their guardians.

But Edith only smiled, and no one said a word of it to the excellent virtuoso.

When they had been a month in the house, Edith felt so restored that she wished to look out for some work.

"What kind of work?" he asked.

"Teaching," she replied. "I suppose I might set up a school with my thousand pounds."

"No, my dear, that money is sacred," was the eager reply. "It was put away by your mother for a rainy day. Now, listen to me, my dear. I am an old man, and am very rich, with no near relatives. Now, for your mother's sake, let me make you my daughter, adopt you, and leave you my money?"

"You are very kind, generous, and noble," she said; "but I would rather work."

"I never saw such a girl," laughed the old man. "We might find Royston Yorke, and the old man would not refuse my heiress!"

"If Royston Yorke wants me, he will find me," she replied; "but I don't believe he does."

"Then here goes. A man I know something of," he continued, gravely, "by buying and selling pictures for him, has an only daughter the very same age as yourself. She is not polished; she wants the society of a young lady, and she wants you to put something in her head."

"Is she very stupid?"

"Rather stupid and vulgar. She is very good-tempered; but before she thinks of society or marriage, she must have a year's tuition. The price is two hundred guineas a-year," he added. "Will that suit you?"

"Certainly; who is she?"

"The only daughter of Sir Arthur Tressider," he continued. "How he ever married the vulgar city madam, which he did in Rome, is a mystery to me, except that his father loved a fortune. He lived in Rome some time, and then returned to England. He has only this one child, a daughter. To-morrow I will send you there. You are already conditionally accepted."

"I thank you for your kindness," said Edith; and she went out into the garden to think of coming events.

Could she have known!

As she sauntered along, peeping through the railings, she saw the strange man looking at the house.

What could he mean?

As she attempted to retreat, he crossed over in the moonlight, took off his hat, and stood revealed, haggard and pale, Jack Clayton!

She gave a little shriek, and then he was gone out of sight.

She walked slowly back to the house, and up into her bed-room, to collect her thoughts before supper.

The sight of this man had roused thoughts she had believed partially forgotten. Not only did he make her think of dear Longmead, of her mother, and of many kind friends, but it brought before her eyes the trysting oak, and the scenes that passed there.

The night of the attempted murder was again before her, and the sweet awakening to love and hope, and the brilliant vista of the future.

Was it all gone now? All was buried in the grave with her sweet, good mother.

When she went down to supper she was calm and collected, and discoursed with the old man.

"Try and please the Baronet," he said;—"though he yields to his wife and daughter, he is just and good, and will allow no one to be treated below their station in his house,"

"I will try and do my duty," she answered.

"You can do no more," he said.

CHAPTER VIII.

The Baronet's Family.

NEXT day, after taking a farewell of the worthy Mr. Linton and her faithful Martha, Edith started on her journey from Chelsea to Belgravia.

She took only with her her simple luggage, leaving her relics, especially the much-valued desk, in the custody of the virtuoso.

As Edith drove along, she naturally enough speculated in her own mind on what manner of people she was going to live with.

From Mr. Linton's description, she did not expect to lie upon a bed of roses. Whatever might be the good qualities of Sir Arthur Tressider, he would have little to do with her personally. Her duties would bring her chiefly in contact with a vulgar woman and a rather silly girl.

In making his arrangement, Mr. Linton had stipulated that as his young lady friend was of good family and origin, she might be allowed to call herself, in her teaching capacity, Mdlle. Marechale.

The lady thought it odd, but had submitted, especially as the Baronet had at once acquiesced.

"If she is half as accomplished as you say," he remarked, "she is a female Crichton, and may call herself what she pleases."

Her arrival had been fixed for eleven o'clock, and punctually at that time did Edith give her modest knock at the door. She was at once admitted, the footman being civil and obliging as all footmen are when under the influence of a wise and discreet master.

"My lady is in the morning-room," he said; and, opening the door, ushered her in, pronouncing her name as best he might.

A lady was seated in an arm-chair—a lady, fat, fair, and forty; but with a face which, without being repulsive, was hard and unsympathetic.

She slightly bent, and then motioned Edith to a seat, without herself rising.

"You are the young lady recommended by Mr Linton," she said, in a haughty but rather drawling tone, as if it were an effort to speak to anyone beneath her.

"I am Mdlle. Marechale," was the answer, in that quiet, soft voice that in general went to the heart of those who heard.

"That is it; though why anyone should call themselves by such outlandish names, I cannot say," she continued, peevishly.

"You should remember, Beatrice," said a grave and earnest voice, "that that matter has been settled once for all."

Then she saw that there was also present a gentleman of tall and erect mien, a man of about five-and forty, singularly handsome, but with a grave and sad look.

"Welcome to my house young lady," he went on, advancing and giving his hand, "I hope you will find yourself comfortable. Your pupil is engaged"—this with some slight scorn—"in some important millinery transaction. I hope, Beatrice, she will be at leisure shortly."

"I will expedite her," cried Lady Tressider, with an annoyed look.

"In the meantime, Mdlle. Marechele will, I am sure, come to the music-room," continued the husband, speaking with all the respect he would to a duchess, "and let me judge of her powers. Linton has given me such notions——"

"But you can only be disappointed, Sir Arthur," she timidly replied.

She was awed in spite of herself in the presence of this grand-looking gentleman, who seemed to her eyes the perfection of man as he should be.

He opened a door, rang for a servant to take away her wraps, and then led her to the piano.

Edith was always equal to the occasion when music was concerned, and she was soon pouring forth a volume of harmony and melody, which startled the connoisseur.

When she concluded, there was a proud expression on his face, tears were in his eyes, which he covertly wiped away.

"Never, young lady," he said, after a pause, "have I heard such music before. It has thrilled me to the very heart. It sounds like an echo of long ago. You must have had able teachers?"

"My mother only," she replied.

"Your mother——" he began; but at this moment Lady Tressider entered with her daughter.

The latter was very much like her mother, only a smaller edition, with less intellect in the face, and one of those sauve smiles which exasperate the looker-on.

She was well-dressed, and despite her deficiencies in figure, had a certain doll-like beauty about her.

The lady of the house now left with her husband, and the two were alone.

"You play and sing very nicely," said the girl, rather sulkily.—[To be continued.

THE OLD HAG.

M. E. STONE.

I CAN remember, ever since I was a very little girl, hearing the people of my native village make this remark (when anything happened out of the usual order), "As queer as the old hag!" It puzzled me at first, but I soon solved the meaning.

The school-house stood a quarter of a mile outside our little village, and the first time my youthful feet wended their way toward it, I was enlightened by my sister ALICE and another girl, who were leading me.

"You must be a good girl, to-day, METTA," said ALICE, "and not whisper, or the old hag will get you to-night. See" (and she pointed to a log hut in the middle of a field), "that's where she lives."

"Yes," that she will!" exclaimed the other girl; "she's a witch, and once turned a little girl, who was naughty in school, into a great big stone, folks say. JIM CRESSY, he's seen it with his own eyes, says 'she keeps it for a door-step.'"

I was very much alarmed at this harangue, and scarcely breathed a loud word during the whole day. And for months afterwards, if I had committed the slightest misdemeanor in school, I would run with all my might past the old log hut, on my way home, at night.

But, as the years rolled by, I gradually lost all faith in the witch story, and became possessed with the desire to behold this human being, so isolated from the world, upon whom mankind had bestowed the hideous appellation of "old hag."

I had often had stray glimpses of a bent figure, hobbling around the hut. 'Twas rare, indeed, that she ever ventured beyond her domain, which was inclosed by an old, tumble-down rail fence, while I dared risk no nearer approach, not relishing the idea of being turned into—perhaps a hearthstone for an old witch to boil her porridge-kettle on.

I have remarked that, as the years rolled by, my fears subsided, while my curiosity increased. And one bright Saturday afternoon I started out with the secret determination, "live or die," I would make a heroic attempt to get a nearer view of the "old hag," before the day was done.

I took the path through the woods, and after a short walk found myself emerging from the leafy covert, in exact range with the hut, which stood about forty rods distant in the field. Here I stopped and indulged in several sweeping surveys of the landscape, to discern if the coast was clear. No one being in sight, I boldly struck out, and by making swift transits to friendly raspberry bushes, which grew at intervals all along, I felt tolerably certain I had not been observed. Yet it was with a shaky feeling around my heart that I crept into the shadow of a clump of elders and peered through the rails.

My perseverance was not to go unrewarded for soon the door opened, and she appeared on the threshold. Oh, what a sight! to my dying day I shall never forget my first look at her. A poor, bent figure, carrying a great burden on her back, as if the burden of life were not enough. One shoulder being higher than the other gave her a queer, one-sided look, as if just ready to totter over. Her long gray hair hung in straggling locks around the pale, haggard face, which was furrowed and seamed with the marks of age or sorrow. On her left temple just above the eye, as if to brighten the weird affect, was plainly marked a fiery red cross. I can remember this thought dimly presenting itself to my childish imagination: "Was it not a symbol of her life?"

She glanced sharply around her as if in search of some one. I drew back deeper into the shadows in momentary fear of her keen vision penetrating through the thick bushes, to my hiding-place. I was certain she had discovered my approach and had come out for the express purpose of searching for me. There I lay trembling and meditating upon rash plans of escape—vainly wishing sister ALICE was with me; or that I was anywhere else, when I heard a low, musical voice exclaim—"How are you to-day, my sweets?"

Aha! here was a discovery, indeed! Company? I had never known of a single soul who visited her. Who could it be? At the peril of immediate discovery I could not resist the temptation to peep.

Poor, lone soul! looking out of your wretched tenement. Yes, poor, lone soul! whom all the world had forsaken. You were seeking comfort in the Master's lowly gifts.

There she was, that wretched old hag, kneeling in the long grass, caressing lovingly the wild flowers that grew in great luxuriance about the hut.

I heard her say—"Oh, my sweets; my pretty crimson clovers, butter-cups and daisies. You're all out to-day, full blown. I saw you the first thing this morning shaking your bonny heads in the sunshine as the wind went tossing by. And you're here for a whole summer, my precious ones; how came you to come and blossom so sweet just to please old MARGERY? but you ain't afraid of her, oh, no! MARGERY would'nt hurt you, for the world! She only looks at you, and you kinder help her from being all alone. You don't know, my pretties, what an awful thing it is to be all alone; always all alone, with no one to care whether you lived or died. No, you can't know how it is, when you're gone and the wind howls around the hut, or how I keep praying the good Lord to hasten the summer and send you back. 'Twas always so; no one could ever bear MARGERY; her poor old shoulder and the great hump on her back were always against her.

"The old hag," they call me, even the little children, my sweets. I wish they would'nt, for I love them so—why crimson clover, I'd be ready to die to-morrow for very joy if one would come and kiss me, and say how d'ye do, MARGERY?' But oh no! that can't be, they are afraid of me; afraid of me!

Reader, I was a sinless little child then; if I had been older I should probably have stilled under the cloak of pride and selfishness, the noblest impulse of my life. But thank GOD! I did not, for without a moment's hesitation I climbed the fence and with tears of sympathy streaming down my cheeks, I caught the old creature's hand in mine and said, as I bent and kissed her, "How d'ye do, MARGERY?"

Great GOD forgive us! how shall we ever answer for these poor neglected souls that the kiss of a child can so overcome? She gazed upon me for several moments in mute astonishment, then burst out sobbing and laughing alternately, saying over and over to the senseless flowers: "She did it my sweets! just think can you believe? Some one has really kissed MARGERY and said 'how d'ye do!'"

* * * * * * * * *

She has been dead this many a year; the old hut tumbled in ruins long ago; the people of the village have ceased to speak of her. She was always a wonder to them, "the queer old hag." They looked at her outwardly, no one ever dreamed a beautiful soul lay hid in such a rough casket. But I knew it and learned to love her well.

The day she died—oh, such a beautiful day—the daisies, buttercups and clovers how they swung their heads and peeped in at the old door! All day long she lay with one hand locked fast in mine. At sunset, when the yellow rays streaked the crimson banners hung in the west, the angels came (they were not ashamed.) She heard them, the beautiful soul came up and looked out of its prison windows with such a glad look, such as the prisoner wears when, after dreary years of darkness, the iron bars fall and the door of his cell swings back, letting in the blessed sun-light once more.

I dressed the poor, worn body for the grave, smoothed back the tangled hair, filled the tired hands full of her flowers.

In a stony corner of the graveyard, overgrown with briars and nettles, they made her grave. No one had been buried in that part for years, it was so desolate and nothing would grow there, but it was good enough for an "old hag." A wooden mark was erected and many scoffed when I begged them to put MARGERY on it.

I was called away soon after her death and did not return until the following summer. One morning I entered the graveyard for the express purpose of placing a few flowers on the grave in the desolate corner. What was my surprise to behold it! There above, and all around it "her sweets" were growing, tossing their crimson, white and yellow heads, saying plainly "we've followed you MARGERY!" My poor flowers were not needed, I saw in a minute, so I placed them on rich old granny MARKHAM'S grave which looked singularly bare for all the costly monument which cast its shadow over it, thinking to myself, GOD was MARGERY'S only friend while she was on earth. He sent the simple wild flowers to cheer her here, and now He has sent them to cover her grave.

Year after year they come, more luxuriant each time. A sweet-briar rose has been added, blue and white violets peep up, the seeds of rare plants are wafted that way until the desolate old corner is a glowing Arcadia. The birds sing the sweetest there, the sunbeams are the brightest, the children love to play longest near the grave. Once, one more wise than the average, called it "GOD'S corner" and it has borne the name ever since.

SALLIE, SISTER WANTS A CHEW!

BY A TEXAS IMMIGRANT.

WE lived not far from Austin, the capital of Texas. The neighborhood was sparsely settled and there were only three eligible young ladies in the vicinity. MATTIE was the tallest and handsomest, twenty-one, the only daughter of a stock raiser and farmer, and the other two were very jealous of her because she had a city beau. ANNIE was my cousin, nineteen, and the prettiest and proudest of the trio. SALLIE—God bless her!—was the sweetest creature in the country. She was twenty-one, our next neighbor, and the second of three daughters, the eldest being married but still living in her father's house, and the youngest—a little girl not yet in her teens.

Somehow I liked SALLIE, and SALLIE never said she didn't like me. How my face would flush and my heart beat, was a caution, when I'd see that red cape and white sun-bonnet—confound the thing it was so big and so stiff, and always in the way!—a-moving round the rail fence and nearing the gate.

She was a pretty little girl, short and thick-set, with a round face, white skin, gray eyes, heavy eye-brows, and a luxuriant wealth of raven tresses that, fastened with a claret ribbon, in flowing streams depended o'er her shoulders. She had a sweet and winning way about her, so she had. To be introduced was to be enamored, and sure as fate, OLE couldn't help it. Her victims lay around, as plentiful as did dead cattle on the prairies three winters ago! She was lively as a cricket, chatty as a parrot, nimble as a deer, and frolicsome as a spring lamb. She was born in laughter and reared in adventure, and more ready for possum or wild-cat hunting than for Singer's Sewing Machine.

The Mustang's back was more frequented than the cow-hide chair, and walking pace was purgatory.

SALLIE was always with the boys and the boys liked SALLIE. The "niggers" at the shanties said "Miss SALLIE be de best gal in de country; she ain't no common gal, Miss SALLIE ain't!"

Somehow or other, once or twice a week, SALLIE was sure to drop in our way before sundown, and ANNIE would make her stay to supper. By the time the coffee and biscuits, and a bit of bacon or squirrel, and the few cow peas left over from dinner, had disappeared, and the dishes were washed and I had looked over the Galveston News, the sun was down and SALLIE must not go home alone, but so long as I was there she never wanted a willing escort.

Much to my chagrin ANNIE would sometimes proffer to accompany us; I could not refuse her, because she was otherwise so good and considerate of me, but it would do your heart good to see how sympathetic SALLIE would get all of a sudden. She would remind ANNIE of the spell of toothache that succeeded the dance at Stockdale, the time she had with neuralgia after that night at Ralston's, and the probabilities of another attack of the chills, which at this season of the year was sure to be followed by pneumonia; "and just think how many are dying of pneumonia, ANNIE!"

But SALLIE in this respect was just like some other ladies I know of—if there be a wrong road to glory they're sure to take it. Time and again I told her if she wanted to carry her point not to contradict ANNIE for, sure as preaching, any attempt to deny, refute, or threaten that girl, was instantly met by extreme stubborness and determined retaliation. There was no go back to her; but by open-hearted, honest kindness, she was as obedient as a child.

I was given to understand that SALLIE never used tobacco or snuff in any form, but was sternly opposed to it; ANNIE and the neighbors told me so, and I believed them. Such a qualification among the ladies in the neighborhood was a rarity, and I liked SALLIE ten times more for her immunity.

Now, I never smoked a pipe or chewed a quid, and the very sight of the snuff-bottle and stick would almost turn my stomach. No more disgusting sights could meet my eye than the encrusted tracery of tobacco juice along the lips or down the chin; the prominent "snuff brush," or the perpetual moving of the jaws as if a cow or a sheep were chewing its cud. [Oh! that of God's most noble creation. His most lovely workmanship should so degenerate beneath such brutality as "dipping and chewing, and spitting!" Whisky may be the greatest curse upon earth, but "dipping and chewing and spitting"—Oh! filthy abhorrence!]

"Come WILLIE, let's go down and see SALLIE to-night," said ANNIE to me at supper time. Of course, I was willing enough. We found SALLIE and the rest of the family seated and half dozing, half talking, under the Umbrella China trees in front of the house. She bounded to meet us, and after the usual congratulations and pleasantries, we entered the house, the lamp was lit, and we sat down to a game of cards.

The three of us were round the table playing casino, talking freely, laughing merrily, and cracking jokes like nuts at Halloween. SALLIE had three queens, and I the fourth; SALLIE built two, ANNIE took the other cards, and I swept the queens, with "a sweep, SALLIE, you know I love the ladies!"

Just at that moment into the room burst her little sister with "SALLIE, sister wants a chew!" Without a moment's hesitation, SALLIE plumped a half-chewed quid of tobacco out of her mouth into her hand, gave it to her sister, who scampered an exit!

Good heavens! Had a Comanche knife at that instant described the circuit of my scalp, I could not have been more staggered. I looked at ANNIE. ANNIE blushed. I trembled. ANNIE pressed her foot upon my toes.

"Play, Mr. ——," cried SALLIE, "we're waiting for you."

I looked at the table and then at my hand. I asked, "What's trumps?" and "Who played last?"

ANNIE, perceiving my confusion, jumped up with "Euchre, SALLIE, euchre! We've played casino long enough. WILLIE, please fetch me a dipper of water from the bucket at the door. Oh no; draw us a fresh bucketful, please."

I took the hint, and sprang for the well, secretly thanking ANNIE for her presence of mind and assistance.

The consternation was momentary, but the *disgust* was permanent. I returned with the water, and played a few more games, "looking," as SALLIE expressed it, "as sober as if you had staked your Choctaw pony and lost it."

We went home early; but I did not crease the sun-bonnet that evening. I went to bed; but sleep evaded me, and instead, "SALLIE, sister wants a chew!" haunted me. Morning came; but I could not think of anything else. The mocking birds and cardinal birds scorned to twitter anything else but, "SALLIE, sister wants a chew!"

I asked myself why I was so troubled—what business was it of mine if SALLIE did chew? But I could find no answer. A day or two after, I saddled for San Antonio, and was gone nearly a fortnight. I got home in the morning, and SALLIE came to see us in the evening. She was as radiant and brilliant as ever; but every time I looked at her, "SALLIE, sister wants a chew!" echoed in my ear, and the blood flushed to my face.

I was tired and sleepy, and retired early, without even first going home with SALLIE. Somehow or other, I had no desire to go; when I thought of her, a loathsome feeling crept through me. I did not want to see her, far less, think of her; but in either case I couldn't help myself.

Time rolls on, and since that night I have often escorted SALLIE to her father's gate as before, behaving as frankly and as jollily as I could, but every time I saw her, "SALLIE, sister wants a chew!" shot vividly through my mind.

The red cape in the distance, instead of inspiring gladness, bred aversion, and that "confounded sun-bonnet" molested me no more.

SALLIE'S visits to our house gradually became less frequent, and now she is married to a new neighbor, a stranger, from Kentucky. If he likes tobacco, he has got a good wife; for SALLIE is a kind and considerate creature, a most lovable woman, and an excellent housekeeper.

> "But the purest love and strongest
> Love that has endured the longest,
> Braving cross, and blight, and trial;
> Fortune's bar or pride's denial,
> Would—no matter what its trust—
> Be uprooted by Disgust."

FOR THE BENEFIT OF THE NOSE.

BY CAROLUS.

AMONG the most curious revelations made, is an analysis of the Perfumes. The ethereal luxuries, no matter by what awful names they are called are exposed, one by one, to the sight, as it were, of the public, and their competent parts numbered and proportioned. They are usually obtained from flowers, and Mr. Piesse remarks, that "the extensive flower farms in the neighborhood of Nice, Grasse, Montpellier, and Cannes, in France, at Adrianople (Turkey in Europe), at Broussa and Uslak (Turkey in Asia), and at Mitcham, in England, in a measure indicate the commercial importance of that branch of chemistry called perfumery" an importance which will be more readily understood when it is stated, that "one of the large perfumers of Grasse and Paris employs annually 80,000 pounds of orange-flowers, 60,000 pounds of cassie-flowers, 54,000 pounds of rose-leaves, 32,000 pounds of jasamine blossoms, 32,000 pounds of violets, 20,000 pounds of tuberose, 16,000 pounds of lilac, besides rosemary, mint, lemon, citron, thyme, and other odorous plants in larger proportion." There are four modes of obtaining the perfumes from plants—namely, expression, distillation, maceration, and absorption. In maceration, the flowers are put for a certain time into melted deer or mutton fat, which, in consequence of a natural affinity, draws forth the perfume, the fat thus becoming pomade. When olive-oil or ben-oil is used instead of suet, the result is "huile antique" of such a flower.

When mentioning bergamot Mr. Piesse tells us it should be preserved in well-stoppered bottles, and kept in a cool dark cellar; light, especially direct sunshine, deteriorating all perfumes excepting rose. The labor of collecting the exquisite odor of the sweet-briar is so costly, that an imitation is palmed upon the public instead, composed of French rose-pomatum, cassia, fleur d'orange, verbena, &c—surely an excellent perfume in itself. The extract of heliotrope is in the same category; there is no heliotrope in it, but it is nevertheless a very nice perfume. Neither is honeysuckle used as a perfume, but it is well imitated. Jasmine, on the other hand, is much prized by the perfumer. "When the flowers of the "Jasminum odoratissimum" are distilled, repeatedly using the water of distillation over fresh flowers, the essential oil of jasmine may be procured. It is, however, exceedingly rare, on account of the enormous cost of production.

Lily of the Valley is a delightful perfume; but there is no such thing as lily of the valley in it. Rosemary plays an important part in Eau-de-Cologne, and is the principal ingredient in Hungary Water. In both these compositions it is the refreshing and invigorating element. The perfume we call Verbena, everybody knows, is delicious; but verbena is not of its ingredients, the distilled spirit of the plant being too expensive for the manufacturing perfumer. The essence of the violets is rarely genuine, but from a different cause: the demand for it is so enormous, that the trade is as yet unable to keep pace with it.

On coming to the perfumes derived from animals, our author has a curious remark: "In its pure state, civet has, to nearly all persons, a most disgusting odor; but when diluted to an infinitesmal portion, its perfume is agreeable. It is difficult to ascertain the reason why the same substance, modified only by the quantity of matter presented to the nose, should produce an opposite effect on the olfactory nerve; but such is the case with nearly all odorous bodies, especially with ottos, which, if smelled at, are far from agreeable, and in some cases positively nasty—such as otto of neroly, otto of thyme, otto of patchouly; but if diluted with a thousand times their volume of oil, spirit, &c., then their fragrance is delightful."

It may seem remarkable that the odor of any particular flower should be imitated to absolute perfection by a combination of other flowers. Another thing worthy of remark is this: 'The odor of some flowers resembles others so nearly, that we are almost induced to believe them to be the same thing, or, at least, if not evolved from the plant as such, to become so by the action of the air-oxydation. It is known that some actually are identical in composition, although produced from totally different plants, such as camphor, turpentine, rosemary.

Mr. Piesse illustrates his notions regarding the relationship of odors by the recipe for imitating the essence of sweet-pea, which is this: 'Extract

of tube-rose, extract of fleur d'organge, extract of rose from pomatum—and exract of vanilla.' This composition is formed with the idea that the odor of sweet-pea resembles that of orange-blossom, and the imitation is brought still nearer by the addition of the rose and tuberose. 'The vanilla is used to give permanence to the scent on the handkerchief, and this latter body is chosen in preference to extract of musk or ambergris, which would answer the same purpose of giving permanence to the more volatile ingredients; because the vanilla strikes the same key of the olfactory nerve as the orange-blossom, and thus no new idea of a different scent is brought about as the perfume dies off from the handkerchief. When perfumes are not mixed upon this principle, then we hear that such and such a perfume becomes "sickly" or "faint" after they have been on the handkerchief a short time.'

We have now opened, we think, by this little bit of philosophy, a very interesting and elegant subject of inquiry for our fair readers, and raised the toilet-table to something like the dignity of the library table. A perfume to them will now convey an intellectual as well as a sensuous pleasure; and perhaps they may be even brought to listen to the counsel of Mr. Piesse, and *educate* that feature which, even in its present state of ignorance, and by whatever name it may be described—Grecian, Roman or retrousse—is so important to the character of their physiognomy. "Many persons," says our author, "will at first consider that we are asking too much, when we express a desire to have the same deference paid to the olfactory nerve as to the other nerves that influence our physical pleasures and pains. By tutoring the olfactory nerve, it is capable of perceiving matter in the atmosphere of the most subtile nature: not only that which is pleasant, but also such as are unhealthful. If an unpleasant odor is a warning to seek a purer atmosphere, surely it is worth while to cultivate that power which enables us to act up to that warning for the general benefit of health."

Reviews.

RECENT LITERATURE.

The Bar-Rooms at Brantly. By T. S. ARTHUR. Philadelphia: Porter & Coates.

BRANTLY is a delightful Arcadian retreat, free from the vice of intemperance. It has but one inn, presided over by a model inn-keeper. Finally the tempter appears on the scene, and through the medium of a grand hotel scheme, intemperance is introduced into the place, and troubles spring up faster than mushrooms. Here comes in the strong part of the book. Mr. ARTHUR is well known for his temperance principles, and the caustic qualities of his pen are not diminished because dipped in cold water. The horrors of intemperance are painted in lurid colors, and it is clearly shown that the way of the transgressor is hard. Those sufficiently interested in the subject of temperance to take it diluted in poems and novels, will find this book extremely readable. For our part, we are so radical as to be intemperate in our desire to take the doctrine "straight," and never make a "rye" face.

There She Blows! or The Log of the Arethusa. By Capt. W. H. MACY. Boston: Lee & Shepard.

IT is unusual to find a book of adventure by sea that does not paint the life of a mariner in rose colors. Somehow, authors seem to fancy that the nascent ideas of boys must not be rudely shocked with too much reality. Capt. MACY has, in the present work, given an entertaining account of whaling voyages, without omitting the hardships incident thereto, and by making the story a reflex of real life, adds to its interest, while it will dissuade the effervescent young men who long to see the world before the mast, from leaving "cruel" parents in too great haste.

The Red Hill Tragedy. By Mrs. E. D. E. N. SOUTHWORTH. Philadelphia: T. B. Peterson & Brothers.

MRS. SOUTHWORTH is so well known that each new book addresses itself to readers who have already been captivated by her facile pen, and therefore swallow the absorbing stories whole, without pausing to critically taste the flavor of the production. We have no doubt the Red Hill Tragedy, which is issued in attractive form, at a popular price (50 cts.), will be read with great interest.

American Berkshire Record. Published by The American Berkshire Association. Edited by P. M. SPRINGER, Springfield, Mass.

THE second volume of this valuable record is gotten up in strong cloth binding, and printed on toned paper. The classification and arrangement of contents are good. Mr. SPRINGER may be congratulated on the satisfactory way in which he has performed its duties.

Two Years Behind the Plow; or, The Experience of a Pennsylvania Farm-Boy. Philadelphia: Claxton, Remsen & Haffelfinger.

IN this round, unvarnished tale, the author tells all he knows about farming, including his knowledge of the Friends. The book has no reason for being, that we can discern. It is neither instructive nor interesting.

A Woman's Thoughts About Women. By Miss MULOCK. Philadelphia: T. B. Peterson & Bros.

THIS book is composed of essays that appeared in whole or in part in Chamber's Journal. They include subjects of interest to all women, conveyed in a style that is easy, pleasant, instructive.

For Women.

CONDUCTED BY MISS FAITH RIPLEY.

IN MEMORIAM.

Our Lost Darling.

HECTOR BERTRAM.

THERE'S a gloom about the fireside,
All is chill to-night:
God recalled the little darling
And we miss the light.
In the spring she came unto us—
Lingered here a while;
Then the angels came and took her,
Robbed us of her smile.

* * * * * * * * *

Often-times we wonder, vaguely,
Does our darling know
That across the shadowy distance,
All our eager longings go?
Does her heart e'er think of "Papa?"
Does she e'er regret?
Or do babes, so young translated,
All of earth forget?

God selects the choicest blossoms
For His home above,
And He glorifies the children
With a father's love.
He, allwise, knows which is safest;
We must not rebel,
Though He calls our richest treasures,
Yet we know "'tis well."

GIRLS AND THEIR "BEAUX."

MARY A. E. WAGER-FISHER.

I HAVE a true story to narrate to the girls—to such of them as accept association with young men whose antecedents they know nothing about. In European countries a history of this sort would be almost an impossibility, owing to the social laws that there govern the intercourse of young men and maidens. In this country,

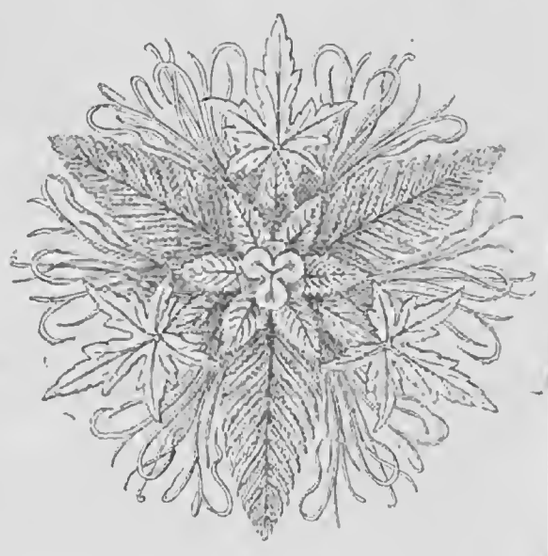

FIG. 1.

where the license of society permits complete liberty of action in regard to such intercourse, many indiscretions are indulged in that result, at times, in very poignant and heart-breaking sorrow.

A young man—good looking, gallant, pleasant, intelligent—comes into the neighborhood. He makes himself agreeable to the girls, and in a fortnight, or month's time, they accept him as escort to ball, party, "night meetings," singing schools, lectures, etc., and this without having any absolute knowledge of who, and what, he is. He has been introduced as Mr. So-and-So, with which vague passport he makes his way into general society and into the sanctity of private houses. But the story is better than any remarks on the subject can be. Every word of it is but too sadly true:

A few summers ago, a young man, apparently a tourist, alighted at the most aristocratic hotel in the beautiful village of I——, in Central New York. While lounging on the front piazza, his attention was arrested by a very pretty young woman whose daily walk led her past the hotel. He inquired who she was, and in a short time had learned from some gossipy co-lounger, that she was ALICE KENT, that her parents were of the highest respectability in the town, and that they had relations living at a certain place in New England. As it happened, the young man knew something about these relations, his own place of nativity having been near their neighborhood.

He had no acquaintances in I——, but being determined to make the acquaintance of Miss KENT, he resolved to introduce himself by forging a letter of introduction to her family from one of the New England relations. This done, he presented himself at Mr. KENT's residence, delivered his letter of introduction, told a plausible story concerning his business at I——, and was received with the courtesy that is usually accorded pleasant people bearing similar credentials. His attentions to ALICE soon became very marked—so much so, as to excite the interest of her parents, who at various times felt inclined to write to their Massachusetts friends for further particulars regarding the young man to whom they had given the introductory letter, but always neglecting so to do. Meantime, ALICE and the young man walked, talked, and rode together, their rides frequently extending to an hour as late as ten o'clock in the evening.

One day, a few weeks after the beginning of this acquaintance, Mr. KENT returned home with the announcement that the young man had suddenly left the village without paying his hotel livery, and other bills; that a telegram and an officer had been sent after him; that an examination of the contents of the trunks left behind him had aroused suspicions of a grave character, etc.

The effect of this news upon ALICE was most alarming. She said little, but it was plainly evident that she suffered intensely. The young man was arrested, brought back to I——, a description and account of him sent to New England where the relatives of ALICE lived, and the information obtained that he had a wife living there, that he was an untrustworthy character, and that his letter of introduction was a forged one.

ALICE's parents, believing that nothing more serious than a "flirtation" and perhaps sincere love-making had transpired between him and their daughter, expressed themselves as being glad "that it was no worse:" when the girl surprised them by sinking on the floor at her father's feet, crying, "Oh, father, it could be no worse!" She then confessed that she had been privately married to the young man a few days before upon one of their long drives in the country, and detailed the persuasions and means he used for wishing that the marriage be kept secret.

The anger of the parents equalled the anguish of their daughter, and a criminal prosecution for bigamy was begun against the young man. It was a useless thing to do, so far as ALICE was concerned, for a power higher than earthly edicts was surely lifting her beyond the terrible result of her folly. She was dying of a broken heart.

The trial resulted in establishing the guilt of the adventurer, and he was sentenced to State Prison for five years. After sentence was pronounced upon him, he was taken, at the earnest request of ALICE, to see her. The jailor led him into her room, where she lay dying, and kept his eye upon the prisoner, as ALICE pleaded with him for the sake of the love she had given him, to reform his life. When she put her thin hands on his and told him what she had suffered because of him—how truly she had loved him—that she was soon to die—that her parents were heart-broken—it was enough to soften the hardest heart. But he stood unmoved, and when the jailor led him away, he sneeringly laughed and made some light remark about the ease with which girls were won. Three days later he was taken, handcuffed, to Auburn, and on the same day the body of ALICE KENT was carried to the graveyard.

What need to add more? No girl wishes to learn discretion through a self-experience like that which broke the heart of ALICE KING. But are you all sufficiently careful of your associations? A suspicious manner and a haughty bearing are neither necessary nor pleasing; one may be civil and polite without intimacy. But it is far better to decline the social advances of persons whom you do not know, than to receive them and afterwards have cause to blush because of your acquaintance with them. Rather than be too easily approached, it would be better to be like the late Judge NICHOLAS of Kentucky.

"Let me make you acquainted with Judge NICHOLAS," said a gentleman to a friend, himself a judge, as NICHOLAS entered the Bank of Kentucky one morning.

"It can't be done," responded the friend, "it has been tried several times."

With him, introduction did not introduce—a very good motto for young ladies who meet with indiscriminate society.

HOME DECORATIONS, ETC.

WE present, at Figure 1, a very pretty design in beech and maple leaves, and grasses, for ornamenting a table-top. For the information of those who have never tried this kind of decoration, the following instructions are given:

Paint the wood black, or very dark-brown, let it dry, and rub it smoothly with pumice; next varnish. While the varnish is still wet, lay your ferns, leaves, and grasses down upon it, following design given. A pin's point will aid you to move and place the fragile stems which will not bear much handling and must lie perfectly flat. As soon as the pattern is in place, varnish again. Thus enclosed in a double wall of varnish the ferns and grasses will keep their places perfectly.

FIG. 2.

FIGURE 2 is a braided initial for a pillow-sham. It is here shown very much reduced in size. Any RURAL ladies who like this style of design may have the same stamped, free of charge, by addressing me. Be careful to state size required.

Long gloves ornamented with embroidery, are at present fashionable for evening wear. They are of white or pale shades, pink or cream kid, embroidered in colors to correspond with the trimmings on the dress.

These gloves, however, if bought already embroidered are costly, so that ladies frequently

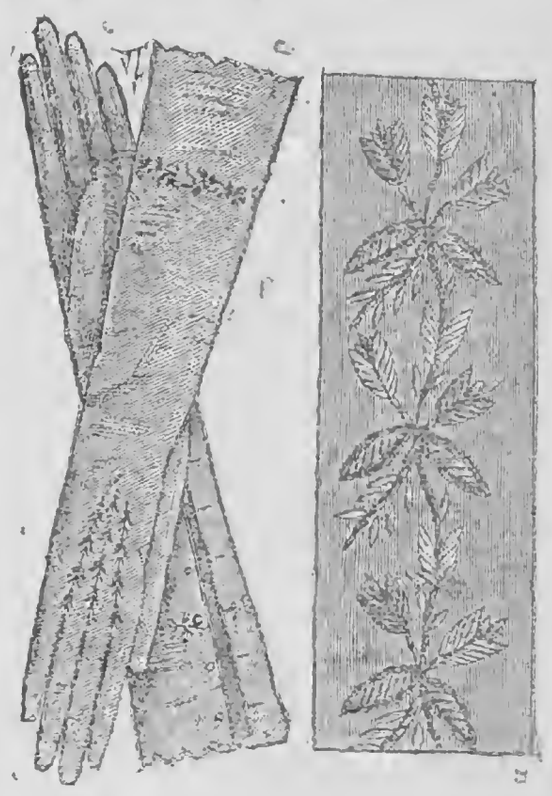

FIG. 3. FIG. 4.

purchase plain gloves, and embroider them with French embroidery silk. The design shown at 4 is suitable for embroidering gloves.

USEFULNESS OF OLD MAIDS.

CLAUDE RAYNOR.

PEOPLE who exist in this latter half of the nineteenth century, are wont to discuss the question of the availability of ancient maidens for useful purposes, with the most absurd gravity; as if celibacy might, of itself, unfit one for the ordinary duties of life, and as if marriage were the only gate to the land of usefulness. But, strange as it may seem, it has been proved that old maids can do a great many things very well. It is evident to all close observers, that woman has been known to cook, sweep, scrub—in short, to perform all the labors and duties of a housekeeper, and that in the best manner, without ever having visited the matrimonial altar. It has also been clearly shown that she can be a first-class milliner, tailor, saleswoman, teacher, book-keeper, telegraph-operator and shown has herself efficient in many other ways that "time would fail me to tell of," without ever saying over, even to herself in a whisper, the marriage formula.

That old maids can win a royal position in literature and art, there is *more* than a hint in the names of ALICE and PHOEBE CARY, FREDERIKA BREMER, CHARLOTTE CUSHMAN, ROSA BONHEUR, HARRIET HOSMER, and very many others.

And yet there are those who, in the face of the record that single women have made in all the past, will ever and anon raise the solemn inquiry, "Is there any place for old maids in the social economy?" Is there any way to utilize them?" They will ask this with the most ridiculous earnestness, as if the old maid were a new kind of bug or animal, discovered very recently, and with haunts and habits wholly unknown.

But perhaps, with them, the question is whether old maids will have a usefulness peculiar to themselves. In other words, do they subserve any purpose which, as married women, they could not?

The case seems a little doubtful, but let us see. There has been much written about the self-sacrificing old maid who yields herself up a willing victim to the demands of numerous brothers, sisters and their little ones, and so manages to annul her natural worthlessness. Well, some of them do that way, and some of them do not, and besides a widowed sister or aunt might do just as effective service in the martyr enterprise, so that does not prove anything.

I can think of but two branches of business of which old maids have the monopoly, and it takes two kinds of spinsters to attend to those. The hatchet-faced, vinegary piece of antiquity may be useful in driving weak, timid souls into matrimony from a fear of being, some day, like unto her; while the gentle, sweet-faced, serene specimens serve to encourage others to be true to their own womanly instincts and walk bravely through a solitary life, rather than do violence to their natures by a marriage based upon anything else than pure affection.

I know of no other mission peculiar to old maids; but as there is such abundant testimony to the variety and importance of their work, it seems rather unfair to ask that they do everything that other women do, and a very great deal besides, to prove their right to "life, liberty, and the pursuit of happiness." And when we ponder the fact that old maids have even trained up children to a maturity of honor and usefulness, it does seriously suggest the idea of an essay or two upon the "usefulness of married women, as such."

L, S.—We cannot recommend the cosmetic you mention. Most preparations for "improving the complexion" are to be shunned, as they contain poisons which in not a few instances have produced paralysis in the face and arms of those who have used them.

The Querist.

ANSWERS TO CORRESPONDENTS.

WILL Mrs. Kate S. Burr please send her address to the Literary Editor, at this office?

Mrs. M. E. Boardman.—My house plants are dying, and I find the dirt in the pots infested with worms, the product of a small fly. Can you tell me the cause and remedy?

ANS.—See the floricultural article by Mr. William Falconer last week.

C. K. C., Beloit, Wis.—Will the RURAL please tell me what it thinks of Edwin Alden's Advertising Agency, Cincinnati, Ohio? The said Alden sent me catalogue of the principal American newspapers, and claims that he inserts advertisements in any paper in the United States at publishers' lowest rates.

ANS.—Our transactions with Mr. Alden have extended over a term of years, and we have always found him to be exact, trustworthy, and obliging.

Subscriber.—If Russell & Co., jewelers, No. 37 Bond St., are not a good house, they are trying to swindle a great many people.

ANS.—It is not too much to say that if these fellows practice any of their swindling methods on readers of the RURAL NEW-YORKER, it will not be because of lack of ample warning on our part. We have on three occasions, given a history of this firm, and we can only repeat, that they should be rigorously shunned.

T. H. S., Va.—Will the RURAL please tell me (1) Where I can get Chufas for seed? I wish to give them a trial. (2) Also peas, to be plowed under in the fall. (3) Which is the best turnips for stock?

ANS.—(1 and 2). From R. H. Allen & Co. of this city, Whitman & Son, Pratt St., Baltimore, or through any dealer in agricultural seeds and implements in the next town to you. (3). The Swedish turnip or ruta-baga, containing less moisture than the other varieties, is more nutritious, but is better for fattening than for producing milk. In England, twenty tons of swedes are considered equal in nutritious value to twenty-five tons of the common yellow sort, or thirty tons of the white variety. On the whole, there is no doubt but this is the best turnip for stock.

Bleaching Broom Corn.

A. S. H.—How is broom corn bleached? Is it done before or after the broom is made? How am I to ascertain what quantity to take to make it look right?

ANS.—Broom corn is bleached after it has been properly dried, but before the brooms are made. It is only necessary to bleach the wrappers. In a small way, this can be done in a hogshead or a dry-goods box, capable of holding, say, enough for forty brooms. Perforate a few holes in the bottom, place it over a depression in the earth containing an iron basin in which is half a pound of sulphur for each bleaching. This can be readily melted by the application of a hot iron or otherwise. The corn should be wet before bleaching, and spread out or hung up so as to expose a large surface, and the receptacle should be covered with a piece of old carpet, to confine the fumes of the burning sulphur.

Remedies for Lice on Cattle.

P., Wayne Co., Pa.—Will the RURAL please inform me of some safe and effectual method for destroying lice on cattle?

ANS.—Lice on cattle are the result, in nearly every case, of a low condition brought on by insufficient food, and the surest remedy, therefore, is to keep the animal well fed, for no application will long protect an emaciated beast. Mercurial ointments, generally recommended as a remedy, are dangerous, and should be avoided by all except those who are very careful. The best method of destroying the vermin is by rubbing their hides well with an ointment composed of cayenne pepper or Scotch snuff, mixed with hog's lard, or any kind of oil, or soft grease. Carbolic acid soaps and compounds are also very safe and effective remedies for these pests and other animal parasites.

What a Creamery is.

A Novice.—Will the RURAL please tell me what is meant by a creamery?

ANS.—A creamery, in the usual acceptation of the word, is an institution to which the farmers of any neighborhood send their milk to be manufactured into butter, just as others send theirs to cheese factories, to be made into cheese. It is owned either by one person who manufactures the product for a stipulated consideration, or by an association of the patrons who appoint a manager or superintendent to conduct its business. The milk is brought either once or twice a day. Some creameries also make skim cheese, while others feed the skim milk and buttermilk to calves and swine. In the former case, it makes little difference whether the milk is brought once or twice a day, as any loss of butter resulting from the delay is compensated for by the extra richness of the skimmed milk, and consequently of the cheese manufactured therefrom; in the latter case, however, it is usually considered advisable that the milk should be brought every morning and evening to insure the greatest possible amount of butter.

News of the Week.

CONDENSED NEW YORK TELEGRAMS.

TUESDAY, January 1st., 1878. — The President's silver wedding was celebrated yesterday. So was Mrs. Hayes'! An embargo of mud out West, roads impassible except on horseback.

The Czarowich will remain in Bulgaria, with Todleben in actual chief command. Russia, while ready to listen to direct proposals for peace, doesn't think an intermediary necessary. There are 25,000 sick Russians in Bulgaria.

England has gone to war with the Caffres in southern Africa. There is much danger that the trouble will spread—perhaps as far as Russia. Spain has broken off all relations with the late queen who will never be allowed to return to that country, cause—her recent advances to Don Carlos,

WEDNESDAY, Jan. 2.—The two Houses of the New York Legislature organized yesterday—Husted, Speaker; Vrooman, Clerk. Strong opposition manifested to resumption of specie payment; farmers and lawyers less in number than usual; merchants more.

A junction has been made before Erzeroum of the forces under Gens. Melikoff and Tergukassoff. Russian officers in Bulgaria have orders to receive proposals for an armistice if sent in direct by the Turks. More engines, bridges and cannon ordered by Russia from Germany. Gambetta has gone to Rome to hold consultation with the Italian Government.

THURSDAY January 3.—Two tons of nitro-glycerine exploded at Neegaunee, Mich., while being loaded on a railroad car. Loss seven lives and $2,000. Ex-Governor Bullock of Ga. is on trial at Atlanta on charge of being a cheat, a swindler and a felon. It is supposed that there are some millions belonging to the late Confederacy deposited in the Bank of England, and Uncle Samuel is "after them."

The English vice-consul in Crete has been attacked by a fanatical Turkish mob, and there is talk of England seizing upon the island. A Russian force has crossed the Balkans at Etropol Pass. Suleiman Pasha has fixed his headquarters at Ichtiman, so as to bar all advance from the direction of Sofia. It is probable that Turkey will soon open direct negotiations for peace with Russia. After two cabinet councils the English ministry have resolved to insist on a voice in the settlement of the terms for peace. The British peace party are unusually active. The brave Roumanians are uneasy at the rumor that Russia will reclaim a strip of Bessarabea she was forced to cede at the close of the Crimean war. The King of Italy speaks forcibly on the necessity of having the army in good trim in view of possible complications.

FRIDAY, Jan. 4.—It is probable that some amicable arrangement will be made to heal the split in the Republican party. Several swindling bank directors have been indicted at Hartford, Conn.

Mouktar Pasha has arrived at Constantinople. Gen. Gourkha fought a severe battle at Tashesan on the 31st., losing 700 men, but forcing the Turks to retreat. He is following them closely to Sofia. Several other unimportant engagements.

SATURDAY, January 5.—There has been a severe storm, several shipwrecks and loss of life along the New England coast. The President says that on the whole he is quite content with the results of his policy, and will make no change in his administration. Collector Slade of El Paso reports that the San Elizario troubles were nearly altogether due to the conduct of Howard & Co.

Only 40,000 Turks have retreated across the Balkans; 70,000 more remain distributed among the fortresses of the quadrilateral. They will not attempt to defend Sofia. Erzeroum is now fully invested. Russia talks soothingly to England, invites a frank talk about difficulties, but declines mediation. England insists that she shall have a voice in settling the terms of peace. On this all the English Ministers are in full accord. Greece, too, looking to an acquisition of territory claims a voice in the settlement; but Turkey protests. Several Fenians have been released from prison. There is talk of holding the Conclave for the election of a new Pope at Malta, on the death of Pius IX.

SUNDAY, JAN. 6.—Chandler's charge against the President will probably be investigated. There is trouble between Diaz and our minister, Foster. Great destruction of property along the coast.

Russian reinforcements are constantly crossing the Danube, as if intended to oppose English forces in case of war, or else besiege the quadrilateral, Rustchuk, Silestria, Shumla and Rasgrad. TALK about peace. Gambetta's paper in Paris demands the removal of the present corps commanders of the army on the plea that they were unfavorable to the republic during the recent crisis. There is likely to be war between China and Siam.

MONDAY, Jan. 7.—The entrance of the Ellangowan Colliery, midway between Mahanoy City and Shenandoah, Pa., has been destroyed by fire, loss nearly $100,000, and compulsory idleness for about 300 hands. Pres. Hayes will make no more nominations for Custom-house officers at this city; so ends *that* fight between him and the Republican leaders. Commissioner Hoyt proposes to organize the best men among the Indians into a police force.

Gen. Radetsky is reported to have crossed the Balkans through the Shipka Pass, the Turks having previously abandoned their positions through extreme cold. Sofia was occupied on the 3d inst. by the Russians who only lost 30 men in a preliminary skirmish. Gen. Gourkha has had some fierce fighting at Bogrov, south of the Balkans. Turks repulsed leaving 1,000 dead. Muscovite loss 200. Both armies, but especially the Turks, are suffering terribly from cold, which is killing large numbers on both sides. France has been assured by England that she has no designs upon Egypt. The latter country has sent 5,000 more troops to Constantinople. Russia insists that Turkey must apply to her direct for terms of armistice or peace. The Turkish cabinet are at loggerheads; and the Grand Vizier threatens to resign. Germany and Austria have vetoed the opening of the Dardanelles to Russia only, hence the latter has abandoned the idea altogether. The king of Italy is dangerously sick. Gen. Grant is in Egypt.

HOME NEWS PARAGRAPHS.

In Waco, Tex., pecans sell at $2 per bushel.

The total State debt of Alabama is $9,705,676, and the interest is over $264,000.

"The Northwestern Traveling Men's Association" has 1051 members.

Nebraska raised the past year 25,500,000 bushels of corn and 170,500 hogs.

Song of the apiarist: "Let it ever so humble-bee there is no place like home."

An earthquake made its very unwelcome New Year's call on Virginia on the 2d inst.

The yield of gold and silver in the States and Territories during the year 1877 was $96,500,000.

Kentucky boasts another mammoth cave as big as the one already famous. It is in Wythe County.

This is the age of mire in the prairie regions of the West. But then mirages are not uncommon in that section.

Great Britain produces annually 160,000,000 pounds of wool, besides importing 360,903,270 pounds in addition.

Garland, Colorado, must be a nice, quiet town. It rang out the old year with four murders and rang in the new with one.

New York has paid off her entire bounty debt, amounting to $43,270,337.47, over ten millions of which were paid the past year.

The deaths in this city last year numbered 36,194, against 29,152 in the previous year. The returns show only 25,569 births.

North Carolina contains 1,025 distilleries, the largest of any State in the Union. Kentucky comes next with 754 distilleries.

The number of cattle in Great Britain has fallen off from 10,291,000 in 1874 to 9,734,000, and that of sheep from 34,822,000 to 32,220,000.

A Chicago man who attempted to eat forty quail in forty days, quailed on the sixteenth day and acknowledged himself a goose.

The champion corn shucker this time is from Dodge County, Nebraska, 2,300 bushels; time thirty-three days, and his name is William Dale.

The seventh annual meeting of the Wisconsin Dairymen's Association will be held at Whitewater on Wednesday and Thursday, Jan. 23 and 24th.

It required nearly 15,000 pounds of poultry and 5,000 pounds of oysters to feed the inmates of the public institutions of New York City on Christmas day.

A Maryland peach-grower is said to have shipped twenty barrels of peach kernels to Dayton, Ohio, recently, to be used for "chemical purposes."

The German Savings Bank of Lafayette, Ind., was one of the institutions that did not receive on New Year's Day. It is gone, but, unfortunately, not forgotten.

The highest price ever paid for a thoroughbred yearling is $30,000, Lord Lonsdale having recently given that sum for a brother to Doncaster, the Derby winner of 1875.

The gifts to our Government of articles from the Centennial Exhibition are estimated to be worth $1,000,000, and Congress is asked to provide a new building for their display.

Egypt has 765 non-navigable canals used solely for irrigation, and sixty-two canals used both for irrigation and traffic. Of these canals over 100 have been opened during the reign of the Khedive.

They have got a cotton compress in Texarkana that reduces a bale of cotton weighing four hundred and forty pounds, to a cubic foot in space. The pressure is two thousand pounds.

The New York Assembly of 1878 will contain 39 farmers, 24 lawyers, seven clerks, five journalists, four physicians, and an aggregate of 34 merchants, mechanics and business men, and 15 unclassified.

The imports of Great Britain for the first eleven months of 1877 show an increase of £16,756,000, or 4.9 per centum over those of the same period in 1876, while her exports show a decrease of £2,535,000, or 1.4 per centum.

During December 145 new publications were started, of which 101 were weeklies and 29 monthlies. During the same period the suspension of 51 publications was reported, 40 of them being weeklies. The new dailies number 13.

A steamer plying between San Francisco and Stockton keeps an eccentric and useful sheep on board. The sheep is trained to go out on a gangplank at a landing when a flock is to be loaded, to show that the approach is safe, and to act as a pilot.

The Chief of the Bureau of Statistics furnishes the following statement:—The United States exported in 1790, 144,734 pounds cheese; in 1800, 913,843; in 1830, 638,241; in 1840, 723,217; in 1850, 13,020,817; in 1860, 15,515,799; in 1870, 57,296,327; in 1876, 97,676,264, while in 1877, the total up to a date in December was 107,364,666 pounds. The total amount of cheese exported from this country from 1790 to 1877, both inclusive, was 1,262,952,571 pounds, or over 630,000 tons.

FOREIGN NOTES.

France has had ninety-four cabinet ministers since 1870.

In Great Britain there are 316 packs of hounds, or about 16,000 dogs in all.

Two Breweries, Bass's and Allsop's, in Burton-on-Trent, England, consume as much water daily as would supply a town of 45,000 inhabitants.

A Parliamentary document exhibits the fact of an increase in the exportation of literature. This year the quantity was 77,623 cwts., and the value £826,956, against £799,435 last year.

In Dublin, Ireland, market last month, butter sold as follows:—Firsts at twenty-eight cents per pound; seconds, twenty-six; thirds, twenty-four; fourths, twenty-two; inferior, eighteen to twenty-one.

Japan has 3,691 post offices, which distributed last year 24,000,000 letters and postal-cards and 5,000,000 papers. Postal-cards, stamped wrappers, money orders and savings banks are all included in the system.

Cooking by means of solar rays has been tried successfully at Bombay, India, and an apparatus has been contrived to cook chops and steaks in the open air as well and expeditiously as over an ordinary fire.

With regard to swine the United States head the roll of all nations with 671 per thousand of the population, followed by Spain Denmark, Austro-Hungary, Portugal, Germany, France, Russia, Great Britain, Sweden, Norway and Greece, in the order named.

An official document has been issued in England, showing an increase in the value of beer and ale exported this year compared with the preceding year. The value last year was £1,743,228, and this year £1,750,914. Australia took £453,884 worth of beer and ale.

The number of goats in Norway in 1875 was 323,364 or 179 per thousand inhabitants, as against 913 per thousand of the population in Greece, 279 in Spain, 233 in Portugal, 148 in Switzerland, 63 in Italy, 57 in Germany, 50 in France, 43 in Austro-Hungary, 27 in Sweden, and 8 in Great Britain.

The number of horses in Norway in 1875 was 151,903. There are consequently but 84 horses to every thousand inhabitants as against 227 in the United States, 225 in Russia, 176 in Denmark, 103 in Sweden, 98 in Austro-Hungary, 85 in Great Britain and Ireland, 82 in Germany, and 76 in France. The countries on the Mediterranean are still lower on the list, owing to their general employment of mules, asses, and draught oxen.

The value of the grain and flour imported into France in the first nine months of this year, was $26,200,000, as compared with $34,000,000 in the corresponding period of 1876. On the other hand, the value of the grain and flour exported from France, in the first nine months of this year, was $20,400,000, as compared with $19,200,000 in the corresponding period of 1876. The value of the live stock exported during the same period this year was $5,400,000, as compared with $6,400,000 in 1876; of eggs, in nine months of 1877, $6,240,000, as against $7,800,000 in the corresponding period of 1876.

The number of cattle in Norway in 1875 was 1,016,595, being 564 for every thousand of the population, a proportion exceeded only in Denmark and in the United States, where it is 687 and 651 respectively. Lower in the scale come Sweden with 482, Holland with 395, Switzerland with 388, Germany with 384, Austro-Hungary with 354, France with 325, Russia with 315, and Great Britian with 300 cattle per thousand inhabitants.

Norway had 1,636,806 head of sheep in 1875. The proportion per thousand of the population being therefore, 936, while it is 1,348 in Spain, 1,022 in Denmark, and 969 in England. Among countries where the proportion is less than in Norway, Greece has 818, the United States 808, France, 694, Portugal 676, Russia 647, Germany 609, Austro-Hungary 560, Sweeden 361, and Belgium 112,

Reliable help for weak and nervous sufferers. Chronic, painful and prostrating diseases cured without medicine. Pulvermacher's Electric Belts the grand desideratum. Avoid imitations. Book

and Journal, with particulars, mailed free. Address PULVERMACHER GALVANIC CO., Cincinnati, Ohio.

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Jan. 5, 1878

BEANS AND PEAS.—Receipts of beans past week, 9,150 bush.; same time last week, 8,432. Exports, 616 bbls.; since Jan. 1st, 616 bbls. Medium beans continue dull, and prices are drooping—$1 85 is now extreme for choice. Exportation has fallen off in marrows, and few new orders are expected. Prime, free on board vessels, $2.22½, which is lower. Pea beans quiet—must be extra to bring $2. White kidneys not moving. Red steady; buyers, however, seem supplied for the moment. Black or Turtle-soup beans, dull and easy. Canadian peas unchanged.

We quote:—Beans, medium choice, $1.85@1.85; other, $1.60@1.75; marrows, choice, $2.22@2.22½; other, $2.00@2.10; pea, $1.75@2.00. White kidney, choice, $2.00@2.25; other, $2.10@2.25; red, choice, $2,50; extra, $2 50; other, $2 25@2.35. Turtle soup beans, $1.75. Limas, $3.00. Green peas, $1.30@1. $1.35. Southern Black-Eye peas, per 2-bush. bag, $3.25. Canadian field peas in bulk and bond, 86c. for prime.

BEESWAX.—Trade is slow, and supplies fair, with prices easy. Sales at 27½@28c. for Western and Southern.

BROOM CORN.—Offerings are large, and demand is good.

Green brush at 6@7c.; green hurl, 6@7e.: medium green, 5@6½c.; red-tipped, 4@5c., and common red, 3@3½c.

BUTTER.—Receipts for the week, 15,050 pkgs. The market for State good to fancy grades, is firm; but trade is not quick and smooth, as holders seem aiming to force strong figures. This they are warranted in doing, as some of the best lines now coming forward have been bought high. Perhaps it would be better if even a slight concession were made to jobbers, as distributors want stock, but rather hang back when an upward tone is given to late prices. Holders, however, contend that a good many pet invoices now arriving cannot be replaced later on, and they will take the chances of their views becoming established. The general volume of local trade is better, being more winter-like, and a fair Eastern demand helps to enliven the market and reduce stock. Shippers have taken a few parcels of State; but what little is doing for export may soon be attracted to Western, as the latter quality is improving with heavier receipts. Western creamery has gone up to 3½c. for gilt-edged. Rolls are in fair demand

Comparative receipts and exports from June 1st to date:

	Receipts. pkgs.	Exports. firks.
June 1, '78	803 839	136,137
June 1, '77	841,202	95,142
June 1, '76	856 560	26,219
June 1, '75	662,441	30,324
June 1, '74	689,761	23,624

We quote State fancy pulls 28@30c.; other, 25@30c.; creamery, good to choice, 25@33c.; half tubs, selected 27 28c.; extra, 29@32c.; other, 21@25c.; Fall Welsh 28@28c.; Welsh tubs, prime, 27@29c.; other, 12 22c.; full dairies, fine, 26@27c.; common, 17@18c.; firkins 23@24c.; poor State, 12@18c.; Western creamery, good to choice, 35@37c.; poor to good 25@30c.; dairy tubs, best, 18@20c.; good, 13 20c.; other, 10@13c.; factory tubs, good to best, 13@21c.; common, 13@15c.; Western firkins, good to best, 10@12c.; other, 8@13c.; rolls, 12@18c.; grease, 6½@7c.

Exports past week, 809 pkgs.

CHEESE.—Exports for the week have been 31,600 boxes. This movement was much freer than expected about the holiday period, and prices have hardened. Some of the fancy lots have sold at 13½c, lines of several thousand boxes reaching that price, and from this quotation to 13@13½c. for average lots of fancy. The prices are:

Fancy factories, 13 13¾c.; good and prime, 12½@12¾c.; fair lots, 11¾@11¾c.; poor, 8@10c.: 7@10c., skimmed. Farm dairy, 11¾@12½c. for good to prime: 10@10¾c. for fair lots: 7@10c. for skimmed; Western factory, cheddar, 12¾@13c. for fine 10¾@11¾c. for good; 5@8c. for poor.

Receipts for the week, 20,450 boxes.

Liverpool cable, 63s. 6d. Gold closes 102.

The export demand is fully up to the expectation of the season. Fancy late makes are becoming scarce, and 13½c. is now quoted.

A recent estimation of stocks is given as follows by the Producers' Price Current: New York, 218,032 boxes; Philadelphia, 33,000 do.; Boston, 22,000 do.; London, 45,000 do.; Liverpool, 87,000 do.; showing no important variation compared with this date last year.

COMPARATIVE RECEIPTS AND EXPORTS FROM JUNE 1ST.

	Receipts, pkgs.	Exports, lbs.
June 1, '77 to Jan. 1, '78	2,159,799	89,460,618
June 1, '76 to Jan. 1, '77	1,855,318	73,426,279
June 1, '75 to Jan. 1, '76	2,131,548	79,240,404
June 1, '74 to Jan. 1, '75	1,811,612	81,337,155
June 1, '73 to Jan. 1, '74	1,869,680	77,642,179

COTTON.—There has been a more active export movement, with for future deliveries prices fluctuating sharply.

Latest prices are for January, 11.29@11.30c.; February. 11.42@11.43c.; March, 11.56@11.57c.; April. 11.68@11.69c.; May, 11.81@11.82c.; June, 11.93@11.94c.; July, 12@12.01.; August, 12.07@11.08c.

Quotations for spot cotton are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted.

	Uplands.	*Ala.*	*Orleans.*	*Texas.*
Ordinary	9¾	9¾	9¾	9¾
Strict ordinary	10 1-16	10 1-16	10 3-16	10 3-16
Good ordinary	10 5-16	10 5-16	10 7-16	10 7-16
Strict good do	10¾	10¾	10¾	10¾
Low middling	11	11	11⅛	11⅛
Strict low middling	11⅛	11⅛	11⅛	11⅛
Middling	11 5-16	11 5-16	11 6-16	11 7-16
Good middling	11 9-16	11 11-16	11 11-16	11 11-16
Strict good middling	11 13-16	11 13-16	11 15-16	11 15-16
Middling fair	12¾	12¾	12¾	12¾
Fair	12¾	12¾	13	13

Stained.

Good ordinary, 9 7-16c.; Strict ordinary, 10 1-16c.; Low middling, 10 5-16c.; Middling, 10 11-16c.

DRIED FRUITS.—Apples have a little freer inquiry and rule steady in price. Peaches are dull and unsettled. Blackberries and pitted cherries held firmly.

Apples—State quarters, old, 5¾@6¼c.; new, 6¼@6½c.; Western quarters, old, 5½@6c.; new. 6@6½c.; Southern, new, prime sliced, 6¼@7c.; fair to good, 5c. Peaches—Peeled, new, 11@12c.; unpeeled halves, 4¾ 5c.; unpeeled quarters, 3@4¼c. Pitted cherries, 16@17c. Blackberries, 9@10c. Raspberries, 27c. Plums, 10 16c.

EGGS.—Receipts for the week, 4,150 barrels. The receipts are large for the season, and immense for the rate of demand that exists. There seems to be no want that will induce buyers to take stock ahead; and then if there was, Western would miss some of it, owing to the pernicious practice of mixing old with fresh. When Western are guaranteed fresh, they sell as high as Southern. Limed eggs are dull; many lots are injudiciously restricted from placement by owners' limited prices.

Near points, 25@26c.; State and Pennsylvania, 23@24c.; Canadian 20@23c.; Western, best, 23c½.; other, 20@22c.; Southern, 20@23½c.; Limed, State, 17@18½c.; Canada, 16@18c.; Western, 15@17c.

FEATHERS.—Live white prime Western geese, 45@47c., mixed, 30@40c.

FISH.—Is in light receipt and higher. Sales of 40 pounds ave. $21.00@22,00; 50 pounds ave. $20@21; 80 pounds ave., $20@21; 100 pounds, $21@22; and rye at 18@20.

FLOUR.—The business since the first of the year has been very light, while receipts have been large and the position of wheat values unsatisfactory; consequently, there is a slight decline in prices.

Latest prices are $4.75@5.25 for poor to fancy superfine State; $5.35@5.60 for common to fair extra do. $5.60@6 00 for good to choice do.; $4.75@5.25 for superfine Michigan, Indiana, Iowa, &c., outside for choice; $5.30@5.60 for shipping extra do., the inside price for poor, and $5.70@6.00 for good to strictly fancy extra do.; common to choice white wheat extras, $5.85@7.25; fancy do at $7.25@8.25; red and amber winter wheat, good to choice family, at $5.65@7.25; round hoop Ohio at $5.40@5.75, and trade brands of do. at $5.80@7.00, the latter for choice; St. Louis, $5.60@6.35 for poor to fair extra and $6.35@7.80 for good to fancy, (with a few brands of very fancy quality quoted up to $8.25@8.50); Minnesota clear, $5.50@6.75; Minnesota "straight," common to fancy, at $6.25@7.75, and patent poor to very choice, $7.00@9.25, with a few fancy at $9.50@10; unsound stock at $3.00@6.50; city mill extra at $6 20@6.50 for fair to very choice for West Indies; do. for England $5.45@5.70; do. trade and family extras, $6.50@7.75; do. South American, $6.60@7.50; No. 2 at $4.00@4 25.

Buckwheat flour, $2.40 for common; fancy, $2.75.

Corn Meal is selling at $2.60@3.00 for yellow Western, and $3.25 for Brandywine.

FRESH FRUITS.—Exports apples past week, 1,769 bbls. Dealers are re-sorting tender varieties of apples. Fine winter sorts that have stood the trying weather, are held very firm; poor or damaged stock is offered low, and sometimes the buyer makes the prices. Cranberries are quiet, as retailers stocked up pretty freely during the holidays. Grapes begin to run poor. Florida oranges have lost their special demand. Light receipts of peanuts and fair demand. Hickory nuts dull.

We quote Baldwins, $3.50@3.75; Spitzenbergs, $4 00@4.50; Russets and Greenings, $3.25@3.75; prime sweet, $3.25@3.50; Seek-no-further, $3.75; Newtown pippins for export, $7@8; Lady apples, $8@15. Fine Grapes—Catawba, 5½@6½c.; soft berries, 2@4e.; Isabella 2@4c. Cranberries, bbls., $4@7.50; crate, choice, $2@2.25, good, $1.75; poor, $1 a 1.50. Peanuts, $1.45@1.50. Hickory nuts, 75c.@$1 bush. Texas pecans, 8@9e.

FURS AND SKINS.—Market quiet and nominal. There are no encouraging features here or abroad,

	No. 1 quality. Nor. & East.	West & N. W.
Otter, ₱ piece	$3 00@4 00	$2 00@2 50
Gray Fox	40@ 45	40@ 45
Red Fox	75@ 80	60@ 65
Black Bear	5 00@6 00	4 00@5 00
Brown cubs and ylgs.	1 00@2 00	1 00@2 00
Florida deer skins.	15@ 18	
Fisher	5 00@6 00	4 00@5 00
Mink, dark	85@ 90	50@ 60
pale	50@ 60	30@ 40
Muskrat, winter	8@ 10	6@ 8
fall	6@ 7	4@ 5
Kitts	@ 2	@ 2
Beaver, ₱ ℔	1 60@1 25	60@ 75
Raccoon	35@ 45	35@ 45
Opossum	3@ 6	3@ 6
Skunk, black		40@ 45
striped		5@ 20
Wolf, mountain		1 50@2 00
prairie		50@ 60

GRAIN.—In wheat there has been very little done for export, and prices have declined.

Latest sales are of No. 2 red at $1 18@—ungraded red and amber State, $1 53@1 55; white, $1 56; No 1 Northwest spring, $1 40; No. 3 Chicago, $1 27½; No. 2 red for January at $1 32; No. 2 Milwaukee spring, $1 38. Rye is a trifle steadier; sales of Western at 74@7 c.; State at 75@77c. Barley, 85c for No. 1 Canada; 75@79c. for two-rowed State. Corn is weak and quiet. Latest sales are of New York No. 2 at 63¾@63¾c.; steamer mixed, February, 53@59c. Oats of New York extra white, at 41½c.; do. No. 1, January, 40c.; No. 2 white, 39½@40c.; mixed Western, 37½@39½c.; white Western, 38¾@40c.

HAY AND STRAW.—For prime hay there is not much inquiry, but shipping lots have a fair sale, and prices generally unchanged.

Bale hay, 65c. for shipping, and 75@85c. for retail qualities; clover, 40@50c. for prime. Straw, 50@55c. for long rye; 40@45c. for short rye, and 40@45c. for oat.

HIGHWINES are lower—$1.09.

HONEY.—The market looks blue for honey. There are sellers of white clover comb at 15c.; dark, 10@12c.

HOPS.—Exports for the week have been 2,500 bales: since Sept. 1, 43,700 bales, against the same period of the previous season, 20,700 bales. There is an active market, the demand being mainly for fair to low grades. Choice are getting scarce, and on urgent orders outside prices are excelled.

State choice to fancy, 11@13c.; do., low and fair, 5@7c.; Eastern, new, 8@12c.; Wisconsin, do, 5@8c.; Yearlings, 3@5c.; Olds, all growths, 2@3c.; Californians, 12@14c.

LEATHER.—Hemlock sole, 21@22½c. for light, 22@24c. for middle, 22@24c. for heavy, 20@21½c. for good damaged.

OIL-CAKE.—Western is offered at $32.50 ₱ ton.

POULTRY AND GAME.—Live poultry seldom has so good a winter sale as at the moment. Arrivals of dressed have been undecided since New Year's, and some positive buyers have called pretty regularly upon city killers.

N. J. chickens, 9@10c.; fowls, 10@12e.; Turkeys, N.J., 11@13c.; Ducks, N. J., pair, 60@$1; Geese, N. J., $1.50@1.75; Western, $1.12@1.37.

Dressed poultry has sold up to 18c. for turkeys and 17c. for chickens, but as soon as there was any evidence of of fair supplies the market dropped to our annexed quotations, which are now full, although the weather is favorable. Large turkeys sell at a loss. The poultry trade is apt to have a lull after New Year's, but its light use in December may help our trade now, if prices are kept popular.

Fancy Phila. and N. J. turkeys, 15@16c.; good, 12@13c.; large, 10@11c.; chickens, choice, 15c.; good, 12@13c.; common, 9@10c.; ducks, choice, 15@16c.; other, 11@13c.; geese, fancy, 12c.; other, 8@11c.

Game has improved with the weather, and a light supply is bringing high prices. The unsold venison will not be interfered with, though its sale limit expired Jan. 1st. There were about 3,000 saddles and very few whole deer. Quail are above the reach of ordinary buyers.

Hares, pair, 25@35c. Black bear, 25c. carcass. Canvas-back ducks, $2.25@2.75; Red-heads, 75c.@$1; Mallard, 65@75c.; Teal, 40@50c.; common, 25@35c. Quail, prime, $2.75@3; soft, $1.50@2. Partridges, pair, 75@80c.; soft, 40@60c. Grouse, $1; soft, 75c. Rabbits, 30@35c. Hares, 20@40c.

PROVISIONS.—Hog products have been depressed and lower. Mess pork $12.40@12.50 for spot lots $12.40 for January, $12 50 for February and $12.50 for March. Bacon at 6¾@—c. for long clear and 6¾c. for short clear. Lard—Western steam at 8-85c. for spot, 7-95c. for January, 8c. for February, and 8.10c. for March. Tallow, 7 9-16c. for prime. Stearine, 8c. for prime Western. Beef hams at $16.50. Beef—New extra mess, $13@13.50; plain, $11@12.50; new packet, $14.50; family mess, $16@17; extra India mess, $25 25.50 for city brands; do. Philadelphia, $23 50@24.

SALT.—Ashton's at $2.50; Higgins', $2.50 and other sack lots at $1.10@1.15.

SEED.—Grass are lower: clover 8@8¾c. for prime, timothy, $1.37½@1.40.

TOBACCO.—There is a good export and fair home trade demand and prices strong.

VEGETABLES.—Exports of potatoes past week, 6,769 bbls. The market is quiet, and were it not for the improved weather, prices would be hardly supported. Many onions have become badly damaged; our rates are extreme for wholeo. Squash and cabbages have advanced. Among the arrivals are California cauliflowers, $6@10 per case of 30 or 10 heads; a few boxes of Bermuda tomatoes, $3 ₱ box; hot-house radishes, $3.50 ₱ 100 bunches; lettuce, 40@60c. ₱ doz., and cucumbers, $4.50@5 ₱ doz.

We quote Peach Blows, $1.75@2, bulk and double-heads. Early Rose, $1.75@1.87; Peerless, $1.25@1.50; Nova Scotia, $1.50@1.75; Sweet, $1.50@2.50. Cabbages, 100, $2.00@3.50; red, 3@4. Marrow squash, bbl., 75@87c.; Hubbard do., $1.25@1.50. Russia turnips, 75@87c. Carrots, 75@87c. Beets, bbl., 75c.@$1.00. Red and yellow onions, $1.00@1.25; white, $1.25@1.75. Pumpkins, ₱ 100, $4@7; extra, $8@8. Celery, doz., 75c.@$1.

WOOL.—The market has been quiet as yet this year but holders look for a revival of demand shortly and name stron prices.

Ohio, Pennsylvania and Virginia—XXX and picklock, 47@50c.; XX, 44@47c.; X, 42@45c; No. 1, 43@46e; No. 2, 38@40c.; common, 35@37c.; combing, 5?@54c.

New York, Michigan, Indiana and Wisconsin—XX, 39@42c.; X, 37@41c.; No. 1, 40@43c.; No. 2, 35@37; common, 34@36c.; combing, 50@54c.

Iowa, Vermont and Illinois—X and XX, 35@38c.; No. 1, 37@42c.; No. 2, 36c.; combing, 48@52c.

LIVE STOCK MARKETS.

NEW YORK, Jan. 7, 1878.

BEEVES.—Receipts for the week, 8,095 head; do. last week, 6,141 do. The market has been steadily active, the entire supply having been closed out before Saturday P. M. A few cars were due for the early trade and they will meet a bare market. Closing rates show a slight advance for the week. Extra quality steers sold at 11@11¼c.; medium to good, 8¾@9¾c.; prime, 10¼@10¾c. For export a number of prime fat steers were received.

The annual receipts of beeves, hogs and sheep at the Union Stock Yards at Chicago for the last twelve years, as published by the Live Stock Reporter, were as follows:

	Cattle.	Hogs.	Sheep.
1877	1,023,151	4,025,970	310,746
1876	1,036,745	4,160,906	364,035
1875	920,843	3,912,110	418,948
1874	843,906	4,258,379	338,155
1873	761,428	4,537,760	291,754
1872	684,075	3,252,623	310,211
1871	542,050	2,380,683	317,053
1870	532,964	1,603,158	349,855
1869	403,102	1,661,869	300,072
1868	324,521	1,706,782	270,875
1867	393,007	933,233	209,737

COWS AND CALVES.—Market quiet; only choice milkers selling. These, when up to the ideas of purchasers, bring $60@70 ₱ head.

VEAL CALVES.—Arrivals of prime live are light, and sales have been quick at 7½@8¼c. for good to choice. These include best N. J. and some river stock. Hog-dressed veal 10@12½c., with a fair sale at West Washington Market.

SHEEP AND LAMBS.—Receipts for the week, 14,366 head; last week, 10,952 do. Trade was moderate; some stock detained. This State sheep sold at 5¾c. ₱ ℔.; from that down to $4.80 ₱ 100. Lambs, 5¾@7c. Mixed sheep and lambs, 6¼c.

SWINE.—Receipts for the week, 26,100 head; do. last week, 29,203. No quotable sale at the close, as a train was behind time and no new prices obtainable. A late quotation was 4¼@4¾c.

THE superiority of **Burnett's Flavoring Extracts** consists in their perfect purity and great strength.

New Advertisements.

***THE HAIR** is Rendered Soft and Pliable, and its vigorous growth promoted by the timely use of Dr. Jayne's Hair Tonic. Being a good dressing for the hair, and an excellent tonic for the scalp, any one threatened with baldness should give it a trial.*

A $9.00 BIBLE AT $4.00.

TO BE READ CAREFULLY BY ALL LOVERS OF

THE WORD OF GOD

SENT FREE. DESCRIPTIVE CIRCULAR. A HANDSOME NEW YEARS PRESENT.

Office of the AMERICAN FAMILY BIBLE PUBLISHING CO., *Cincinnati, O., Oct. 1, 1877*

WHEREAS, The American Family Bible Publishing Company, having been organized for the manufacture and sale of Family Bibles and other Religious Publications, and as the sale of its other publications has made the Company self-sustaining, be it therefore

Resolved, That in future our general and branch offices are hereby instructed to sell our line of new and improved Family Bibles at such prices as will cover cost of manufacture.

Pursuant to above instructions, we are now filling orders for our NEW AND IMPROVED $9.00 BIBLE AT $4.00, AND OUR $15.00 BIBLE AT $6.00, which, in addition to the **Old and New Testament** and Apocrypha, contains NEARLY

2000 ILLUSTRATIONS,

AND OVER 100 ADDITIONAL FEATURES. AMONG WHICH ARE A BIBLE DICTIONARY, HISTORY OF THE BIBLE, LIFE OF CHRIST, LIVES OF THE APOSTLES, HISTORY OF RELIGIOUS DENOMINATIONS, CITIES AND COUNTRIES OF THE BIBLE, ANIMALS OF THE BIBLE, EASTERN MANNERS AND CUSTOMS, PHOTOGRAPH ALBUM, MARRIAGE CERTIFICATE, AND FAMILY RECORD.

STYLES, PRICES, AND CONDITIONS.

This splendid **Royal Quarto Edition** of the Bible is made self-explaining, being a complete Library of the **Holy Scriptures.** The amount of matter (extra) aside from the Bible proper, if bound in separate volumes, would cost $20.00. These Bibles are printed with a clear and large type on paper of first-class quality. The bindings are of the most durable and attractive character. Size 10½ by 12½ inches.

STYLE A. American Morocco, Crushed Panel, Gilt Centre Stamp, Marbled Edges, nearly 1200 Illustrations, 1130 Pages, **$4.00**

STYLE D. French Morocco, Raised Panel, Gilt Centre Stamp, Gilt Edges, Photograph Album, nearly 2000 Illustrations, 1400 pages, Superb Extra Presentation Edition. **$6.00**

NOTE THESE INSTRUCTIONS. Bibles can be returned and money will be refunded, if purchasers are not satisfied. Give *Full Name, Post Office, County, and State*; also, nearest *Express Office*. The safest *manner to send money*, is by Post-office Money Order, or Registered Letters. Address all communications to
AMERICAN FAMILY BIBLE Publishing Company, No 178 W Fourth St., Cincinnati, O.

☞ We will send either of our Bibles, C O.D., with privilege of examining, on receipt of ONE DOLLAR. ☜ Cut this out, as it appears but once. ☜

A $15.00 BIBLE FOR $6.00.

Reading for the Young.

TO MY OLD JACKKNIFE.

RUNE BLUFF.

O GLAD the day, my old Jackknife,
When first I owned you bright and new!
Your glittering beauties to display
Unto my chums I fairly flew.

My bosom swelled with boyish pride
As in my pocket's depths you lay,
I turned you o'er a thousand times,
While morn at school dragged slow away.

I whittled notches on my desk,
And carved my name upon the seat,
Hiding the scraps upon the floor
Till recess-time, beneath my feet.

I notched my hat all round the brim,
And strangely short my pencils grew,
My slate-frame had a warrior's look,
With scars and scratches not a few.

My dog's-eared books were smoothly trimmed,
Corners and edges, round and square;
I carved out "Minnie" on the door,
And watched to see her read it there.

But now, old knife, you're sadly changed,
Your blade is broken at the point,
Your youthful glitter all is gone,
Your back is nearly out of joint.

But though your useful days are past,
I'll keep you for the joy you gave,
And for your service you deserve
The rest and glory of the brave.

THE JANITOR'S VISIT.

BIVALVE.

THE janitor of Rocky Mount Academy is a queer fellow of eighteen; he is fond of playing his jokes and strategies on every inmate of the school—pupils and professors.

Without stopping to enumerate and speak of the many pranks that he has played, I will tell you about the one which has lately occurred.

It was Friday afternoon,—the day for "speaking" and compositions,—and the school had fairly entered into the exercises, when there appeared at the school-room door a gentleman, who, upon entering, said, "I thought I would drop in for a moment or two, to see how the school was getting along, and so forth, and, if it is agreeable, would like to hear the boys recite in the var'us exercises."

The visitor occupied a seat on the platform, and apparently conducted himself with much dignity. The boys eyed him with suspicion, as if he weren't an altogether *new* visitor, and gave vent to their merriment over his appearance in a general titter, which ran around the class.

All this the new comer did not seem to notice, but clearing his throat with a loud "Ahem!" pulling his ponderous overcoat around him, and unloosing his scarf (which garments, together with a false mustache, concealed his features), requested the teacher to be so obliging as to have a recitation in Algebra, putting on a sober look and with a wrinkled forehead.

The Professor obligingly consented, and designating one boy from each of the five long rows of seats to go to the blackboard, he gave out the problems, to the explanation of which the visitor seemingly gave good attention.

After other short exercises, the Professor called upon the visitor to "make a few remarks," and, amid the jollity of the pupils, in a manly tone, with stiff neck and head high, he began and ended thus:

"MY YOUNG FRIENDS AND MR. TEACHER:—I thought I would jist drop in, this afternoon, and see how you all was gittin' along. I have been pleased with the exercises in all the different branches of mathematics, and 'specially the Algebra. Allow me to say, my young friends (raising himself on his toes and coming down on his heels), that you should have the opportunity you improve; or, I mean to say, you should improve the property you have; or, any way, you know what I mean (general laughter and applause). I say—" but just then the stove-pipe fell, and all hands rushed to catch it.

The Professor told one of the boys to tell the janitor to come in at once; but, after much searching, nowhere could that individual be found, and when the boy, who was commissioned to find him, entered and so informed the Professor, the visitor capped the climax by remarking:

"Mr. BOOTH (the teacher), just lend me your ears for a moment: you've been thinking, all the time, that I was your friend SMART, from up the road, but you're mightily mistaken. I am nothing more nor less than DIDYMUS EGO GREEN, the janitor of this school." And so saying he dashed out of the door.

Mr. BOOTH, though entirely surprised, joined in the chorus of laughter that ensued, and regretted that he had stopped the regular recitations on account of that tricky janitor's entrance.

THE RAIN-DROP.

ONE summer morning a drop of rain hung on a thorn hedge. The sun was shining brilliantly overhead, and as it glittered on the globe of water, the water-crystal reflected back a stream of light. It was a borrowed splendor, like the brightness of the moon; and whilst it shone in its glory, the rain-drop thought, "Would I were always as brilliant as I am to-day! I should then be admired and prized as no one ever prizes or admires me now. I am so small that I am useless, and before an hour is past I shall have been dried up by the sunshine. If I could do some good, I should not so much mind losing my present splendor."

The rain-drop was right. Before an hour was past away, the sunshine had dried it from off the hedge, and changed it into a light vapor. All the day it floated through the air, unseen by human vision, wafted as it seemed upon the wings of some playful breeze, until towards the evening it found itself resting on the bosom of a dry and sandy plain. There was but little verdure in the place, and as far as the eye could reach, the country seemed parched and barren. As the vapor thought of its hard lot, it sighed and said, "At last I shall be altogether lost. I shall sink into the sand, and become as useless as the pebbles that lie upon the plain."

But in this it was mistaken. When the sun had set, and the surface of the little herbage there was in the desert had become cool, the moisture in the atmosphere began to condense upon all the vegitation it met with. Now it happened that a tiny plant, with downy leaves and sky-blue blossoms, grew near that spot. All day long it had been exposed to the blazing sunlight, and when the evening came its leaves hung down, and it seemed likely to die. Before long, the vapor of the rain-drop passed near it, and meeting with its cold stalks and tuft of flowers it was condensed, and became a number of little beads of dew. The flower drank the cooling water with delight, and began to recover its strength, and so was able to resist the heat of the following day. And more than this: the plant of the desert yielded a famous medicine; and no long time passed away before it was gathered by a herbalist, who dried it carefully, and sent it to a distant land to be used by the physicians in curing the diseased.

There it was the means of saving a great man's life. He was suffering from a dangerous illness, and it appeared as though all human aid would be of no avail. But some one recommended him a tincture made of the desert plant; and after he had taken it he began slowly but surely to recover his strength.

Thus, had it not been for the rain-drop, a valuable life would have been lost. Such power is often found to be associated with little things.

"I have no influence," says one; "if I had power, or wealth, or beauty, I might do good."

But remember all may help to do a little, even if they cannot do much. He who speaks a kind word may gain a soul, and he who saves "a soul from death" "shall hide a multitude of sins."

LETTERS FROM BOYS AND GIRLS.

A Co-Partnership Letter.

"DEAR COUSINS:—We, two girl chums, enjoy reading the Boys' and Girls' letters very much, and thought we should like to try writing to the RURAL for a novelty.

We girls having known each other all our lives; (there being but little difference in our ages), been in the same school, studied and sat together, have now decided to write a partnership letter to you. Now, introduction is ended, we will tell you about our club composed of eight girls, to which we belong.

This is called the E. E. C., or East End Club. The boys, in opposition to us, organized a club also, the title of which is the B. O. T. We girls never could fathom the meaning of this, it being too deep (?) for girls' wits.

We have two methods of initiating our members, the mysteries of which awful performance will be given at a later date. At one of our meetings when several of the girls were being let into the secret of our society, we suddenly heard a tapping at the window, and rushing to it we caught a glimpse of the Honorable (?) members of the B. O. T. hastily retreating behind the grape-vine arbor.

Now, dear cousins, we have told about our "club," and hope to tell more about our home amusements some other time. Also would like to read an account of yours.

We hope Mr. Editor will not consider this letter so long that it will be slipped into a corner of his waste-basket instead of his paper.

Indiana. KATIE & SUSIE.

About Two Little Girls.

DEAR UNCLE TRUE:—I would like to tell you something about two little girls who have been visiting at our house. Their names were LIZZIE and ANNIE. LIZZIE was all love and kindness, while ANNIE tried to make herself just as disagreeable as possible. Everything that was given her she would take in such a matter-of-course way that we all soon got tired of doing anything for her. You never heard "Thank you," come from her lips, in fact, all that did come from them, was haughtiness and pouting, but LIZZIE was not so. It was a pleasure for you to give and get all you could to amuse and please her; she was all smiles, and did all she could to return your kindness toward her. It is needless for me to say there was a great difference in bidding LIZZIE and ANNIE good-bye when they left us. LIZZIE left an impression with her memory never to be forgotten, while ANNIE no one cared to remember.

Oh, my dear cousins, let us all remember that the spirit of love and kindness will always gain for us friends and acquaintances, while that of haughtiness and pride will make for us enemies. Which shall we try and cherish?

A RURAL COUSIN.

Another Reformer.

I DID not think, of becoming one of the brigade of the RURAL, cousins till I read MADCAP MOLLIE'S letter. It inspired me with zeal to write.

Hurrah for Mollie! Go ahead, and may success attend your efforts. May every young Miss sign your pledge, and keep it. And soon there will be fewer dissipated young men. But, boys, don't let us permit the girls to lead us. While they are getting signers to their pledge, let us get signers to a pledge that we will not go with any girl, who laces, or,

Who ought to wear shoes number four,
Yet tortures herself with twos,
And onward goes with a Boston limp
And the grace of the Kangaroos.

WILD FIRE. *Elk Valley, N. Y.*

The First Attempt.

UNCLE TRUE.—This is my first attempt to write to your valuable paper. I shall be encouraged if my letter is published. I would be much obliged to any of the Cousins who will give me the best plan to trap squirrels alive. I must not make my letter too long or else it may get into that big basket. YOUNG CANADIAN.

P. S.—I do not wish to hurt the squirrels.

The Puzzler.

ILLUSTRATED REBUS.

☞ Answer in two weeks. H. W.

DOUBLE ACROSTIC.

CAROL, ye birds, your sweetest lay,
And sing the bright sun's praise;
Unfold your leaves, ye little buds,
To greet his welcome rays;
And, Fashion, lead thy votaries back
Again to Pleasure's sphere,
Where they are wont to pass a few
Gay months in every year.

Beneath the green trees' chequer'd shade
She dwelt in some fair sylvan glade,
And oft upon the flow'ry mead
Danced to the music of a reed.

'Twas somewhere in "the good old days,"
When George the Third was king,
That all the goodly gentlemen
Thought this was quite "the thing;"
Then it adorn'd the choicest beaux and wits,
And often, too, would decorate "the cits."

It is a woman's hand that must
The regal scepter hold;
It is a woman's brow must bear
The crown of gems and gold.

The old tradition fails to tell
How long ago they made
The ancient edifice that casts
Thy sliver in the shade.

Long since he died, and left behind a name
(Oh what a priceless legacy for Fame!)
That ne'er was for a single virtue known,
But celebrated for its vice alone.

It used to guard the mines of gold,
And to no foes would yield;
They blazon now its image on
The bright heraldic shield.

☞ Answer in two weeks. EUREKA.

PUZZLER ANSWERS.—Dec. 29.

ILLUSTRATED REBUS.—Not for Joseph.

DOUBLE DECAPITATIONS.—1, Slash, lash, ash; 2, Wheat, heat, eat; 3, Shear, hear, ear; 4, Malice, Alice, lice; 5, Mowing, owing, wing; 6, Spawn, pawn, awn; 7, That, hat, at.

ANAGRAMS—STATESMEN AND PATRIOTS.—William Ewart Gladstone; 2, Lord Brougham; 3, Earl of Derby; 4, William Pitt; 5, Sir Robert Walpole; 6, Earl of Chatham; 7, Henry Grattan; 8, George Washington; 9, General Grant; 10, William Tell; 11, Daniel Manin; 12, Andrew Hofer.

DOUBLE ACROSTIC.—Initials, Gin; finals, Rum.

Sabbath Reading.

LIFE LESSONS.

WHO loses self in brotherhood
Forth-giving ever gathers good;
And who for truth or right would die
In falling gains the victory.

The spirit wrought to noble aim,
The thought that sets the mind aflame,
The faith that wins in deadly fight—
Forgetting self, have greatest might.

So wisdom centers at the heart,
Like subtle sense that every part
Moves unperceived in perfect health;
And knowledge thrives in larger wealth.

Set chiefest to the soul perplext—
By doubt or wayward evil vext—
Oppressed with woes or worn with strife,
This whisper opes the gates of life:

Not what thou art, but what he is
In whom thou livest, makes thy bliss;
Count self and its searching loss
Before this wisdom of the Cross.

NOT IN VAIN.

THERE are a great many persons who are discouraged because the labors that they have most honestly undertaken for the good of men seem to have been utter failures. Some of our labors are failures; it is not to be supposed that we are such deft marksmen that we can strike the mark every time. But do not think that you have failed simply because you do not see the result of your work. Men are like apple-trees; some apple-trees ripen their fruit in July: while the fruit of other trees goes on growing and growing, and growing, through August and September; and in October the farmer picks it off, and then it is green and hard; and he keeps it through November and December and January, and into February, when the snow is knee-deep, and the tree has lost its leaves, before it is thoroughly ripe. And many of you are just like these late-bearing trees; you are bearing good fruit; but it will not be ripe till you have shed your leaves and gone into your winter. So be patient!

If there was ever a man who seemed to spend his life for nothing, it was Henry Martyn—a man of an exquisite nature, great power, and a sweet and loving disposition. Taking the highest honors and having the best prospects, he was led by the Spirit of God to consecrate himself to the cause of foreign missions. For that object he sacrificed that which was dearer to to him than life; for she to whom he was affianced declined to go with him. He forsook father and mother, and native land, and love itself, and went, an elegant and accomplished scholar, among the Persians, and spent a few years almost without an apparent conversion. Still he labored on, patient and faithful, until seized with a fever, he staggered. And the last record that he made in his journal was that he sat under the orchard trees and sighed for that land where there should be sickness and suffering no more. The record closes, he dies, and a stranger marks his grave.

A worldly man would say, "Here was an instance of mistaken zeal and enthusiasm; here was a man that might have produced a powerful effect on the Church and in his own country, and built up a happy home, and been respected and honored; but under the influence of a strange fanaticism, he went abroad and sickened and died, and that was the last of him." The last of him! Henry Martyn's life was the seed-life of more noble souls perhaps than the life of any other man that ever lived. Scores and scores of ministers in America, who have brought into the Church hundreds and thousands of souls, and multitudes of men in heathen lands, all over the world, have derived inspiration and courage from the eminently fruitful, but apparently wasted and utterly thrown away life of Henry Martyn. And are there not some of you, that are despondng because you do not see the fruit of your labors, who will receive consolation from, and be revived by, such an instance as this? HOPE.

HOW ABOUT OUR FAITH.

Is faith an essential element in order that we may live a Christian life, and do a Christian work?

We undoubtedly need a fixed principle as a foundation for that work. Method, and a tenacious clinging to that method, may be right and perhaps that very firmness may many times carry us through strong temptations; but though the forms of work may go on, is there not danger right there, if resting too much upon our good works, or if allowing the form and order and method to usurp the place of life. Spurgeon says "I have seen a church carried on by dead men, a dead man in the pulpit, dead men in the Sabbath-school, and dead men in the prayer-meeting."

Is it not sometimes the case that our Christian work goes on after we have lost, in a measure, the living faith and earnestness we ought to have. The steady flame, that burns right on without flickering is well; only let us know of a surety, that we have faith so wrought with our works, that, like Abraham of old, by our works, our faith may be made perfect.

RAY HULBURT.

THE soul shall hear good news from heaven when it is waiting at wisdom's door.

PERSONAL ITEMS.

Mr. Tilden will spend a part of the winter in Georgia and Florida.

On the 1st of January, General Whiskycocktailiski was temporally superseded by General Swearoff.

A farmer, on the fever and ague marshes of New Jersey, has named his daughter "Malaria." She will doubtless be "great shakes" of a girl.

Grant (to Vesuvius)—Do you object to smoking? Vesuvius—Oh, no; not at all. Smoke away. I like it. I'm an incorrigible smoker myself. Puff!

John B. Hartiz of St. Louis, eighty-six years old, and totally blind, teaches music and dancing. It is cheering to see so old a man so young in action. Hartiz in the right place.

Dr. McMurtrey has resigned his position as chief chemist of the Department of Agriculture in order to represent the interests of the Department at the Paris Exposition.

Mr. Evarts compares himself to the Connecticut farmer's stone wall, which was built four feet high and five feet thick, so that if it was blown over it would be higher than before. "I have been patient enough," he says, "to come here on a salary of $5000 a year, and if I am tipped over, I will go back to a practice of $10,000 a year."

It is said that Osman Pasha was a close student of the campaigns of Gen. Lee and Gen. Joseph E. Johnston, and that he had all their reports and descriptions of their military movements translated specially for him; that he delighted to comment on "Stonewall Jackson," and spoke eloquently of Sheridan. But Lee and Johnston were his models.

A picture of Prince Albert and his eldest daughter, then just betrothed crown princess of Prussia, is given in his own words: "I am giving Vicky, every evening, an hour for conversation, in which our chief topic is history. She knows a great deal. I also give her subjects which she works out for me. Her intellect is quick and thoroughly sound in its operation."

Judah P. Benjamin, formely a member of the Confederate Cabinet under Jeff Davis, and now one of the leading lawyers at the London bar, while pleading, began an argument with the adjuration: "In the name of Heaven—" The Master of the Rolls instantly stopped him, saying very quietly: "I do not see that Heaven has much to do in this case, Mr. Benjamin; the proper appeal is to the appellate court."

General "Bob" Toombs, of Georgia, is described as the possessor of a figure that is a model of manly strength and beauty, and a head that Nature left rough-cast. Grizzled, unkempt locks are piled in disorder over and around his broad, high forehead, and the dark skin of his massive features is plowed by deep lines. When excited, his eyes glow, his arms are thrown rapidly and forcibly about, and he speaks in a high, sharp voice.

When Mark Twain lectured recently at a town in Massachusets it was arranged that T. B. Aldrich, the poet, should introduce him. When Mr. Aldrich was about to step forward to perform his duty, Mark checked him. Then advancing slowly to the edge of the platform, while the amazed poet resumed his chair, the humorist remarked: "Ladies and gentlemen, my friend Mr. Aldrich was going to tell you who I was, but I would rather not—he knows me too well."

The Czar of Russia was at Intchenitzer when an officer of the Uhlans brought the news of the fall of Plevna. His Majesty is said to have replied, "But the war is not over, for all that." The Emperor went to the army, greeted the troops, and kissed Prince Charles, calling him cousin. He then embraced Todleben, the chief of the staff, Imeretinsky and Granetzky, commanding the Second Corps, saying to them, "This is all due to you; above all to thee, Edward Ivanhoff Todleben."

A Washington correspondent says Hayes has grown fleshy since his election and his face is that of a man at peace with his dinner and the world. There is a look of greater refinement, too, about him than there was two years ago, as though he were accustomed to better society as President of the United States than as Governor of Ohio. He appears to have lost a certain awkwardness of manner that characterized him then, and his relations with his hands and feet are far more amicable than they used to be.

This is related of the late Mrs. Gen. Hooker: When she was the admired Miss Groesbeck of Cincinnati, she was once at an evening party, when a fashionable young dandy was asked if he would like to be presented to her. "Oh, yes," said he languidly, "trot her out." The lady overheard the remark, and when he was presented, she adjusted her eye-glasses deliberately, and slowly scanned his clothing from boot to collar. The survey finished, she waved her hand and carelessly said, "Trot him back; I have seen all there is of him."

Real Estate.

LANDS Central-Western **IOWA**

J. B. CALHOUN, *Land Commissioner.*

PARTICULARLY
FOR THE LADIES!

THE RURAL NEW-YORKER, at the instance of Miss FAITH RIPLEY, conductor of the Department "For Women," offers, as one of the most valuable and acceptable Premiums of the season, a Steel-Plate Engraving, size 24x32.

The subject,

"OUGHT AND CARRY ONE,"

portrays a pretty young girl, gracefully poised, and holding pressed against her side, a slate on which she is "doing sums." The contracted brow, puzzled expression and drawn corners of the mouth, express most comical dismay.

This charming picture is printed from a new plate, the lights and shadows are clearly defined, and this work of art, when nicely framed, is a decided ornament.

Nothing is more refining and elevating than *good* works of art, and we confidently proffer this as something greatly in advance of anything heretofore announced.

We anticipate that this offer will appeal especially to our lady readers, and in order that the picture may be placed within the reach of all, we have scaled the club so low that it partakes more of the nature of a gift than a premium.

5 SUBSCRIBERS AT $2 EACH,

will entitle any one to the Engraving.

For specimen copies and outfit for canvassing, address

RURAL NEW-YORKER,
78 Duane St., New York.

Implements and Machinery.

Switzerland to America Greeting.

The Centennial Judges having awarded to the Messrs. BOREL & COURVOISIER 2 Prizes at the late Centennial Exhibition for their production, one for extreme accuracy in adjustment and regularity in performance, and the other for display, they are now offering their Watches at a great reduction from former prices, having introduced improved machinery, whereby the production is increased, and the cost of manufacture greatly reduced, and the quality and durability greatly improved, insuring a first-class NICKEL MOVEMENT WATCH within the reach of all. These Watches, so favorably known for the past 18 years, are made of the best material, and have all the modern improvements in watch making having **Chronometer Balances, Breguet Hair Springs, Tempered, Hardened and Isochronised for R. R. Travel, Fine Ruby Jewelled,** and are warranted to perform with the regularity and accuracy of a Chronometer. These Watches are for sale by all our local agents throughout the country, and parties desiring a good and durable time-keeper, are requested to examine them before purchasing those of other manufacturers or home productions.

It is a mistake to suppose that any department of a paper may be slighted. The most important information is to be found, at times, under the guise of an advertisement; and it is agreeable to the advertiser and a courtesy to the publisher to mention the source of your information—in other words, to mention the paper.

Wit and Humor.

SPARKS AND SPLINTERS.

"COLONEL," said Spicer, as a long-winded individual with largo ears finally left the office of the Dealaspare Insurance Company, "that man is a donkey." "Oh, no," said the genial colonel, "not a donkey, only an ear relation."

(ONE of the Kentucky Minstrels is sitting for his *carte* in character.) Operator: "Now, sir. look pleasant—smile a little." (Minstrel smiles.) "Oh? that will never do. It's too wide for the instrument."

THE Orientals are very trusting to each other. "Are you not afraid to go away from your shop without locking it?" a traveler asked an Egyptian up the river. "Oh, no," answered the man ooolly, there is not a Christian within three miles!"

"I DON'T know what you mean by being an Irishman," said a gentleman who was about hiring a boy, "but you were born in Ireland." "Och, your honor, if that's all," said the boy, "small blame to that; suppose your cat was to have kittens in the oven, would they be loaves of bread?"

A PAPER has this advertisement: "Two sisters want washing." Millions of brothers are in the same predicament.

ONE by one the roses fade. It is now boldly denied that men who wear long hair are possessed of any more talent than those who have it clipped close.

MRS. NICKELL, of Kentucky, has just presented her husband with the twenty-first pledge of her fidelity. The region ought to be well supplied with small change.

"QUITE correct, my dear; the natives of South Africa do not require clothes to keep them warm, because they are Hottentots, don't you see? Coolies are a different sort of people altogether. So are the people of Chili."

THE name of a centenarian recently deceased was Lettus Steel. He was no politician either.

A NEGRO insisted that his race was mentioned in the Bible, for he heard the minister read about how Nigger Demus wanted to be born again.

A JUSTICE of the peace in Illinois is named Works. How pleasant to know Justice Works, and works by sight, too!

CONFUSION OF CAUSE AND EFFECT.

MAGGIE. "Oh! Tommy! ! look at that *sweet* little Thing! ! ! I'm afraid it's afraid of *Chimborazo!* Just wag *Chimborazo's* Tail, to put him in a good Temper, there's a good Boy!"

TO WHICH THE READER'S ESPECIAL ATTENTION IS CALLED.

We earnestly request that all letters containing money, or any communication intended for the Business Department of the paper, be ADDRESSED to the EDITOR, or to THE RURAL NEW-YORKER, and NOT to any INDIVIDUAL. We cannot otherwise guarantee the prompt entry of names upon our books, or the acknowledgment of money received.

The free seed distribution, announced in our issue of Nov. 10, was discontinued at the end of the year, having been extended beyond the original term announced. It was intended for the benefit of our old subscribers, and not to induce new ones.

As has already been stated, we are thus early making preparations for our next annual seed distribution, which we believe will please our horticultural friends as well as anything that has ever been offered gratuitously.

As it is the desire of the proprietors to subserve the interests of the readers of this journal in every way, we respectfully invite them to communicate with us freely upon all topics respecting which they desire information.

We would state that our lowest club price (five or over) is $2; single subscriptions, $2.50. Any agent offering the RURAL NEW-YORKER for less, has no authority for doing so, and his subscriptions will be promptly rejected.

RURAL NEW-YORKER, 78 Duane St., N. Y.

2000 Varieties Rare & Beautiful Flower Seeds.

AGRICULTURE AND EDUCATION IN THE UNITED STATES.

PROF. I. P. ROBERTS.

No. 2.

In my last I pointed out some of the influences and circumstances that energized the people of the Old World, and made them long for greater freedom and knowledge, especially the latter. The desire for freedom seems to have been of slower growth than that for education; and of necessity must be, for unless the latter precedes, the former cannot be lasting. The desire and longing for something better and higher were not lost by those brave and dauntless people who left the Old World to find a home in the New, but rather intensified.

It is not strange then that among the first acts of the Colonies we find provision for the instruction, not only of the children of the well-to-do, but of the poor and the servants. WILLIAM PENN'S first plan for his proprietary government, drafted before he left England, made provision for public schools, and the rewarding of authors of useful sciences and laudable inventions. Schools were established at New Amsterdam in 1633, and at the time of the surrender to the English, 1674, schools virtually free, existed in nearly every town and village in the Colony.

In 1635, the people of Boston established a school, and one year later the General Court authorized an appropriation of £400 for the establishment of a "Schoole or Colledge, whereof £200 to be paid the next yeare, and £200 when the worke is finished, and the next Court to appoint where and what building."

In 1683, an island in the Delaware, opposite Burlington, was set apart for educational purposes, the revenue derived from the rent or sale to be a perpetual fund; and this, it is believed, was the first school-fund established in America. In 1795, Governor GEORGE CLINTON, it is said, laid the foundation of our common school system of New York. The need of education appears to have been as clear to him, as that of connecting the great lakes with the seaboard. But space will not permit to mention a tithe of the laws enacted or donations bequeathed by Government and individuals for the benefit of education.

Government has granted some 140,000,000 acres for that purpose exclusive of the grant of 1862. No country on the face of the globe has equaled ours, in the amount of private and public gifts for the promotion of knowledge. When we look over these three million square miles of territory transformed from a wilderness into fruitful fields dotted with homes bursting with plenty; when we behold the innumerable thriving villages and cities on every hand, connected and bound together by strong bands of steel, common parentage and interests; when we see science striving with laudable efforts to enhance the fruits of toil and alleviate suffering; when we see forty millions of people actuated by one common purpose to make the next generation more wise, more happy, more virtuous than the present one, truly we may exclaim "What hath GOD wrought?"

With all the evidences of strength on every hand that go to make up an enduring and prosperous nation, we still have those among us who can see but the comparatively few scamps and improvident poor, and therefore predict that we are about to become a *nation* of thieves and tramps. Can it be possible that we who are the children of people noted throughout the world for courage, independence and an unquenchable thirst for knowledge; noted for their hatred of oppression and wrong, for their law-abiding and GOD-fearing principles, have so degenerated, have so disgraced our noble ancestors? No: it is not possible; it is not so. The little clouds that are so magnified will soon be dispelled, and we shall steadily advance to greater prosperity and usefulness; and education has been, and will still continue to be, the great balance wheel that will overcome all resistance and keep us steadily striving for the good and the true. The tillers of the soil are not a separate class, only as their occupation leads them to common interests. They are an integral part of the whole, with like aspirations and desires for more knowledge and grander opportunities.

As the years passed by and many of the industries and professions, through education, rose to a prominence and power far exceeding their former conditions, it was readily seen by a few active and thoughtful minds, that unless something was done for Agriculture it would fall into disrepute and decline, that the bread-raisers would be unable to cope with the better educated in other callings, and that the time was not far distant when the educated would own the land, and the uneducated farmers till it. Michigan occupying a part of, and lying adjacent to the vast fertile prairies, with its restless, energetic, and advancing population, caught the inspiration first, and in 1855 established a college near Lansing for instuction in Agriculture and kindred branches. This attracted but little attention for some time, but it did good work and therefore grew and prospered, and when its graduates went forth to active duty, their ability was recognized and what was looked upon at first as only a doubtful experiment was pronounced an assured success. So much faith had Senator Morrill in the new methods of education, during Buchanan's administration, that he introduced a bill granting large tracts of the public lands to the various States and Territories, the income from which should form a perpetual fund for the advancement of technical instruction.

This bill passed both Houses, but was vetoed by the President. It was again introduced in 1862 with some modifications, passed both Houses, and received the signature of President LINCOLN. The originator of the bill appears to have had a very clear understanding of the wants and needs of the rising generation, but its wise provisions appear to be but imperfectly understood. It provided for the issuing of land scrip to the amount of 30,000 acres for each Senator and Representative in Congress. It also provided that each State or Territory claiming the benefit of this act, should within five years from its passage, "Provide not less than one college which should receive for its endowment, support, and maintenance, the interest of all moneys derived from the sale of the aforesaid scrip or lands, and that:

"*The leading object of these colleges should be, without excluding other scientific and classical studies, and including military tactics, to teach such branches of learning as are related to Agriculture and the Mechanic Arts; in order to promote the liberal and practical education of the industrial classes, in the several pursuits and professions of life.*"

You notice that "other scientific and classical studies" were not to be excluded; as it turns out, this provision is a very wise one, for if the student is to receive no general culture, he is only half-educated, and the officers of schools organized and conducted under this law, find that it is necessary, in order to reach the best results, to teach several branches formerly considered of little value to students in Agriculture and the Mechanic Arts.

The provision for instruction in military tactics is one that should not be ignored or passed over lightly. Though frequently lost sight of, I believe it to be of great importance, both to the nation and the individual student. Nothing appears to give him that manly dignity and bearing, that respect for law and authority, so rapidly and effectually as Military Drill. And the instruction and discipline are of value to the recipient in times of peace, but how much more so in times of great commotion! In case of a great war, I can see the untold benefits that would accrue to the nation from having scattered over the States several hundred trained men who, from their education and previous military instruction, could, on short notice, be made into efficient officers. I would like to see this provision of the law carried into execution more generally than it has been, as I deem it one of the wisest, if not the wisest provision of the act.

At the close of 1875, 2,889 students were receiving instruction in Military Science in the colleges organized under this grant. Estimating that at the present not less than 3,000 young men are being taught and drilled by experienced and competent officers without any cost to the Government, we can readily see that it is getting more work done in this one direction for this grant, than it could have done, had it sold the lands and invested the money at six per cent. and expended the interest for instruction in Military Tactics. Not far from 10,000,000 acres were granted. This at Government price ($1.25) would give $12,500,000; this at six per cent. yields $750,000 in interest; dividing this by 3,000 (the number of students now taught) it would give $250 as the cost of instruction per year for each one; less than one-third of what it does actually cost the Government schools to give instruction in Military Tactics.

It may be said that the instruction is not so extended and complete in the colleges as in the national schools. This is true; but after making all possible allowances, we find the gift is a paying and a wise one.

I desire now to call attention to the last clause of the law, "In order to promote the *liberal* and *practical* education of the *industrial* classes in the *various pursuits* and *professions* in life."

Could anything be more comprehensive? more liberal? more just? None to be excluded on account of color, sex, age or previous condition, and, while it was desirable that the leading objects should be the promotion of Agriculture and Mechanics, yet all must be welcomed and free to choose that course of study from which they could derive most benefit.—[To be continued.

RURAL TOPICS.

T. B. MINER.

ROTATION OF CROPS.

A GOOD farmer is known by his judicious rotation of crops, because all crops do not draw from the soil the same relative amount of its fertilizing constituents. Probably there is no better rotation than to begin with corn on a grass sod; and the question may arise, "Is it best to plow the land early in the spring, and give the sod the more time to decay, or should it be plowed at the time of planting the corn?" I think that it is decidedly the best way to plow and plant immediately, so that the corn may be up before the grass has grown much. I have seen fields that were plowed for corn two or three weeks before it was planted, so full of grass that the corn had a hard struggle for life till the grass was subdued.

The next crop after corn may be potatoes, barley, or oats; and in the fall put in winter wheat and seed down to timothy, and sow the clover-seed in the spring, in March, while the surface of the soil freezes at night and thaws by day, which opens the soil and lets the clover seed into the numerous little cracks. Another way is to sow the clover seed in April, and run a fine-toothed harrow over the land both ways. If the soil is light, the harrowing will benefit the wheat, eradicate the weeds and cover the clover seed.

But this rotation requires an application of manure to each crop in order to produce good paying crops, as a general rule. There is no use in farmers in the old States trying to keep their farms in a fertile condition without manure; and they should keep enough live stock to supply what dung *must* be applied to their lands, and this can be done the most profitably by keeping *first-class* milch cows. No farmer who owns ten or twelve cows that yield a pound of butter a day on an average of nine months in the year, need fear to see the village constable call on him, as he will have no summons to serve on *him;* but he will have one for his neighbor who keeps but two or three cows, and of a kind that are sold "cheap"—the poor "critters" that one finds at auction sales, and which would be dear at $10 a head.

WHAT ALL CROPS REQUIRE.

Every kind of crop or plant can be grown in perfection, if we apply to the land potash, phosphoric acid and nitrogen, the land and air always supplying what else is needed. Stable dung contains no other fertilizing constituent of much importance. Every fertile soil contains enough of the above-named constituents to bear one good crop, or more in most cases; but every crop taken off the land lessens the supply, till at last we come to *worn-out* soils; what has taken place at the South with millions of acres, which were cropped with cotton or tobacco for many years without applying any manure. A good farmer has learned that land must be fed, somewhat on the same principle that he feeds his cows, but only once a year; and in some cases, once in several years is enough, or just before seeding down to grass. I hear some one ask: "How shall we feed our land—with stable dung? or with commercial fertilizers?" I reply with stable dung; and if you can obtain, or make enough of it, leave the commercial fertilizers as a last resort. A writer says: "Each crop must have its own peculiar food, and in proper proportion, too." When a man talks that way, he is getting into the subject beyond his ability to advise farmers profitably; because, as I understand him, he is coming to the theory that all a farmer has to do to raise good crops, is to say to his land "Doctor" (vender of fertilizers,) "I want fertilizers for such and such crops;" and the "doctor" prescribes for each, according to the tables showing how much potash, phosphoric acid and nitrogen each crop draws from the soil. This theory is being revived in this country, after a long repose; but it is not reliable. In some cases it may work well; but generally the crops grown on this principle have not been satisfactory to anybody but the land doctors, because it is not possible for anybody to know the relative proportions of potash, phosphoric acid and nitrogen, that is in the soil *before the fertilizer is applied.* Analysis cannot give solutions of such questions, that are reliable, as every field, and perhaps every square rod in a field have different degrees of fertility.

BLOWING UP STUMPS.

It has been demonstrated that stumps can be blown out of the ground much cheaper than pulled out. In an experiment lately tried, five stumps were operated on, the first being oak. A hole was punched under it between two projecting roots. Then a cartridge of dynamite about two inches long, and an inch in diameter, was inserted in the hole, which was made with a crowbar; and on being fired, the stump was blown out. Next, a chestnut stump was served in the same way; and it was blown, as the report says, "to atoms." Other stumps which would have cost a dollar each to remove in any other way, were thrown out skyward. A charge was put under a rock of about two tons weight, and it was thrown from its bed and shattered to pieces. With larger charges, stumps were blown 125 feet. Dynamite was also shown to be a powerful agent in breaking up rocks, by drilling holes in them from six to twelve inches deep; and charging them with dynamite, which is put up in packages of oiled muslin, in shape like a candle, and impervious to water. One end is opened when used, and a hole is made in the powder with a stick to insert a percussion cap an inch long, and loaded half its length with fulminating mercury. Then a fuse is inserted in the cap, which, with other appliances, renders the successful use of this powerful explosive powder a thing to be carefully learned, or something might be "blown up" besides stumps and rocks.

PAINTING FARM IMPLEMENTS.

I suppose that there are many farmers who never used a paint brush; and I can imagine how their old rusty wagons, plows, etc. look, the wood-work badly cracked, and going to ruin rapidly. It is of as much importance to keep farm implements well painted, as it is to paint a house; and every farmer should have an "outfit" of painting materials on hand, so as to be prepared to do any job in that line that may be necessary. All that is necessary, is a two-gallon oil-can, a couple of brushes of different sizes, and the necessary paint; but that can be bought as wanted, yet it is better to buy a 25 pound keg of white lead, and a can of oil (half boiled and half raw) as they will keep a long time. For plows, harrows, and the running-gear of wagons, you need only red lead and oil; but for other colors you will require the white lead. If you want a common black paint, use lamp-black and oil; but for a carriage body get black coach paint at the wheel-wright's, also some varnish to finish with. You would be surprised to see the nice work that you or the "boys" can do after a little practice; and when you get in the way of doing your own painting, your keg of lead won't remain on your hands long. Why, there is *money in paint*—actually bank bills, and gold, and silver dollars! For instance, you buy a new farm wagon, and and keep it well painted, and under cover when not in use. Now, your neighbor buys one at the same time, and doesn't paint at all for ten or fifteen years; and what is the result? Worn out, decayed wood-work, split and cracked, must be thrown aside as "used up," while *yours is as good almost as when new.* You have found a hundred dollars in your paint; but your neighbor, poor man! has got, perhaps, to stint his family in the necessaries of life to pay for a new wagon.

Linden, N. J.

WESTERN ECHOES.

FROM THE "MAPLE SHADOWS."

DR. A. C. WILLIAMS.

A VERY common mistake, West, is that of running land too long to one sort of crop. A field is selected, supposed to be the choicest soil for wheat, and it is set apart for that cereal, and expected to furnish the family with bread, year after year, with little or no manuring, and when the yield necessarily falls off annually, the actual cause is overlooked, and the season regarded as unfavorable, not sufficient seed planted, or the variety of wheat "run out," Other portions of the farm are run in corn in the same manner and, sooner or later, foxtail, cockle-burrs, "Spanish needles" and "lambsquarter" are a little "corny" in spite of all that can be done. The judicious rotation of crops is one but little understood, and seldom practiced. The disposition of the straw after the grain is threshed, is the most striking instance of extravagance and waste to be seen. It is a rare case to find a farmer who carefully stacks and feeds his straw, or makes any effort whatever to have it returned to the soil whence it came. If sufficient help is secured to get it away from the machine, no further thought is given it, more than to see that a match is applied before it would fail to burn. A boy, a horse, a fence rail, with one hand to help him load, is considered sufficient, and the straw is hauled and scattered over an acre or two of the field, and it makes a fire that delights the farm boys very much. I know of one or two farmers, however, who save their straw.

The best farmers we have in our neighborhood are Germans. They have taken land that everybody else regarded, before their advent, as entirely worthless, and now have the finest farming lands in the country, every acre of which is in the highest state of cultivation. They grow wheat largely, understand the benefit of draining their lands thoroughly, and know how to make money. The rapidity with which large stumps have vanished from their fields, has been a matter of wonder to those who are more careful about laying out their strength.

I begin to entertain great fears that the generality of our farmers will never receive much

benefit from the grape. They seem to be utterly unable to manage their vines skillfully, or at least sufficiently to secure paying crops. I am surprised to see the condition of vines, when called upon occasionally to inspect some old, sturdy farmer's vines, which have failed, with his treatment, to yield him fruit. I find, generally, one or two difficulties are all that are in the way to a moderate crop, yet they make a good many mistakes if a large yield were desired. The first mistake, and it is universal, is trying to secure fruit before the vine has been allowed to make a sufficient amount of root growth. Farmers are very much discouraged if they get no fruit the first year, and if little or none the second, they get out of all patience. Another trouble is that of pruning, or rather not pruning, as they seem to think that the more cane, the more fruit, and therefore fail to prune their vines at all.

Late this fall I dug and worked in around my grape vines from two to four bushels of well rotted manure, ashes, anvil cinders, and am giving them all the soap-suds on washing days. I expect a wonderful yield next season.

Hugo, Ill., Jan. 5.

Farm Economy.

THOUGHTS FROM A FARM.

LET THE FARM REMAIN UNKNOWN FOR THE PRESENT AND THE WRITER REMAIN INCOGNITO.

WOMEN FARMERS, ETC.

THE winter season with its long evenings, gives ample time for reflection on the past and thought for the future; consequently, the past, the present, and the future are before the mind, the latter partaking of foreboding in some respects. Thoughts are hidden by all designing minds, and almost all niggardly dispositions endeavor to hide their intentions because, if known, the knowledge might interfere with the carrying of them out; and moreover, all stingy, dishonest, and overreaching men, are somewhat ashamed, and defer the exposure of their meannesses till the last moment possible. It is, therefore, thought by the world "smart" to be reticent; many however, are naturally so, having always from childhood been reserved, allowing others to do the talking; and this is very fortunate, for a taciturn person escapes many little difficulties and some serious ones sometimes, by habitual silence. Yet, when a man who is not silent by nature endeavors to mislead people and uses speech for the purpose of hiding his thoughts, it is pretty nearly certain he is far from being an honest, straightforward man.

It is supposed a great deal of good is done to agriculture by the correspondence carried on in a newspaper like the RURAL; but much more benefit would accrue to farmers if they would be particular to curb all prejudice and be sure they are right before condemning any course of husbandry, before they decry any breed of animals, and also before recommending any new kind of cultivation of soil, or any steaming of food and expensive cutting of chaff, &c.

As the best farmers in England, and those likewise who make money and win the prizes of the Agricultural Society as the occupiers of farms which are in the best possible form and condition, are all high feeders of stock and thus feed the land till they succeed beyond all other farmers, it is thought to be a fact beyond contradiction that high feeding of animals of every description must be the only road to prosperity as an agriculturist where the situation prevents the purchase of manures. It is likewise believed that as women are winning more premiums in proportion than men, that the old feeble-minded trash about so much bodily labor being indispensable, is really nonsense of the worst kind, as it leads to so many farmers placing dependence on working alone, so that it is seen that men of this class moil and toil till they are thin as a bean pole, and their wives are, poor things, worn out, and die of broken constitutions, through the worry of a farmer's home.

Here is proof that

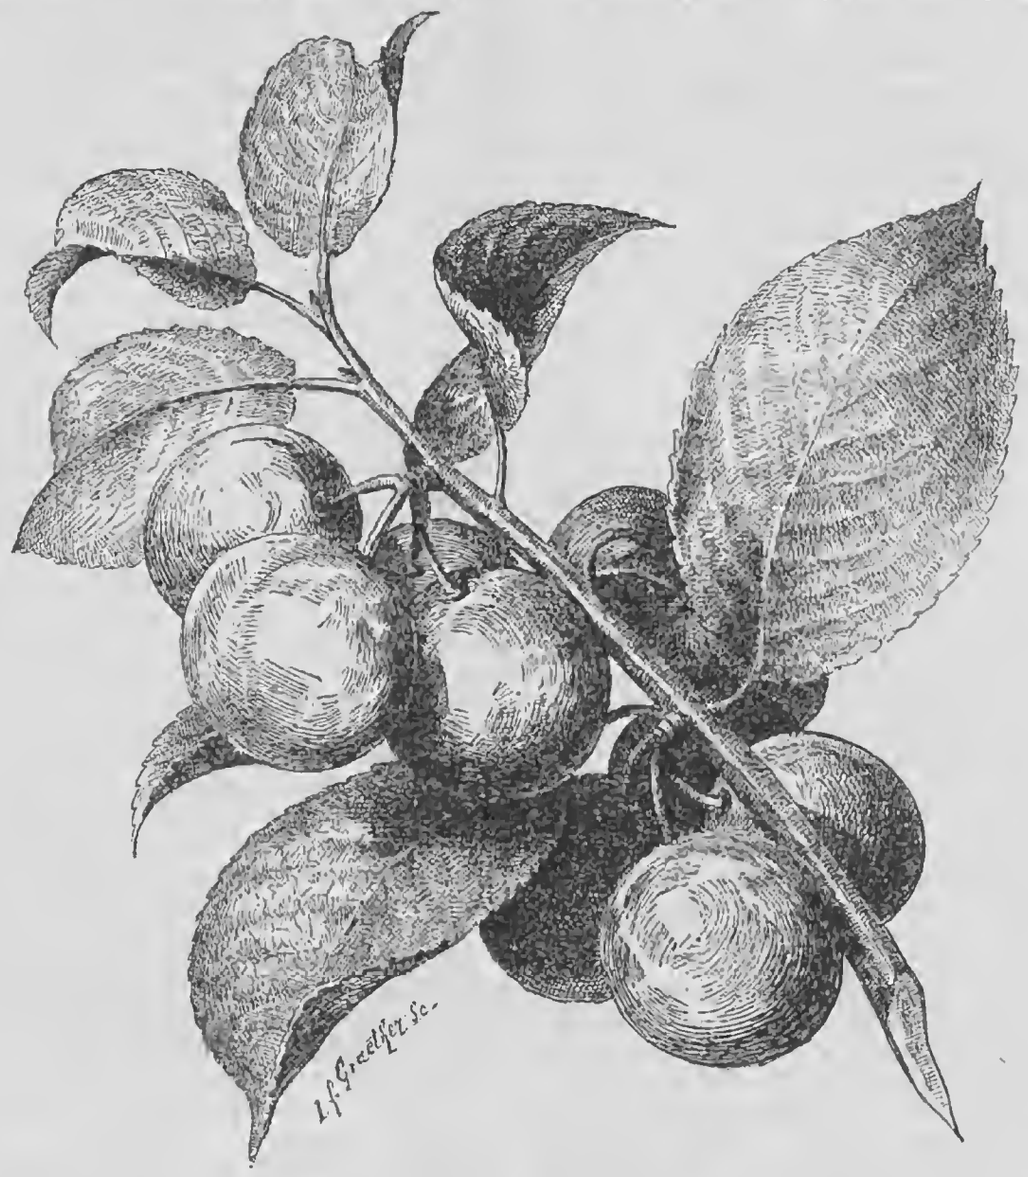
> "He who by the plow would thrive,"
> Need neither hold the plow nor drive;

for these lady farmers certainly never touched the plow, and nobody can be foolish enough to argue that they ever said "come along, boys," or that they did carpenter's work, or painted their implements, or did all errands at night, after the sun was down.

But these farmers in petticoats more than made up for the loss of their husbands by looking forward and well considering the results following abundant use of oil-cake and other forcing food, and these liberal-minded widows, although only renting the 300 or 400 acres by the year, feed thus freely for the sake of the rich manure thereby made and continue to do it annually; but here, in the United States, the farmers would term such a generous diet for the young stock and the sheep and cows, profusion and extravagance. Sheep, especially in England, are highly fed and forced to be ripe mutton at an early age and there is no doubt of sheep paying as well in the United States only the poor trembling gentlemen farmers as well as all the rest are afraid of good feeding, and cannot be made to understand that it will not do to shut breeding ewes and ewes with lambs in barns, stables or sheds and keep them there for months.

A woman when she farms is not craven-hearted. She hears or reads of good farmers who purchase oil-cake and feed it to their stock, and she buys great quantities and thereby fattens her beef and mutton to a first-class quality and she hastens the maturity of all the young stock saving a year's slow feeding, and also she gains in wool. But her gains do not stop here, for she has made her calculations and she doubles her crops of grass, grain and roots by the exceedingly rich manure she obtains by this high feeding; so that she is a gainer every way, and the much coveted prize is gained over the heads of the other sex at the Royal Agricultural Society.

Thinking over these facts and knowing that many herdsmen and shepherds are valued most highly because of their being able to manage all fattening animals so as to keep their appetites sharp, that in short, those are the best "carters" "cowmen" or shepherds who can contrive to make the animals eat most, it is odd that here, in the United States, instead of trying to make the animals eat as much good feed as possible without being cloyed, one man steams the buts of corn stalks to save feeding more costly food, a second has the cobs of corn ground with the corn, a third cuts rough, weedy herbage into chaff, a fourth will cook all the food, and a fifth deprives full grown cows of every kind of food excepting three quarts of meal for feed, or some such ridiculous quantity. And men believe cows will live all winter on such short allowances! But it cannot be and what the object of those who make these assertions can be it is very difficult to imagine. There are many extraordinary statements made relative to agricultural subjects, most of which are errors; yet, probably in some instances, although notoriously erroneous they are implicitly believed in by a few families. Even now, in 1878, there are old women, not in petticoats, who still think there is a baleful influence on meat, or vegetables and on the blood &c. at certain stages of the moon, and that cows with horns have diseases which polled cattle cannot have &c.



BASSETT'S AMERICAN PLUM.

Pomological.

BASSETTS' AMERICAN PLUM.

THE only successful method of fighting the curculio is that of jarring the trees and collecting the insects upon sheets spread under them. This must be commenced at the time the fruit is the size of a pea, and continued, daily, until it begins to ripen. As effectual as this method may be, and as desirable as it is to raise this beautiful and delicious fruit upon one's own premises, few there are who are willing to give the necessary time and trouble to applying the remedy with the regularity and thoroughness needed to render it effectual. Either in localities where this mischief abounds we must abandon the cultivation of the finer varieties of the plum, or we must content ourselves with varieties so thick-skinned that they are proof against its attacks. Bassett's American Plum, of which we furnish an engraving from life, is said to be curculio-proof, and although of inferior quality, it is yet possessed of merits that highly commend it to general cultivation. For culinary purposes it is perhaps as good as any, while its productiveness seems to be measured only by the size and strength of the branches.

Messrs. HANCE & SON of Red Bank, N. J., presented us with two of these trees last spring. Their growth has been something remarkable during the past season, and the leaves were retained fresh and green long after those of other varieties had fallen.

The Garden.

TOMATOES.

GEO. E. DRAKE.

THE interesting communication to the RURAL of the 29th ult. by your esteemed correspondent, Prof. BEAL, was brimful of meat without any shells, and an excellent example for contributors to follow.

My experiments have run through a dozen seasons and included about twice that number of varieties. The results differ somewhat from the Professsor's, probably owing to a different character of soil and climate. I commenced with the Yellow Plum and the Smooth and Large Reds. The former was early and excellent for eating uncooked and for making into figs. The Gen. Grant was popular when first introduced, it being quite smooth, prolific and medium, or second early, but not an equal of many newer kinds, and the Canada Victor may be mentioned as its superior and in every way desirable, but not excelling all others either in earliness, smoothness or prolificness. The Trophy is truly "a memorial of victory" as a late variety and for general cultivation, but is a long way from perfection in ripening. Yet every year it improves in this respect when due care is exercised in selecting specimens for seed. Hathaway's (Excelsior) is a desirable variety, but needs judicious management, and I imagine that the reason of its not coming up to Prof. BEAL'S expectations was the lightness of his soil. A heavy and highly manured soil must also be avoided, in which case it produces too many leaves and stalks at a sacrifice of fruit. But when the soil is a happy medium and the season favorable, this is second to no late variety for quality and quantity. It is smooth, solid, deepred but not so large as specimens of fruit from Trophy plants. The Conqueror is very early, but not smooth, or solid, being in those respects inferior to its parent, Gen. Grant. It produces fruit of different sizes and shapes, and a careful selection of seed specimens can make either a small smooth, or a larger creased variety of this. Had I not received my seed direct from the originator, I should have thought it was mixed, there being so much difference in the fruit. The Little Gem is the earliest variety now before the horticultural community, but E. S. BROWNELL, who shares with the originator of the Little Gem, the modern honors of potato hybridization, claims to have an unintroduced variety earlier than it. Although it is small, I prefer the Gem to its parent the Conqueror, and the reader of Prof. BEAL'S article will see it is much earlier, as he sowed the seeds when the Conqueror was transplanted. The Golden Trophy is large, late and prolific, and when grown in land under a high state of cultivation, there will be an enormous growth of stalks and fruit. But the latter will be very uneven in surface and like three other yellow varieties I have tested, I do not consider it a desirable acquisition to the list of tomatoes, although they may add to the beauty of the table when served with the red varieties.

For successive use in a family, I would select Little Gem, Canada Victor and Trophy, adding Hathaway's Excelsior for the fourth kind and substituting it in place of the Trophy, whenever the soil is adapted to its cultivation.

CHUFAS.

Having cultivated chufas or ground nuts two years, and there being slight indications of a "fever" on them, I would advise farmers not to let their ideas run too high on this subject, for they are nothing new, and, although very prolific and edible, are not delectable. The great labor incident to harvesting will prevent their being extensively produced for swine or poultry, and when estimated in bushels Artichokes will exceed them in yield. Frost kills their germinating powers.

Merrimack Co., N. H.

PEERLESS MELON.

IN the RURAL of June 9, 1877, page 359, your able correspondent, W. H. WHITE, contributed a very practical article on "The Melon—Its Culture and Varieties."

In the list of Watermelons he mentions only Black Spanish, Mountain Sweet, Ice Cream and Citron Watermelon, all of which I have cultivated, and Phinney's Early Black Italian, Goodwin's Imperial, and other kinds to the number of nearly a dozen. The most of those varieties were tested several years ago, and the Mountain Sweet selected as the best and the one with which to compare novelties as they were introduced.

In 1875 I procured a package of Peerless Melon seed, and all who ate of the fruit pronounced it vastly superior to the Mountain Sweet, and ever since then the Peerless has been without a peer in my estimation. The introducers of the melon give the following description of it:—"This is unquestionably the best Watermelon in cultivation. Of medium size, thin rind, light, mottled green; flesh, bright scarlet, solid to the center, crisp, melting, and sweet as honey. Our stock of this variety all came from one melon selected several years ago."

With me the melons grow to equal the size of any other variety I ever tested, and have proved to be quite early. The seeds are white and, as a rule, are rather inferior. G. E. D.

Merrimac Co., N. H.

Floricultural.

BULBS FOR THE FLOWER GARDEN.

W. C. L. DREW.

NARCISSUS.

THE oldest bulbous plants in cultivation are without doubt the Narcissus. For many hundred years they have decorated the flower gardens of the world. To tell the present advanced floricultural world, that, 200 years ago, there were more varieties of these favorites in cultivation than we now have, would astonish many, yet the records which time has left behind prove that, with the exception of the Tazetta group, such was the case.

In examining into the records of the Narcissus, I find that according to the best botanical authorities there are over one hundred varieties now in cultivation. Many of these must, to an inexperienced amateur, appear to be one and the same. In systematizing the Narcissus, botanists have divided them into three groups, Narcissus proper, including the single and double or *flore pleno*, also the old-time Daffodil; Narcissus Tazetta, including the double and single Polyanthus Narcissus, the third group being the old-fashioned and still popular Jonquils, both double and single, great and small.

These groups are distinguished by their habits of growth, and shape of flowers. In color their

is very little variety throughout the family, pure white and shades of yellow being the only colors found.

In making a selection of Narcissus for the garden, a dozen good varieties will be sufficient for quite all of our American amateurs; yet they will find described in all the floral catalogues, from thirty varieties upwards, which they may be induced to think necessary to a grand display. This mistake must not be committed, for if the uninitiated were to get such a collection, they would find three or four without apparent difference, and disappointment would follow.

But whatever kinds are selected they will certainly be of easy culture and perfectly hardy; and what is far more to the point—very, very handsome.

The Polyanthus Narcissus are the palm-bearers of the family and those to which we would invite special attention. They are better adapted for culture in pots and dishes of water than the others, a point that should not be forgotten. Unlike other Narcissus which only bear one to two flowers on a single stem, these produce from ten to twenty on a stem from each bulb. When desired for house culture in water or pots treat as you would Hyacinths, and they will repay you ten-fold for your trouble.

Of the Polyanthus Narcissus possessing special merits, we would mention the Golden Eagle, a handsome yellow flower, for a brilliant golden yellow. Grand Soleil d' Or, a pure white color, Bouquet sans-pareil and White Pearl.

Of the single Narcissus of special merit the Poeticus takes the lead, than which nothing can be purer or more beautiful. Close to it we find Incomparable and Moschatus. Of the double varieties Poeticus flore pleno, Phoenix and Pumilus are extremely fine.

In cultivating, plant in light, rich loam; set bulbs three inches deep; when once planted do not disturb for three or four years, as they will then flower much stronger.

El Dorado, Cal.

ANNUALS.

BY WILLIAM FALCONER.

No country in the world is richer in beautiful annuals than is the United States, west of the Mississippi, notably California and Texas. In the Eastern States our supply is somewhat limited, but once in possession of seeds of the Western species, it is our own fault if we ever afterwards be without them. They are admirably adapted for cultivation in our gardens, as they grow readily, bloom freely and persistently—at least most of those I mention do and ripen seeds in quantity—some species like Leptosiphon androsaceus—a pretty little Californian annual, last in beauty but a short time, while Drummond Phlox, Eschscholtzia Californica, Gaura Lindheimeri, Chrysopsis pilosa, and Gaillardia Amblyodon, bloom uninterruptedly throughout the summer and autumn. Collinsias and Nemophilas are prettiest in spring and early summer, and Eryngium Leavenworthii, Aster tanacetifolius, and Amblyodon setigera, are in greatest perfection during fall.

Many sorts as Cercopsis, Eschscholtzia and Euphorbia hexagona and marginata, are so hardy as to "self-sow" themselves freely; but it is a neater and better method to gather the seeds and sow them when and where required.

Nemophila insignis and maculata, Collinsia bicolor, Whitlavia grandiflora, Clarkias, Lupinus nanus and densiflorus, and such like California annuals grow stronger and stubbier, live longer, and bloom more substantially and lavishly, if they be sown in the fall, September or early October, rather than in the spring. So far north as New England it is better to sow in a cold frame than in the open garden, and get the seedlings nice and stubby before severe weather sets in. In winter cover up a little and transfer to the open ground next spring. Over-crowding is extremely hurtful to annuals, it chokes them, spindles them, kills the half of them, and curtails the continuity of those that are left. Therefore, thin rigidly and timely, that is, when the seedlings are very young. For fall-sowing light unmanured ground gives the seedlings the hardiest constitution, but for spring-sowings rich soil is preferable.

Besides true annuals I have included a few plants, as Eschscholtzia and Gaura Lindheimeri that are perennials but best treated as annuals or biennials, in our northern gardens. Besides those already mentioned, the following are worthy of notice:

Callirhoe pedata; Cassia Chamæcrista, Partridge Pea; Centaurea Americana, Texas Star Thistle; C. A. var. Hallii; Eucharidium concinnum; Gilia coronopifolia, Cypress Gilia; Godetia grandiflora; Limnanthes Douglassi; Vesicaria gracilis.

SEED EXCHANGE.

My sister and I have a few flower seeds that we should like to exchange with some of the RURAL ladies. I will give a list of the different varieties we have:

Phlox (mixed), Portulaca (single), Marvel of Peru (red and yellow), Balloon Vine, Cacalia, Calliopsis, Antirrhinum, Acroclinium. Would like in exchange:—Verbena, Petunia, Gourds, Dianthus, Catchfly, Chinese Primrose, Bouquet Aster, Ten-Week Stock.

Please accept our thanks for the seeds you sent. We were much pleased with them.

Box 2, Union Springs, Cayuga Co., N. Y.

CATALOGUES, &c., RECEIVED.

E. MOODY & SONS, Lockport, N. Y. Semi-Annual Wholesale Trade List of the Niagara Nurseries, for Spring of '78.

They call special attention to the fact that their stock of standard pear and apple trees is unusually heavy.

The Vineyard.

THE GRAPE PROBLEMS IN OHIO.

M. B. BATEHAM:

As it was generally known that the subject of grape diseases and phylloxera would be pretty fully discussed at the meeting of our State Horticultural Society the past month, a number of vineyardists in various States have written me, desiring to be informed as to any new facts of interest on these topics, which may have been elicited at the meeting. Among these letters is one from the Consul-general of Germany residing at New York, referring to the grave importance of the phylloxera question to his nation, and the desire of the vineyardists to learn more about the ability of American vines to withstand the ravages of the root-lice.

An interesting letter was also read at our meeting, from Dr. G. L. AUSTIN, now a resident of Cambridge, Mass., who has spent nearly five years among the vineyards of Germany and France, and two in California where his father-in-law has been for many years, the owner of a large and prosperous vineyard. This letter was not written for publication, but I trust I shall be pardoned for giving the following portion, on "Phylloxera in Europe:"

"A year ago, this fall, I was among the vineyards of the Onarontes, in France, and in company with M. BOITEAU, made a pretty thorough examination of the devastation there going on. Since then, M. BOITEAU has written a masterly *brochure* on the subject, in which he takes the theory that I am prone to accept, that in France at least, over-cropping and neglect of the soil have contributed in no small degree to the present state of things. In the district where we were, 310 millions of gallons of wine were produced in 1875, and yet the great majority (seven-eighths) of these vineyards have never had a cent's worth of manure for upwards of a decade of years. The ground was full of old and decayed roots, and where the oidium had been the most prevalent, there was found to be the greatest degree of injury by the phylloxera.

"The baneful results of the insidious workings of the insect, were most noticeable in the month of September, for then the struggle which through the summer had been waged between the vine and the phylloxera, seems to end in a complete victory for the latter; and on a sudden the vegetation stops, the leaves curl up, and the vine is as dead as if the stem had been cut off from the roots.

"I learn by a letter recently received from M. P. A. MAONEN of La Grande Marque of Cognac, that at the present time, public opinion among the French vignerons is divided—some advising the importation of American native vines as stocks on which to engraft European varieties, while others oppose such practice, and claim that the phylloxera was brought to France on vines imported from America. The subject is a very interesting one, and I propose to publish an article on it, with illustrations, prepared for me in France, in an early number of the Popular Science Monthly."

There were quite a number of Ohio vineyardists present at our meeting, and in accordance with the request of the Secretary, they had made particular examination of the roots of the vines, especially where rotting or mildew had occurred the past summer, to see how generally, if at all, the phylloxera were present, and whether there was any evidence that the insects were the cause of disease, as had been suggested by Professor COOK.

The reports given showed that in many parts of Ohio, as elsewhere, much injury had been done by the rot and some by mildew, as usual; and it was also shown that the phylloxera was more generally present in our vineyards than had been supposed, but rarely so abundant as to seemingly affect the growth and vigor of the vines; nor could large numbers be found on any of the roots, though some of them had considerable of the warty appearance which is evidence of the presence of the lice. In fact, it appeared that, as a rule, the most rotting occurred where the vines were of rankest growth, and no phylloxera were discoverable on one-half of the vines which suffered badly from rot, while some which had phylloxera did not have any rot.

Prof. COOK was present, and gave an interesting lecture on phylloxera, with illustrations. He also stated that he found in the vineyard at Grosse Isle, an almost total failure of the crop from the rot, and the phylloxera on the roots of the vines so in proportion to the rotting of the fruit, as to convince him that the insects were the chief cause of the disease; though it might be that wet weather and the lack of perfect drainage, had something to do with it.

Reference was made to the records of the seasons, as made by Mr. HUNTINGTON of Kelley's Island, years ago, and his conclusions therefrom, as stated in the RURAL NEW-YORKER of Nov. 24, that the rot invariably followed much rainfall in June, while a dry June caused exemption from the disease. Some remarks were made confirmatory of this theory, and a decided majority of the grape growers present seemed agreed in the opinion that wet weather was the chief cause of rot, and that phylloxera had little to do with it.

Mr. G. W. CAMPBELL read an interesting essay on new varieties of grapes, and their ability to withstand diseases and insects. In speaking of phylloxera, he said he thought this insect was doing more harm in many cases than people supposed, and that by weakening the health of the vines, mildew and rot might be induced. He imagined that the rot, as well as mildew, was caused by a parasitic fungus, the spores of which were floating in the air and vegetate when resting on the foliage or fruit, whenever the atmosphere was in the right state as to warmth and moisture. He was convinced that *sulphur* was an effective remedy or preventive of mildew when applied sufficiently early and often; and he had been told that some vineyardists had found it beneficial in lessening the amount of rot. But on the whole, he said, he was in a better condition to receive information than to impart it, on these perplexing topics.

Much of the failure of the grape crop in Central and Southern Ohio, the past season, was owing to the injury done to the vines by the cold weather in March, following a mild February. As similar damage is often done by the winters in this and more northern climates, the advice was given to prune the vines in autumn and then bend them down to the ground, covering with a little earth to hold them in place for the winter. It was also recommended that young vines be planted where old ones show disease, and that the driest locations be selected, or very thorough drainage given.

Painesville, O.

THE EARLY CHAMPION GRAPE.

WHAT, AND WHERE IS IT?

G. W. CAMPBELL.

I HAVE reason to believe there are three or more grapes which have been introduced to the public under the above name, and the object of the present inquiry is to find out, if possible, which of them is entitled to it; and which, if any of them, are worthy of general cultivation.

The first grape bearing the name of Champion, that I remember to have seen, was at one of the meetings of the American Pomological Society, several years ago, at Rochester. This was, however, a red grape, but so coarse and foxy in character that I regarded it as of no value, and I think it has never found a place in the catalogue of any prominent vine-grower. Another, a black grape, said to have originated in Western New York, called Talman, or Tolman's Seedling, closely resembling Hartford Prolific, but ripening a week earlier, is also catalogued as Early Champion; but which name it *properly* bears I cannot find out. Now comes another Champion, or Early Champion, claimed to be distinct from the above, sent out by R. J. DONNELLY of Rochester, N. Y., and said to ripen *two weeks earlier* than the Tolman Champion. One would think this was enough in the *Early Champion* line; but I find there is still another from New Orleans, La., reports about which seem very much "mixed." President WILDER, at the session of the American Pomological Society held in Boston, in 1873, inquired about the "Early Champion," which he found earlier than any other grape, and with little pulp; but did not know whence it came. Dr. SWASEY replied that a grape called Early Champion originating in New Orleans, was fifteen days earlier than the Hartford, and one of the best grapes in cultivation. Mr. SAMUEL MILLER says he procured this New Orleans Champion, and has fruited it; and others in Missouri have done the same, but all find it so nearly like *Ives' Seedling* as to be undistinguishable from that variety. On the contrary Mr GARBER of Pa., says this New Orleans Champion is in every respect an *Isabella* only some two weeks earlier, and a very good grape.

Now, I hope some of your correspondents may be able to clear up this matter. And the grape which first received the name of Early Champion should be entitled to retain it; while the others if worthy of name or perpetuation, should be renamed, and all left to stand upon their own merits.

Delaware, Ohio.

Industrial Implements.

THE NEW "TUTTLE" KNITTER.

THIS machine as shown in the illustrations here given explains its peculiarity and its points of difference from the ordinary circular knitters.

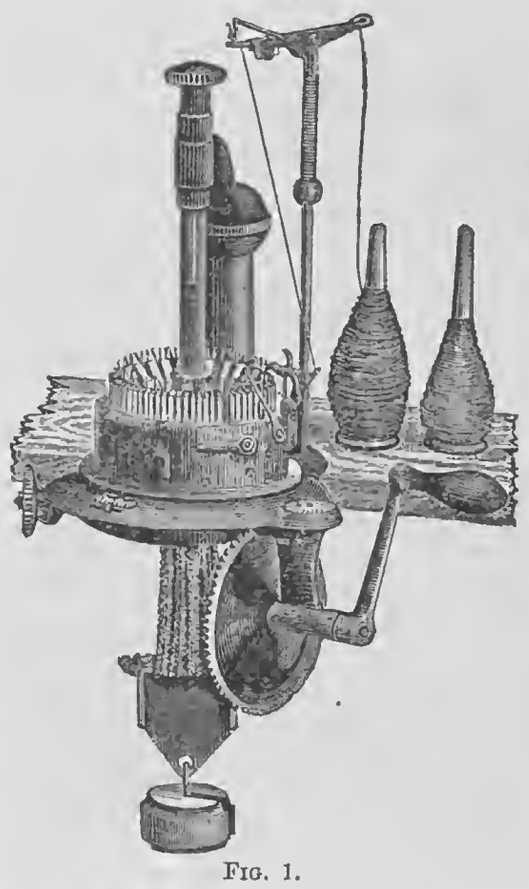

FIG. 1.

The machine has one perpendicular needle cylinder, used as a base, into which is introduced a conical needle cylinder held in position, so that by the rotation of the perpendicular cylinder, the needles in the cone cylinder are made to cross these in the straight cylinder while both are knitting, thereby producing a hand-rib stitch. This cone cylinder, when introduced into the perpendicular cylinder, is supplied with needles (being self-operating) taken from the perpendicular cylinder without removing the stitch from the same, thus turning the outside stitch which was knit on the perpendicular cylinder on to the inside of the work, precisely as in hand knitting. The inside or conical cylinder is so arranged that no more rib stitches are made than are desired; for instance, if it is required to knit just a few rib or seam stitches on the instep of the stocking, this can be done and the machine immediately changed back to plain work at the will of the operator.

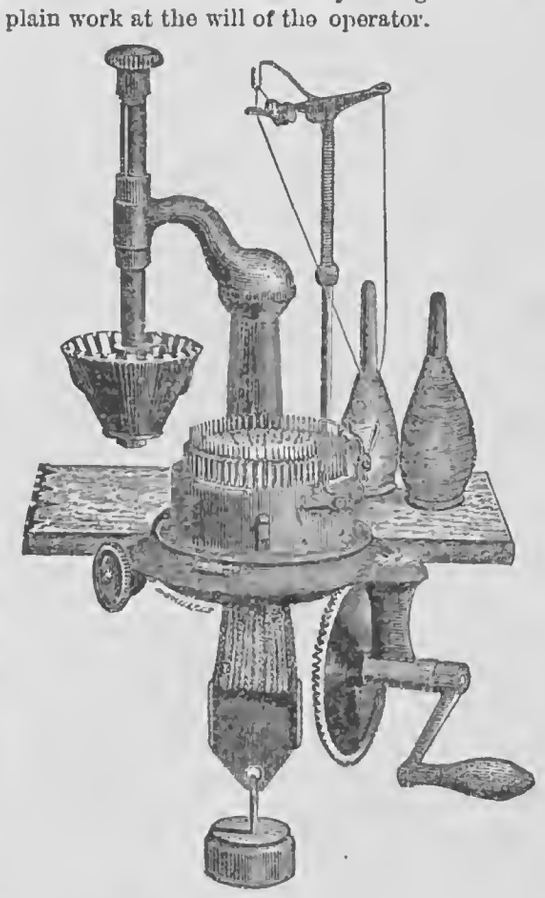

FIG. 2.

The usual mode of knitting rib top hosiery on this machine is to remove every other needle (or as many as desired) from the outside or perpendicular cylinder and place them in the conical cylinder and knit as far as may be required for the top of the stocking, and then change or return the needles from the conical to the perpendicular cylinder swing the cone out of work and go on with the plain stitch for the leg. When

the ankle or instep is reached the conical cylinder may be returned to work and the ribbing performed, either upon one side or all the way round at pleasure. It will be readily seen that the ribbing may be continued all the way down the leg or foot. Very unique and fanciful styles can be produced in this method of ribbing by alternating the plain and rib stitches. Mittens can be made with rib on the back of the hand and plain in the palm of the hand, and *vice versa*.

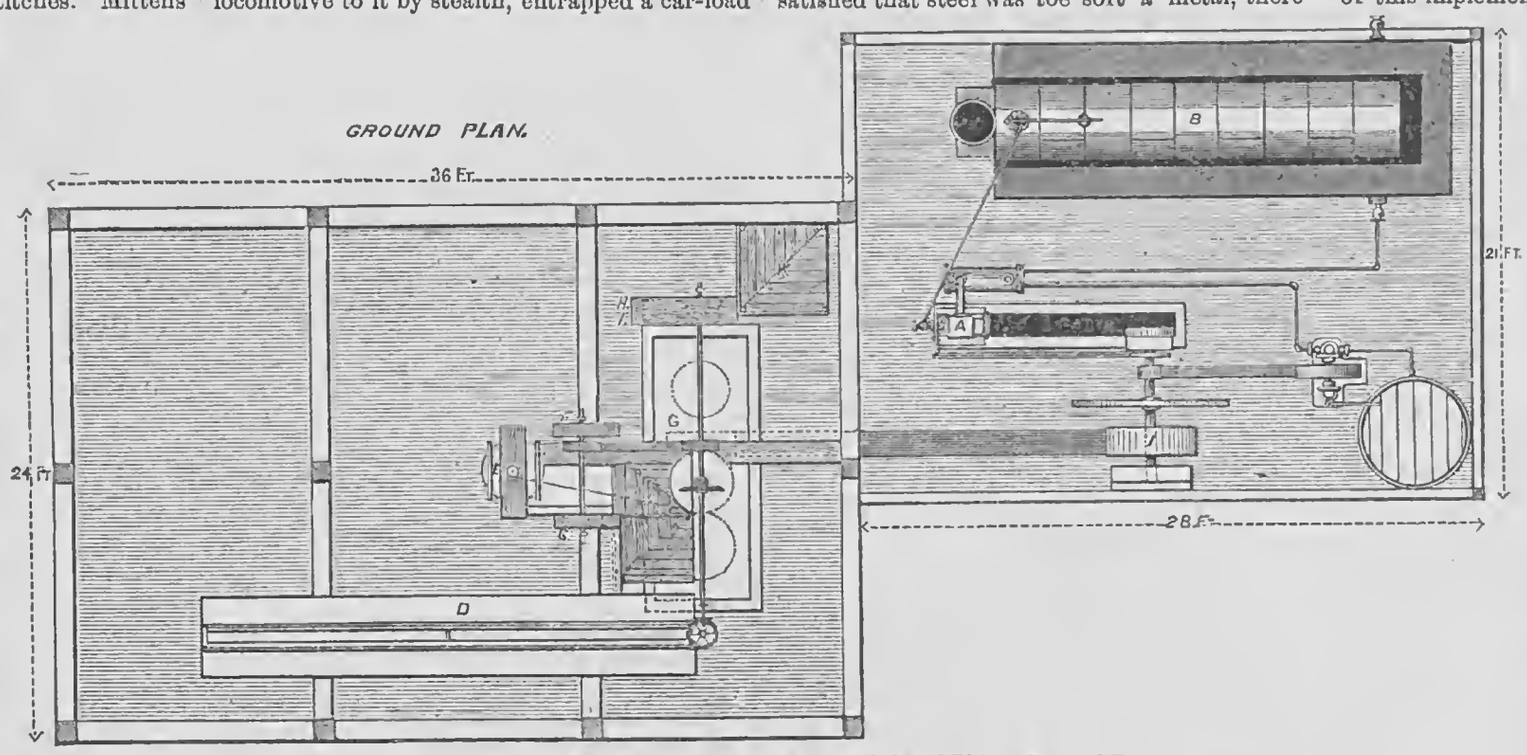
This machine has a compound motion and can be run either way, backwards or forwards. Thus the work may stand still while the cylinders revolve, or the work revolve while the cylinders stand still. Each machine is provided with a register which accurately counts every full revolution of the machine whether turned either way. Fig. 1 shows the conical cylinder or ribber in the work, Fig. 2 the ribber when thrown out of work. It is interesting to note that this is the first machine invented that successfully imitates hand ribbing work, and as usual when hand work is imitated by machinery, the product is superior to that done by the original method.

The manufacturers say that they ask the most thorough investigation of the merits of the knitter, and judging from the sample of socks shown us (and they will send a sample to any address for inspection) we think a valuable implement is offered the family. The Lamb Knitting Machine Co., Chicopee Falls, Mass., are the makers.

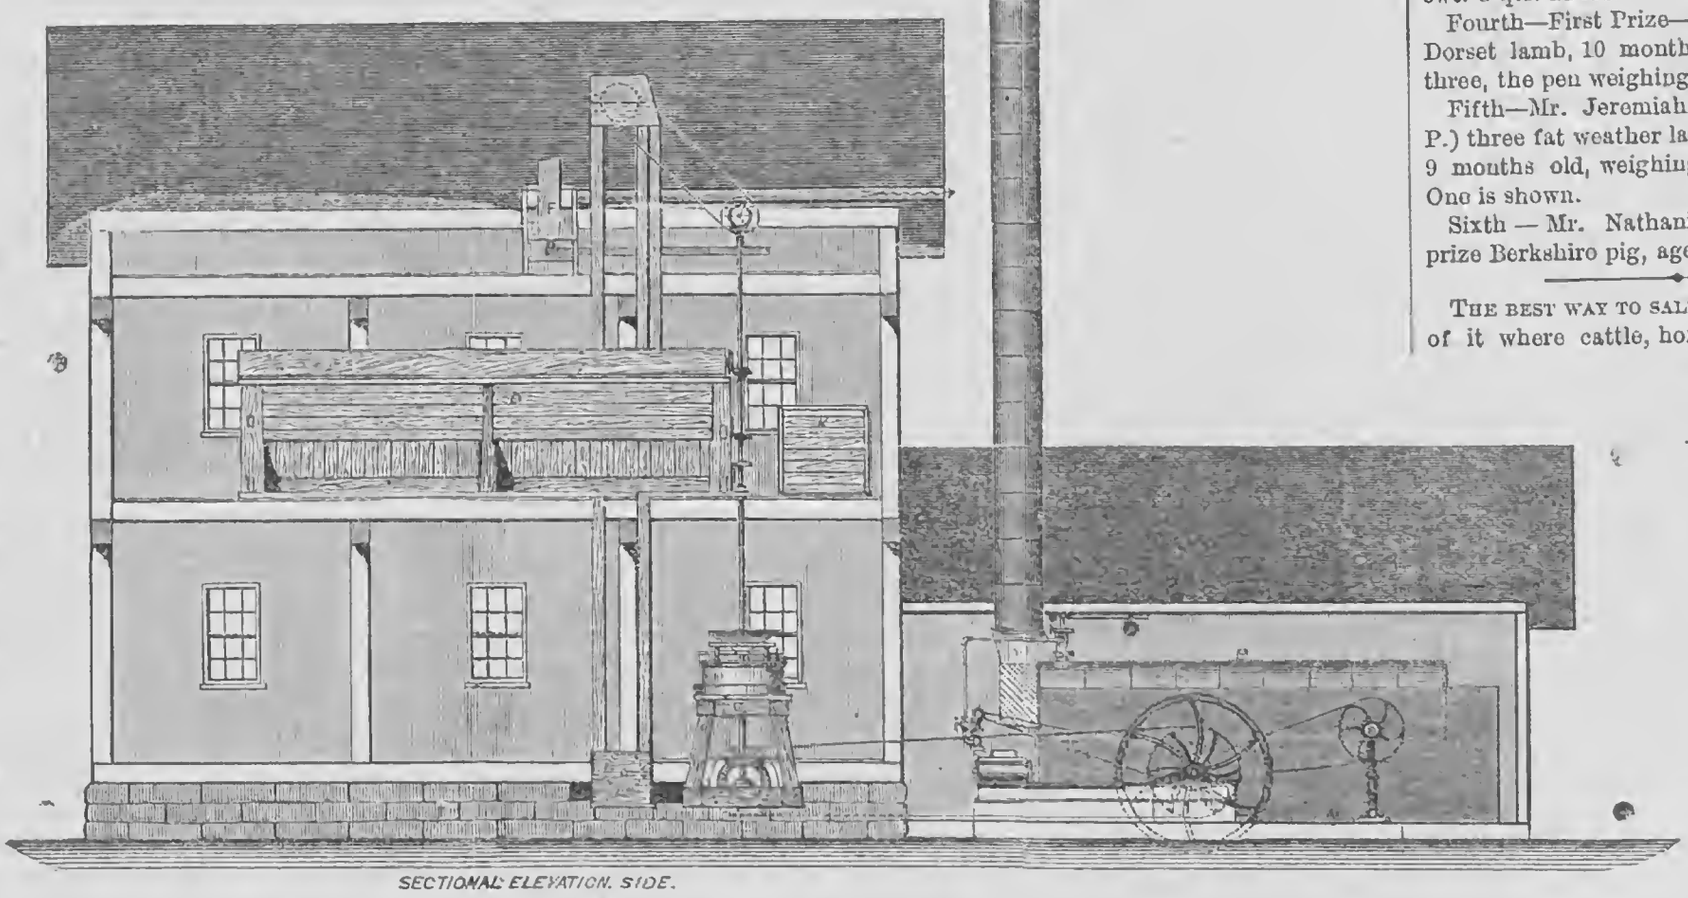
SMALL GRIST MILLS.

More or less inquiry has been excited by our series of barn plans, model farm premises, and dwelling house plans. Criticism has been active, and just sufficiently adverse to stamp the plans as these having merit. About the least anticipated request was in the line of grist mills, but we have secured the best available plan, and present in this number sectional elevation and ground plan of a steam grist mill. Those capable of forming a correct judgement will admit that the structure is well adapted for its purpose. The length and breadth are given in this plan. The hight is: foundation (stone) 3 ft. 6 in; first floor (superstructure) 12 ft; second floor 10 ft; to eaves 3 ft; to peak of roof 6 ft. 8 in; making a total hight of 35 ft. 2 in. The mill is a wooden frame structure, with an adjoining boiler and engine house, so placed in connection with the main building, that the driving belt from the engine shall connect through the center of the mill, with the two run of buhrs, the extent of the capacity of the mill. The fitting of the appurtenances will be easily followed by a reference to the letters and figures. It should be borne in mind that the side elevation as well as the ground plan does not fully show the proportions of the furniture, and their relations to each other as well as would an end elevation. We must omit the latter, however, because of pressure on our space.

The steam-engine and boiler A and B as also the water-tank occupy the small building. C represents husk, buhrs, and gearing. The smutter and separater is near the top of the main shaft. F and G, wheat and flour elevators. I and J, corn and corn-meal elevators. D, bolt and gearing to drive it. K, corn-stock hopper. The pulley on driving shaft in leash, makes 174 revolutions; upright shaft, 140; horizontal shaft 61; upright shaft driving belt, 39. We are under obligations to the Bradford Mill Co., Cincinnati, Ohio, for the plans from which these cuts were made, but the estimate of cost, which we are assured is very low, was forgotten, and up to time of going to press not received.



SMALL GRIST MILL—GROUND PLAN.



SMALL GRIST MILL—ELEVATION.

A NEAT LITTLE PLOW-WOW.

One Dickson, front initials H. B., who lies in wait about Indianapolis to sell good plows to those farmers who have been frugal and saved their money, was recently attacked by an idea. He sent out a summons to about all the plow agents he knew, and whose appetites he could rely on, to meet him at a certain time, and he would do something to them This wily, bad man then craftily secured a palace car, hitched a locomotive to it by stealth, entrapped a car-load of friends, and seating Mr. E. C. Murphy, assistant manager of the I. P. and C., on the safety valve, started for South Bend, Ind., as if he had a note to meet.

Arrived at South Bend, the astonished company saw a train of 30 cars containing 5000 chilled plows, representing $50,000 at manufacturer's prices, and all designed for the Indiana trade alone. Mr. Dickson, (the general agent for Indiana), introduced everybody to everybody else, and agents of the "Oliver" plow had their ideas in the manufacture of plows enlarged, as they traversed the most extensive plow-works in the world. By this time the company were thoroughly "chilled," and they assembled to discuss an ample bauquet. At its conclusion speeches were made. The speeches were—well, we will not expatiate on the subject. One gentleman had the good fortune to corner Mr. Oliver, the inventer of the plow, and heartlessly drew from him the following, explanatory of his earlier struggles and final magnificent success. He said:

"I was born at Roxborough, Scotland, in 1823. I came to this country in 1835, settling in Geneva county, New York. In 1836 I came to St. Joseph county, and settled in Mishawaka, where I followed my trade of molding. I continued the business, largely increasing the capacity of my first foundry, until 1855, when I was convinced that South Bend was a better point for manufacturing, and in the spring of that year moved to this city and laid the foundation of what is now the South Bend iron works."

"In 1861 my foundry was burned down, but it was soon rebuilt, and in 1864 everything was for the second time swept away."

"For 25 years preceding 1870, experiments had been made in chilling iron, and they were very successful so long as they were confined to small pieces of metal, but when the dimensions exceeded six square inches of surface it was marred with blowholes and soft spots, which rendered it entirely unfit for the use intended. I became satisfied that steel was too soft a metal, therefore I determined to experiment with chilled metal until I was able to produce a surface perfectly chilled, large enough for a plow mold board."

"I was able to produce a mold by casting in two parts and uniting them together. So you see I had fought and gained half the battle, and determined to continue the experiment."

"My first success was secured when I adopted the plan of using hot water in the chills, which dried the moisture within the flasks and prevented the blow holes. My next was a method of ventilating the chills by grooves along the face of the mold, which allowed the gasses that form within the flask, when the melted iron is poured in, to pass out, and the liquid metal to come in direct contact with the face of the chill, all over its surface; this removed all the soft spots in the mold boards and left the surface smooth and perfect."

"But the crowning success was the discovery of the annealing process, which deprived the metal of its brittleness, and then, for the first time, I could cry "Eureka."

"For a number of years we did a general foundry and machine business, until 1871, when we commenced to abandon all other branches, a new company was formed and a specialty made of the manufacture of the "Oliver Chilled Plow." Since 1873 the entire works have been employed exclusively in the production of these plows."

Mr. Pine the courteous secretary of the company, was bristling with statistics, but we are not willing to put on record the number of plows that are to be made for this year's trade, because the announcement may induce farmers to buy a chilled plow, and this would disturb the calculations of the company. Some people are just sufficiently obstinate to attempt to spoil well laid plans. One would think that the company had all they could attend to in the plow line, but they are irrepressible, and now we have to welcome among the new comers, "Oliver's Review" which tells all that it is necessary to know about the great plow.

THE ALBANY CORN PLANTER.

Our old subscribers knew the main features of this implement from the description and illustration given in the Rural of May 19th, 1877.

Since then the planter has been enhanced in value by the addition of an improvement which inables the farmer to sow corn perfectly both ways. A slide in the tube through which the corn passes (worked by a spring attached to the right-hand handle of the planter,) enables the operator, after marking off his feed one way, to drop his corn exactly in hills. This planter is, we believe, the only low-priced implement that can sow both ways. Notwithstanding improvement, prices for 1878 have been reduced. O. H. P. Cornell, proprietor of the Albany Agricultural Works, Albany, N. Y., is the manufacturer.

The Dexter spring is something entirely novel and good. We would suggest that our readers examine its claim to superiority carefully. The circular sent free by the company is, of itself, a work of art.

H. G. Loomis, Hartford, Conn., has invented a combined Level, Plumb and Engineer's Gauge which is quite convenient for use in laying drains, determining levels and making gradients for building purposes, and laying out roads, setting fences, etc. It is as efficient in inexperienced hands as the surveyer's level.

The Herdsman.

PRIZE-WINNERS AT THE SMITHFIELD CLUB CATTLE SHOW.

(See Illustration on first page.)

Our first page engraving represents several of the animals to which prizes were awarded at the eightieth show of the Smithfield Club of London. We should like to see some of our own cattle exhibitions patronized as is the Smithfield in England. On one day nearly 45,000 persons paid for admittance (one shilling.) Our illustration, which is reproduced from the Sporting and Dramatic News of London, shows—

First—The Duke of Roxburgh's second prize Scotch Highland ox, 4 years 11 months old; weight, 18 cwt. 3 qrs. 12 lbs.

Second—Champion prize (72 catalogue): Mr. Catchpole's of Ipswich Pride of Thorndale, 3 years 7 months old; weight, 18 cwt. 0qrs 22 lbs.

Third—Mr. S. Plummer's first prize West Highland mountain sheep. Only one is shown in the sketch, but the pen of three weighed 5 cwt. 3 qrs. 24 lbs.

Fourth—First Prize—Mr. Herbert Farthing's Dorset lamb, 10 months 3 weeks old. One of three, the pen weighing 4 cwt. 2 qrs. 14 lbs.

Fifth—Mr. Jeremiah James Coleman's (M. P.) three fat weather lambs, South Down breed, 9 months old, weighing 3 cwt. 3 qrs. 13 lbs. One is shown.

Sixth — Mr. Nathaniel Benjafield's second prize Berkshire pig, aged 14 months 5 days.

The best way to salt stock is to keep a tub of it where cattle, horses and sheep can have access to it at all times whether they are in the pasture or in the barnyard. Then when the appetite calls for a little of it the animals can go straigh and get it, just when it is needed, and when it will exercise the best influence on digestion, or any part of the system. When cattle are salted only occasionally there is often a great rush to obtain it, when they really feel the need of it, and an animal will injure itself by consuming at one time enough to have satisfied its natural appetite for several days, could it have the salt when it wanted it. Experience has shown that by the plan suggested really less salt is consumed than when the animals have access to it only once or twice a week. If the salt is thrown on the ground, much of it is trodden under foot and wasted.

Domestic Economy.

CONDUCTED BY EMILY MAPLE

SUNDRY SUGGESTIONS.

When a house is being plastered, if the floors were previously covered to the depth of half an inch or more with sand, a great deal of extra work in removing stains and cleaning could thus be avoided. Straw, although sometimes used, will not answer the purpose, but sawdust will, I think. When plastering, the wood-work is always more or less spattered with lime or mortar which it is tedious to remove, unless one knows the easiest way, which I have found to be by rubbing it after it becomes dry with coarse sand-paper and then with a finer quality—washing is then unnecessary.

With a pair of scissors trim the frayed edges of Arctic overshoes every week or two, and they will be much more presentable.

Housekeepers who have never used a covered dish of any kind for roasting turkeys, chickens, and other meats as well as beans, can little realize what a blessing to housewives are the covered bakers now in use. I see no reason, however, why they should be held at such exorbitant prices as are those of one particular patent, as they are very simple, such as any tin-smith can make. Many of us can remember with pleasure the savory dishes prepared by our mothers or grandmothers, and baked in the old-fashioned Dutch oven before the fire-place, and will hail with delight the advent of the covered bakers which possess the merits of the aforesaid oven while being applicable to stoves.

Julia M. Wheelock.

DOMESTIC RECIPES.

Orange Pudding.

Three pints of milk; seven heaping tablespoonfuls of sifted corn-starch; yelks of four eggs; salt, flavor and sweeten to taste. Peel six oranges; cut into fine pieces and remove the seeds; lay in the bottom of a deep pudding dish; sift over as much sugar as required; when cool pour over the oranges the corn-starch; beat the whites of the four eggs; add two tablespoonfuls of sugar, flavor, spread over the top of the pudding; place in the oven until the meringue is of a delicate brown. Although this recipe seems simple it requires care in putting the ingredients together. First, let the milk come to a boil; add the corn-starch which has previously been dissolved in a little cold milk; boil until it thickens; take from off the fire and stir in the well-beaten yelks, the sugar and flavoring; return to the back of the range for a few minutes—stirring constantly; when again taken from the fire, beat the corn-starch until it is cool enough to pour over the oranges. This constant beating prevents the corn-starch from being lumpy. The meringue should not be made until the pudding is ready for it to be spread over the top and placed in the oven.

Orange Cake.

Two cups of sugar; the yelks of five eggs; the whites of four; one-half cup of water that has been boiled—it must be cool when used; one-half teaspoonful of soda and one of cream-of-tartar; the grated rind and juice of one orange; two cups of flour. Bake in layers.

Jelly.

Beat the white saved from the cake to a stiff froth; add powdered sugar until like a stiff icing then stir in the juice and rind of one orange. Over the top layer rub lightly with the white of an egg and cover quite thickly with powdered sugar.

Mrs. D. Snedeker.
Brooklyn.

Chicken Croquettes.

One large chicken; two sweet-breads; two ounces of butter; one wine-glass of milk; one loaf of stale baker's bread; pepper, salt, parsley, onion and two eggs.

Boil the chicken and sweet-breads separately until tender—saving the chicken broth. Chop both together very fine; season with pepper, salt, parsley and one teaspoonful of grated onion. Grate or rub bread until you have equal quantities of crumbs and chicken. Take as much chicken broth as will moisten the crumbs; add the milk, butter and let boil; then stir in the crumbs, mix with the meat and when sufficiently cool, stir in the two eggs, well beaten. Mold into croquettes; roll in crumbs or Indian meal and fry in lard.

Oysters on the Half-Shell.

Put one pint of oysters with liquor into a stew-pan; add a gill of water; let come to a boil; take off from the fire and strain through a colander. Into a sauce-pan put two tablespoonfuls of butter; two and a half tablespoonfuls of flour; place over the fire and stir until the butter melts; pour in half the liquor from the oysters and stir until it thickens; take from off the fire and break into it two eggs—one after the other quickly; season with pepper, salt and a teaspoonful of parsley; mix well; add the oysters and remaining liquor; boil one minute. When cool put on the half-shells; sprinkle with cracker-crumbs and bake until nicely browned.

Potatoes.

One and one-half pint of mashed potatoes; yelks of four eggs; a small piece of butter; one-fourth pint of milk; season with salt, pepper and stir in the well-beaten whites of the four eggs the last thing. Bake in the oven until brown.

Snow Pudding.

One-half box Cooper's gelatine soaked ten or fifteen minutes in four tablespoonfuls of cold water; then add a pint of boiling water, the juice of two lemons, and one cup of sugar. Strain it and set away to cool. When cool—not stiff—add the well-beaten whites of three eggs; mix thoroughly and pour into a mold and cool.

Custard.

Take the yelks and about one pint of milk and make a soft custard; sweeten and flavor to taste, and when the pudding is turned out of the mold pour over the custard.

Bavarian Cream.

Dissolve one ounce box of gelatine in one and one-half pint of milk slowly; when scalding hot, stir in the well beaten yelks of three eggs, four tablespoonfuls of sugar; let it boil ten minutes, then stir in the whites beaten to a stiff froth; add a little vanilla. Let it cool slowly in a mold. Eaten with wine, milk, or cream.

Apple Jelly Cake.

One cup of sugar, two tablespoonfuls of butter; two eggs; one-half cup milk; one-half teaspoonful soda and one of cream-tartar; two cups flour, and a little salt. Bake in layers.

Jelly for Cake.

Two apples pared and grated, one cup of sugar, juice of one lemon, beaten white of one egg.

Cocoanut Drops.

Grate the cocoanut; weigh it; take half the weight in fine sugar; mix together and form into little balls. Bake them in a hot oven; when they begin to brown, they are done. Before baking, dip the bottoms of the balls into flour.

Brooklyn. Mrs. Williams.

Correction.—One-half pound of butter was omitted in Mrs. Bart's recipe for "Cheap Fruit Cake" in the Rural of Jan. 5.

Everywhere.

EASTERN SHORE OF MARYLAND.

J. W. KERR.

MISTAKES OF NEW SETTLERS.

Denton, Md., Jan. 3, 1878.

In the Rural of two or three weeks back, an article from one of its able Western correspondents, Dr. Williams, presents a graphic pen-portrait of the manner of procedure of immigrants from the North and East, that I have seen the twin-sister of here, and that, too, with feelings mingled with deep regret.

Many persons coming here to settle from Northern and Eastern States, where the price of land ranges much higher than here, are far from content with buying what a portion of their available capital will pay for. The renovation and improvement of a run-down farm are, in their estimation, a matter of trifling importance—the greed of acquisition blinds their vision, and instead of purchasing one farm and paying for it, *two* will be bought, half of each paid for, and the balance mortgaged. Situated thus, with a lot of poor land, no cash, no means to improve, and the time approaching for payment of mortgages, the inevitable result soon stares them threateningly in the face.

Two or three years of hard toil, followed by withering mental anxiety and remorse, and they return to their friends, wiser and poorer than when they left them. In some instances, failures of Northern families here are attributable to other causes. For example, there is the hard-headed, practical farmer who settles among us; he will tell us this book-farming is nonsense, "the men who write it hardly know a calf from a Guinea pig," etc., etc. He brings his heavy Northern plow along, and gives this thin, light soil such a thorough (?) plowing as it never had before. If there is any clay in the subsoil, he has the benefit of four or five inches of it on top. The corn he plants is differently educated, and stubbornly refuses to make oars under the treatment; but, says Mr. Hard-head, "my plan is right, and I'll stick to it; this lazy, half-way plan of farming I never liked." And thus he argues by word and work, until a depleted purse arouses his affections for his former home, and disgusted with the country and inhabitants, he quietly makes his exit.

Now I believe in thorough and modern farming, as practiced by the educated, skillful, and successful farmers of the North and East, and at the same time I frankly own that the greater portion of this Eastern Shore of Maryland, is many years behind the North in point of agricultural improvements and practice; but for this there *was* a cause; that cause is removed, and our farmers have procured tickets for the car of agricultural improvement and all its fascinating concomitants. Some are already seated in the substantial vehicle, others on the way to the station, while some are only donning suitable apparel to make them passable in the crowd; but "improvement" is the inspiring watchword of all, spreading, prolific, contagious improvement.

RURAL SPECIAL REPORTS.

Syracuse, N. Y., Jan. 4th, 1878.

Old January is singing,
And his voice is hoarse with cold;—
But, hark, to the joyous ringing
Of that merry shout and bold,

'Tis the wild, free-hearted laughter,
Of a merry group at play;
The music that followeth after.
The toils of the studious day."

Winter appears to have come at last! Yesterday morning the thermometer stood at six degrees below zero. To-day at noon—it stands at 22 above, wind east, and snowing fast. There is a fair prospect of sleighing, which is highly desirable as the roads are in a horrible condition, and in consequence business is not lively. Up to the 28th of December, the weather, was mild with only slight, occasional frosts. This shortens our winter materially, which is a great benefit to poor people. If farmers are not prepared for winter now, it is due to their own neglect, as the season has been most propitious, This is a very important season of the year, financially to us all. Payments come due, and interest—which "draws harder than a blister"—must be provided for, taxes must be paid, subscriptions to the paper, especially for the Rural renewed, church rates paid, insurance policies attended to, yearly dues to the Masonic, and other benevolent orders, settled, extra winter clothing bought, and last but not least, holiday presents for family and friends procured. Verily, it needs all of one's wits as well as a good share of one's spare cash to meet all these obligations, coming as they do in a lump. I think farmers generally are able to settle all the bills with a cheerful countenance, as the past season has been an uncommonly fruitful one. N. R.

Howard Lake, Minn., Dec. 29, 1877.

Minnesota has of late, changed her weather tactics very materially; for contrary to her established rule for winter—which is snapping cold weather, and plenty of it, with much sunshine and few clouds, and an abundance of snow—she has been giving us mild, foggy weather, with much wind, mud and rain, and as a consequence, the roads are anything but good. So frequent were the rains, that the week before Christmas—much to the disgust of housekeepers—it was impossible to dry clothes in the open air during the entire week, and many washings remained wet on the line for ten days, except as they were taken into the house to dry. Such continuous rain has never been known here before at any season of the year. There may be, after all, a blessing in disguise in this warm weather, as the seeds of weeds and other hardy plants are springing up in abundance, as if it were spring-time, and just so many less will the gardener have to contend with another year. Farmers here generally are prosperous and happy, and realized good crops of grain and vegetables, though to secure them they had a desperate fight, last spring, with young grasshoppers. Apple crop not so good as last year. Only a few varieties raised here. This town is situated in the Maple woods, nearly forty miles west of Minneapolis, on the St. Paul and Pacific R. R. January 3, 1878, our mud is frozen and a light snow has fallen. B.

University of N. C., Jan. 8.

After a mild autumn and December—a few days excepted—we are at last realizing that it is winter. So far we have had only a sprinkle of snow, but it has been exceedingly cold for two days. The ice is an inch and a half on the ponds to-day, and the lovers of skating have had the first sport of the season. Owing to the wet season, the farmers were unusually late in sowing wheat. This may not prove a loss. Some years ago I began about the usual date and finished sowing but a little while before Christmas. The first and last pieces were about equally good, and both much better than the others. The experiment showed that the soil and culture were more important than early or late sowing.

As an item of general interest, I will state that our Department of Agriculture purposes to issue a special number of its organ, the Farmer and Mechanic, on the 17th inst., in behalf of immigration to this State. They will publish 12,000 extra copies, for distribution in the Middle and New England States. The Governor, the State Geologist, the State Chemist, and other distinguished gentlemen will contribute articles.

Our State Chemist, Dr. A. R. Ledoux of New York, has recently brought his excellent and accomplished bride from your city; and they, each and both, have taken a warm place in the hearts, and a high place in the esteem of all our community.

May a kind Providence crowd the New Year with blessings to you and your readers!

A. W. M.

Syracuse, N. Y., Jan. 5, 1878.

I was highly pleased with the editorial, in Rural of Dec. 15, entitled "When to Stop." We are troubled with the same class of people in this vicinity. When one of these long-winded persons does finally stop, one feels like exclaiming in the language of the poet:

"The speaker's voice is hushed at last—
There was no more to tell,
And from the weary audience
There arose a grateful yell."

But there is another class of speakers, just as objectionable and provoking. I mean those persons—not hard to find—who seem to sit with their feet well under them, ready to spring up and speak upon the slightest provocation. They remind one of a "Jack-in-a-box," so constantly are they bobbing up and down. I lately attended a meeting of a State organization—no need to say what the organization was, or when held—where a man of this class—whom for convenience I shall call Mr. H.—made himself conspicuous.

Notwithstanding the fact that there were a score or two of good speakers, whom all wished to hear; this irrepressible gentleman managed to occupy about one-third of the time. No sooner did a speaker resume his seat, than up sprung Mr. H., quicker by at least half a minute, than any one else in the room, with a "Just one word Mr. President," or; "I wish to drop a single thought right here." Presently down he would sit again, but always ready for another spring, until some one else had spoken, then up he would come again, with one more thought, or just another word; varying the programme by rising to explain what he had previously said, "for fear that some one in the room had misinterpreted his meaning;" or to "suggest" that another name be added to some committee, etc. etc. etc. No question was, or could be raised upon which he could not throw some light no subject started that he could not instantly comprehend. It is simply astonishing how much he knew—taking him at his own valuation.

It is hard to be compelled to sit and listen to one of those interminable talkers, but this *can* be endured; while one of these "Jumping-jacks," who is upon his feet one half of the time, and who rarely says anything worth listening to, provokes me beyond my powers of endurance. Nelson Ritter.

Jonesville, Saratoga, Co. N. Y., Jan. 4, 1878.

The weather in this vicinity has been remarkable for two months past. I think that the oldest inhabitants do not remember having seen so warm a December. Until within a few days the ground has been frozen but slightly. Dec. 25-26-27, 1877, will be long remembered as the days of a "Frost storm." The wind was northeast; the sky cloudy; the trees, grass and ground covered with white frost, and frozen vapor actually falling, even during the day, upon the earth. The prevailing wind for three weeks past has been northeast. Jan. 1, 1878 was a beautiful day, the sun shining, and the weather warm. Yesterday, January 2, snow fell to the depth of four or five inches. This morning Jan. 3, was the coldest of the season, thus far, the mercury standing at 4° below zero.

Prices of farm produce as follows: Oats 35 cents and 40 cents; rye 75 cents; corn 70 cents; hay $10 to $12 per ton; potatoes $1,25 and $1,50 per barrel; butter 25 cents per lb. The apple crop was a total failure, hardly a farmer has apples in his cellar. Generally crops of the last season were abundant. F. B. W.

Pittsfield, N. H., Jan. 5, 1878.

The weather was very mild and rather moist during the latter part of the year just closed. Mercury did not go below ten degrees but once in that time, In central N. H. there was not snow enough for good sleighing, and some farmers have kept stock in the pasture all the time excepting two days. All young stock and sheep having the choice of filled racks and pasture, have invariably chosen the latter, during the day, which has materially aided those farmers whose quantity of fodder was small. The outlook for the hay crop next season is good. Live stock sells low. Lumber business is improving a little. No change otherwise. 1877 died a lamb, 1878 was born a roaring lion. Two snow storms and mercury six degrees thus far.

G. R. D.

RANDOLPH, Orange Co., Vt., Jan. 7, 1878.

The New Year has brought a plentiful snowfall; December was a glorious month; it seemed like delightful October, with the sunshiny, yellow days, and genial atmosphere; but we are having a decided change. The thermometer to-day is 12° below zero, and on the streams went down to 30°, making pretty stinging, winter weather. The farmers are getting ice into their ice-houses and it is much better than that of last year; there are no bubbles in it, so it will be likely to keep well. Produce of all kinds is very low in market, and no prospects of brighter days, at present. The season is very healthy, there are no epidemics of any kind prevailing, and as health is a great promoter of happiness, every one should be happy. R.

ELDORADO, Cal., Dec. 27, 1877.

The blessed rain came at last, rain fell all over the State Saturday and Sunday varying in places from ¼ to 1½ inches. Apples are rotting fast, (perhaps decaying would have been better); those happy enough to have a small quantity on hand are disposing of them at fair prices as fast as possible. Tree planting has commenced. From now to April it will be all "the go." By the way, one man of our town says he doesn't like Eastern trees; they have a habit of getting up and walking off, roots and all. If you see any stray trees walking about, chain them down until a warrant can be sent after them, as some of his may have gone back. W. C. L. D.

HOUSTON, Texas, Jan. 6, 1878.

For about three weeks, until New Year's eve, we had quite warm weather with copious rains, thermometer ranging from 65° to 75°. Since New Year the "northers" have prevailed, and bring us occasionally night frosts. The ground is so soggy that not much can be done in preparing the land for planting. This is the time when generally the first potatoes are put in the ground. Sometimes they will freeze down after they are up, but they usually sprout out again if the seed-tubers are not cut too scant, For spring-planting, we use exclusively Northern raised potatoes. G. M.

Veterinary.

VETERINARY.

FLAVEL S. THOMAS, M. D., F. M. M. S.

ISSUES ( )

I KNOW that I am not doing as I promised I would, but if you will allow me one article more I feel quite sure that I shall be ready to take up diseases and treatment of domestic animals. I have so much fault to find that I can't put it off. In fact I may call this my first article on diseases of animals.

It seems to me very strange, when we hear so much about the "issues" on hog legs, that anatomists have not studied these glands more than they have. They were found or first spoken of by MULLER but that was many, many years ago, and I have found no description by him that shows a thorough dissection. He was a German, and his writings are mostly contained in archives with no index, so it is hard to say just what he has done, until it is hunted up, which would be an immense work, as there are quite a number of volumes containing articles on zoology, anatomy of vertebrates and invertebrates, with no index and without classification. OWEN, in his Anatomy of Vertebrates, TODD in his Cyclopedia of Anatomy and Physiology, MIVART in his work on Anatomy of Vertebrates, HUXLEY in a similar work, all have long articles on glands, and glands of this nature especially, yet none of them seems to know that there is such a one as this of which we are now writing. CHAUVEAU just mentions it but does not seem to be at all acquainted with it. He speaks as if he had read that there was such a gland, but had never examined it himself. In no work on Veterinary Medicine or Surgery have I seen anything about it, and I have studied thoroughly WILLIAMS' Medicine and Surgery DODD and others. But I will make one exception—In COLE'S little book, the American Veterinarian—he speaks of the Issues and their Treatment. He says:—"They have issues on the inside of their fore-legs, just below the knee, which are porous like the top of a pepper-box." This is quite a good description, only they are above instead of below the knee, and to say that they look like a pepper-box is hardly in my mind correct, as they are an oblong oval in shape and have only from one to four openings placed apparently at haphazard, irregularly over the surface. I intend making the anatomy and physiology of this gland a subject of study, and work out what seems to be nearly wholly unknown. Any one knowing of any writings on the subject will greatly oblige by sending me word.

I have spent some time on it now. I find it to be from three-quarters to two inches long, one-half to one inch wide, stands out about one-third inch from the surrounding surface. It is easily detected on removing the skin, as it is of a yellowish-brown color and has a glandular appearance. I don't care to make further statements until I have completed my investigations.

But why I spoke of this, at all, was to beg owners of hogs not to allow any one to clear the "eyelet holes" of their hogs with knitting-needles. A fine probe can be thrust but a short distance into these openings yet the "neighborhood cattle doctor" will thrust a needle two or three inches through the substance of the gland and the flesh to clear the "eyelets." If you wish to clear them, do it with soap-suds and a cob, rubbing the skin over the gland well with this. It is supposed that hogs don't sweat as other animals do but that the perspiration passes off wholly by these glands. I am not prepared at contradict this. I will admit that it looks as if the stopping of them does produce sickness. I hope within a year to be able to make known the results of my investigations and trust that they may guide us hereafter in the diagnosis and treatment of diseases peculiar to swine.

The Poultry Yard.

THE LIGHT BRAHMA FOWLS.

T. B. MINER.

As the origin of the Light Brghmas, and their original native country, are questions of interest to fowl-breeders, I will say that the statements of Mr. WALLACE, in the RURAL of Dec. 29, cannot be considered as proofs of his allegations. He says, "I saw a pair of Light Brahmas fifteen months before the original pair came to the United States," which would have been in June, 1846, the first ever seen in this country being found on board an India ship in September 1847. He says that the pair he saw in 1846 were in possession of "a Captain Stewart of Sea Mount, Ireland." Now, not a "Brahma" fowl existed in the whole world of that *name* till 1852, having been called "Chittagongs" mainly in the United States, excepting a few breeders, who called them "Gray Shanghaes," which was a gross misnomer. The Chittagongs somewhat resembled the Light Brahmas, and as they had no name when originally introduced, they were so called till in 1851 my old friend, Dr. J. C. Bennett of Great Falls, N. H. conceived the idea of naming them "Brahma Pootra." I urged him to lop off the "Pootra," after his name had become pretty well established, and also strongly advocated this change in my paper, the Northern Farmer, published in Utica, N. Y.; and by 1855 I succeeded in causing the name to be simply "Brahma."

Now, it would be interesting to know what name Captain Stuart's "Light Brahmas" had in 1846—five years before the name existed! In the spring of 1862, Dr. Bennett sent the first pair of light Brahmas to England ever seen there, or in any part of Europe, according to his claim, which I have never seen *authoritatively* contradicted. This pair were sent to Mrs. HOSIER WILLIAMS, Eaton, near Shrewsbury; and the Doctor sent me her acknowledgments of the receipt of the fowls, which letter I published in my Domestic Poultry Book, which I was then compiling. In closing she said: "I am, indeed, not a little proud to be the only possessor in *Europe* of this breed of fowls." This, please note, was five years after Mr. WALLACE says that he saw a pair of Light Brahmas in Ireland!

A few months later, in 1852, Mr. G. P. BURNHAM, then of Roxbury, Mass., sent his famous eight specimens of Light Brahmas to Queen Victoria; and from that time onward, there was a great excitement in England in regard to "Brahma Pootra" fowls, it being much more difficult to change the name there than in this country. Orders for this breed came in with a rush from England at enormous prices. I received one order myself for a trio at *five hundred* dollars! The English papers, as well as all the poultry fanciers of that time, admitted that the only fowls of that breed ever seen in that country *came from the United States*. Now, what was "Captain Stuart" doing all these years with his genuine "Light Brahmas," if he had them? Is it reasonable to suppose that he could have had them, while all England and Ireland were making such a noise about them, and paying from $100 to $500 a trio to our American breeders? I say *no;* it is not reasonable to suppose that "Captain Stuart" had any pure Brahmas. He, probably, had the Chittagongs, which are quite as large as Brahmas, and resembled them in some respects.

Well, how about the Rev. Frenchman's "book of travels," and Dr. Hastings, "of the British army of India," whom Mr. WALLACE quotes to prove that Brahma fowls exist throughout China, India, and Siam? What do they *prove?* Nothing at all. They do not, according to the quotations adduced, even mention the name of "*Brahmas.*" Nor do they *describe* this breed in the least. Of what value is a man's testimony in regard to a breed of fowls in India or China, when he gives no evidence that he *knows the breed when he sees it?* Why, there are scores of fowl-breeders in this country to-day, who don't know the difference between the old Chittagongs, and the Light Brahma; and what evidence is there that these men, to whom Mr. WALLACE refers, ever saw a pure Light Brahma? French clergymen, and British army officers, are not to be supposed to be good judges of any breed of poultry; and much less to be able to give reliable testimony in regard to a breed of fowls, that for ten years went under a misnomer, in this country and in England. Nor, does Mr. WALLACE state the *year* in which the "book of travels" etc., were published; and from the tenor of his remarks, I am led to infer, that he quotes from memory, not having (I infer) the books in his possession.

It is very singular, if what Mr. WALLACE says is true, that the poultry press of the United States and England, during the last thirty years, did not come in possession of the alleged facts! Who ever heard, till the RURAL made the announcement, that "a Captain Stuart" of Ireland had Light Brahmas fifteen months before any appeared in this country, and that Mr. WALLACE *saw them?* And who ever saw quotations from the aforesaid French clergyman's "book of travels," and the writings of the officer "in the British army," in any American or English publication, showing in regard to Light Brahmas what Mr. WALLACE claims? If Mr. WALLACE will send me any book, French or English, that proves what he claims, I will publish the full text in this paper,—admit that I am "wrong," return the book, and send him five dollars for the use of it one week. My address is Linden, Union Co., N. J. The origin and "native habitat" of Light Brahmas have been much discussed in this country and England, and it is everywhere admitted that they were first bred in the United States, so far as their history has been revealed by any reliable authority; and all that now exist in the world, owe their origin to the pair obtained in 1846 by a Mr. CHAMBERLAIN of Hartford, Conn., through the clerk of the propeller "*Sachem*," from on board a ship at the dock in New York, the full details of which I published about twenty-five years ago; and I stand ready to *prove* their origin to be thus, against the world.

In regard to "Dark Brahmas," no satisfactory pair of them were heard of in any country, till the Light Brahmas had existed here about ten years, according to the current accounts of them (the Darks) in this country and England. Mr. G. P. BURNHAM claims to be the originator of them, and poultry breeders have never disputed his claim; and yet, Mr. WALLACE says, that in 1846 a pair of Dark Brahmas were brought into Ireland—ten years, at least, before any existed, according to their history, as published from reliable authority!

PEKIN DUCKS.

THIS variety of duck is a great acquisition, not only to the farmer or poulterer, but to the country at large. They occupy a position relative to other ducks similar to that the Asiatic or China fowls do to our small breeds of poultry. At their first introduction—a very few years since—a decided attack was made on them by many writers to poultry papers as the last new bubble or humbug. There can be no question but that those critics were generally persons who had not tested their merits, or some persons, perhaps, who expected too much of them; for, unfortunately for us all, we must keep our expectations within bounds with all animated nature, for, like ourselves, none of them are perfection. Even the goose that laid the golden egg didn't lay fast enough for her owner. Yet, on the other hand, there have been those who have exaggerated the qualities of these birds for the sake of selling the eggs and ducks at large prices, and in this eagerness for gain many Pekins have been crossed with other white ducks, and so palmed off for genuine Pekins.

The true-bred Pekin bird is of a peculiar shape; the body is heavy and well down behind, the legs carried back further than those of other domesticated ducks, while their tails are set up in a nearly vertical position. This heavy hinder-part of the body, naturally makes the bird carry its head and shoulders high, making its neck look long. The head is not quite as flat as that of the Aylesbury, while in size and color they resemble each other, being almost pure white, but the Pekin shows a tendency to a delicate, creamy, lemonish-yellow shade in its under feathering. The bill is of a bright orange color; the legs still deeper, almost bright red. Its weight should reach six to seven pounds in ordinary adult birds, but they are often exhibited much larger.

In habit this duck is much more domestic than any other, and shows less inclination to stray far away or to remain out all night. They come home very regularly, lay more eggs than any duck I have ever kept, and feed more on grass. They do not, however, grow as fast as Aylesburys, while very young, but catch up to them when three or four months old. I make most of these comparisons to Aylesburys, simply because that breed is most like them, and at the same time, next to them, has more merits than other ducks, as far as my experience goes, and I have kept other kinds for the purpose of comparison. HENRY HALES.

Field Crops.

EXPERIENCE WITH CORN.

JUST a few words about my experience with corn. Last year I bought three varieties new, at least to me.

Of Lawson's Early Yellow Field I planted one peck, the last week in April and first week in May, on land that was broken up and had been planted with corn the year before. It was plowed, dragged, and holed out by hand. From 3 to 3½ shovelfuls of hog and cow manure that had been drawn out the previous fall, were put in the hill. Wire-worms eat up one-fourth of it. The stalks grew large and the ears set from 1½ to 2 feet from the ground on long stems. Two-thirds had two ears on a stalk, a good many ears being from 12 to 15 inches long—eight-rowed. Cultivated and hoed twice; cut up the second week in September, when it yielded 75 bushels of shelled corn to the acre—no soft corn and almost no nubbins.

Of Improved Early Yellow Canada Field I planted three quarts on land that had been broken up the fall before, dragged in the spring, holed up and manured in the hill, the same as the other. Cultivated and hoed twice; planted the second week in May; showed the tassels by 25th of June; ears by 9th of July: picked a trace ripe 15 of August; yield at the rate of fifty bushels to the acre—all of it sound and ripe.

Of Longfellow Yellow Field I planted three quarts, the same time as the last; manured and cultivated the same as the above; stalks would average ten feet in hight. The ears, starting four feet from the ground, grew close to the stalk—the handsomest ears of any corn I ever saw; eight-rowed; from eight to ten inches long; most of it capped over; a good many ears smaller at the but than at the top. Ripened two weeks later than Canada; yielded at the rate of 70 bushels to the acre.

Mass. A. W. HINSDALE.

EXTRACTS FROM CORRESPONDENTS' LETTERS.

ALLEGANY CO., N. Y.

A YEAR ago we received from you one package of seed of Green-gage Tomatoes, and one of Hybrid Pelargoniums, with request that we report success. Tomato seed was sown the same day with seed of Hathaway's Excelsior—and we gathered the first ripe fruit from both on the same day, but the Excelsior has a little the advantage as it has been our favorite for a number of years, and as we always save the first ripe for seed (it ripens earlier than when we first got them). But we liked the Green-gage better than any other yellow tomato we ever raised and have saved seed of it. I have at this time thirteen fine, thrifty Pelargonium plants from that package of seed; but only about one-half of them have bloomed. In color, they are from pale rose to brightest scarlet—two now in bloom have borne the largest single flowers I ever saw; they're beauties! The remainder came up too late to bloom this year. And now I'd like to ask if the seed is always slow in germinating? Mine were all the time from the middle of March until June, coming up; and in the time I scratched out a number and picked them to pieces trying to find out what was the matter. With many thanks and my hearty good wishes for the success of the old RURAL, and the Experimental Grounds.

Dec. 10, 1877. MRS. F. M. BEYER.

OUR report on Locust investigations will be very full and will bring out quite a number of new and interesting facts and will show some important laws in relation to their history and habits. We have a very large amount of material in reference to flights. That for 1877 will show, I think, that but comparatively few ever succeeded in reaching their original hatching grounds in that year, but that the greater portion were driven to and fro until they finally perished. There is, I think, very good reason for believing that swarms often fly so high as to be invisible and also frequently at night, which will explain their often mysterious appearance when nothing could be heard of their approach. This will also explain the difficulty of tracing individual swarms. I have my next Entomological Report ready. It will be devoted chiefly to Plant-lice, Corn-insects and the Oak Tortrix, and will equal in size the one you have received. CYRUS THOMAS.

THE
RURAL NEW-YORKER.

PUBLISHED EVERY SATURDAY.

Address
RURAL PUBLISHING CO.,
78 Duane Street, New York City.

SATURDAY, JANUARY 19, 1878

We earnestly request that all letters containing money, or any communication intended for the BUSINESS DEPARTMENT *of the paper, be addressed to the Editor, the Publisher, or* THE RURAL NEW-YORKER, *and not to any individual. We cannot otherwise guarantee the prompt entry of names upon our books, or the acknowledgment of money.*

SLITTING THE BARK OF HIDE-BOUND TREES.

It would seem that years of experience ought to have determined whether the slitting of hide-bound trees is advantageous or otherwise. As we stated, four or five weeks since, our own experience is against the practice, but as others of greater experience think differently we have taken some pains to ascertain the views of several of our most prominent pomologists. Mr. CHARLES DOWNING writes:

"I have had very little experience as to the slitting the bark of trees that are hide-bound; it was practiced somewhat thirty or forty years ago and I think with success; at any rate I never saw or heard any bad effects from it. A preventive and a better way is to keep the trees in a growing, healthy condition, by good cultivation, and wash the bodies and large branches with soap annually at the opening of spring."

In a valuable essay (one of our series) by Professor THOMAS J. BURRILL of the Illinois Industrial University of Urbana, which we shall shortly publish, occurs the following:

"Under the impression that the trees were "bark bound," men have ruthlessly slit the covering of the trunk from top to bottom, and seeing the cut gaping wide from the shrinkage of the tissues, the diagnosis is considered sustained and the savage treatment vindicated. Had they noticed that all such slits, even more marked in the healthiest trees, were followed by the same results, and especially had they bethought themselves that this shrinkage is a necessary consequence of the fundamental laws of structure and growth, the demonstration would not have appeared so satisfactory. It is, however, more surprising to see the process recommended in a recent publication by one who certainly ought to know something of vegetable physiology. The fact is, cuts and wounds are serious things, and should be avoided except for well-considered reasons to the contrary."

PROF. BEAL answers our inquiry as follows:—"I do not think I ever saw a tree which I thought was benefited by slitting the bark. I do not believe in *hide bound* trees. The difficulty is somewhere else, generally at the roots. I confess, though, that I have not given very careful attention to the subject."

Other communications bearing upon this subject will be presented next week. Meanwhile, we shall be pleased to hear from those whose experiments in this matter entitle them to an opinion.

VALUE OF THOUGHT.

IT is not the intense thought of the philosopher and inventor—that thought which has created civilization and revolutionized industry—that is here referred to, but the head-work of which every man is capable in the ordinary affairs of every-day life. The capacity for such thought, however, is seldom a measure of its practice, for thousands who *can* think, *don't*. This widespread thoughtlessness is the fruitful parent of blunders, errors, loss, improvidence, blighted hopes, regret, and too often alas! of crime; for evil comes from want of thought as well as from lack of sense. How often are mishaps and disasters, due mainly to our own heedlessness, excused or bemoaned with reflection, "I never thought," or, "Oh, that I had thought!"

It has been well remarked, that the main difference in mental processes between man and the rest of animal creation, is the inability of the latter to foresee that certain results will follow certain causes. Although raised high above the remainder of animated nature by the gift of this faculty, yet we, through our inconsiderateness, too often fail to realize the fact, with sufficient vividness to influence our daily lives, that nothing is more inexorable than cause and effect. Hence plans thoughtfully matured and wisely laid and carried out are, barring inevitable mischances, sure to turn out well; whereas the schemes hastily undertaken and executed without reflection, have a happy issue only by accident.

There are few occupations whose conditions are so favorable to calm reflection as farming; and it is doubtful if there is any in which it can be more beneficial and profitable. Many of the labors of the farm soon become well-nigh mechanical, allowing the mind to dwell on other matters; and it is of great importance, not only to the increase and even preservation of intelligence, but also to success in life that, under these circumstances, these self-communings, instead of being muddled, vague, or trivial, should be clear, definite and serious. Nor need a farmer go beyond the limits of his own acres for interesting subjects of profitable thought. Not only do the methods of tillage, manuring and cropping best adapted to his land and circumstances, afford him topics of remunerative reflection, but also the choice of the modes most economical in trouble, time, and outlay, of accomplishing his necessary labors. The science, also, as well as the art of agriculture, should find frequent place in his thoughts, not merely on account of the interest every intelligent man must feel in investigating the causes of the effects which are either a benefit or injury to him; but also because a clear perception of the principles of his art will enable him to escape many errors and to discover fresh opportunities for their application. It is conceded on all hands, that the greatest advance in agriculture has been made since its principles have been made the subject of careful study; and what is true of the occupation of the farming community at large, is also true concerning that of each of its members.

Pre-eminent success in farming is always the result of diligent thought, and its outcome, careful system. Of two men, one remarkable for sprightly intelligence and a large fund of general information, the other greatly his inferior in capacity and acquirements, we frequently see the latter eminently successful in pursuits in which the former has either disastrously failed, or is barely making a livelihood. Careful study of the conduct of both will always show that, despite the disparity of their mental endowments, the measure of their success is invariably proportionate to the thought and system each has introduced into the conduct of his affairs. What higher proof could be adduced of the value of thought?

CONCERNING ADVERTISEMENTS.

THE advertising pages of a journal should be as interesting to its readers as any portion of its contents. The announcements in those columns presuppose wants on the part of subscribers, which the advertisers are prepared to satisfy, and the press is, or ought to be, the most trustworthy vehicle for publishing the fact.

It is undeniably true that publishers are not as careful to scrutinize the matter printed under the head of advertisements, as are editors to supervise the material which goes to make up what is known as reading pages. The reasons for this carelessness need not be stated. Occasionally undesirable advertisements creep in through inadvertence. A case in point is the announcement of Mr. LIVINGSTON that appeared in our last issue. The advertiser is well known to us, and we believe him to be responsible, but we cannot permit any one to word announcements so that the impression will be conveyed that the RURAL has any part in the business of the advertiser. This trick has been much in vogue of late. It should be discouraged because it is deceptive,

It is our earnest intention to supervise our advertising columns with the utmost care, permitting nothing to appear therein that shall mislead or work injury to our readers. We believe this due to ourselves as well as our readers. Our aim is to make the RURAL a model in its class, and we certainly shall rigorously supervise all matters that take advantage of the confidence reposed in us by our readers to secure their patronage. This policy has caused us to refuse a large amount of objectionable advertising whose money value would have been a serious loss, had not our financial position been assured. We deem it a moral duty to make the contents of the entire paper unobjectionable, and we are so circumstanced that we can afford to do it. For this reason our columns become all the more valuable to those advertisers who are trustworthy and disdain competition with spurious or deceptive wares.

NOTES.

A Preliminary Requisite.—Among the numerous subjects on which the Commissioner of Agriculture is displaying a great deal of enthusiasm, is the introduction into this country of the cultivation of coffee and tea. The stock of personal enthusiasm and serviceable energy, at the disposal of the most zealous is too limited to admit of its being frittered away on impracticable schemes, and we cannot escape the conviction that the profitable cultivation of tea in this country must, at present, be considered in this category. It has already been tried unsuccessfully, under favorable circumstances, in Florida and California, and even if the plants should be found to thrive well in any part of the country, the cost of manipulating the leaves would, now-a-days, be an insurmountable barrier to its remunerative culture. Of Chinese immigrants we have already, perhaps, enough, and even if more were introduced they could hardly compete with the cheap labor they left behind them in the Flowery Kingdom. Should the Commissoner, however, be endowed with an inventive faculty, this difficult object of his wishes might yet be accomplished, for the invention of a machine capable of superseding hand work is an indispensable preliminary requisite.

A Ton of Stable-Manure.—An average ton of stable-manure contains twelve pounds of nitrogen, eight pounds of phosphoric acid and eleven pounds of potash—thirty-one pounds in all. So states the great Rothamsted farmer, Mr. J. B. LAWES. The balance of the ton is of no fertilizing value. When this manure alone is used for grain, much potash is wasted being in excess of the needs of such crops. In this connection we call the reader's attention to the articles of Professor STOCKBRIDGE, published in the RURAL, a few weeks since. Mr. LAWES gives the following conclusions as some of the results of his life-time experience: Superphosphate alone has produced good crops at Rothamsted for thirty years. Soluble nitrogen and phosphoric acid are good for grain crops. Potash is best for root crops, grass and potatoes.

The Weather.—The weather is at all times a timely topic (a very good alliterative sentence, by the way); but, if we judge from our correspondence from all sections, never before—in ten years at least—has it made itself so extremely interesting as at present. No crops, so far as we are aware, have thus far been injured by its amiable conduct—yet, if this calmness is the precursor of terrible storms, great damage may yet be effected. We should watch with unusual interest the trustworthiness of the old proverbs, such as

If January calends be summerly gay,
'Twill be wintery weather till the calends of May.

If the grass grows in Janiveer
It grows the worse for 't all the year.

March in Janiveer
January in March I fear.

Whether they do or not!—From our own experiments recorded in these columns, and from those of others, it has long been our opinion that moles not only do not feed upon vegetables, but that they cannot subsist upon them. We are not prepared to state any opinion as to their degree of usefulness in destroying worms and insects—but we *do* know that they riddled our lawns and upset our plants last summer to an extent that made us wish that this irrepressible creature had never been born.

BREVITIES.

How many Champion Grapes are there, and which is THE Champion?

IT is rarely the case that a gratifying success is the result of anything but intelligent effort.

THE annual meeting of the N. J. State Agricultural Society will be held in the State House, in Trenton on Wednesday, Jan. 16, at eleven o'clock.

OUR readers will bear in mind that winter is slipping quietly by, and that spring will soon be upon us. Are you doing all you can to lighten the burden of spring work?

IS it true that what is innocence in a pretty girl is frivolity in a homely one? Rail against it as we will—beauty is a power, the wide world over. We sometimes think that herein lies one of the elements of the RURAL'S success!

EUCALYPSINTHE is a new French preparation distilled from the leaves of the Eucalyptus. This is said to be highly grateful to the taste as well as exhilarating and yet quite harmless. It is being largely made and consumed in Marseilles.

WE judge from what we read that the RURAL is not alone in its increase of circulation for the new year. It is a good sign. When agricultural papers thrive it is evidence that farmers are, as a class, doing well and this gives a promise of better times to every other branch of industry in the near future.

MR. MARTI writes us from Texas—"Eastern seed-potatoes sell from $1 to $1,25 per barrel higher than Western ones of the same variety and quantity. It is a well-known fact, corroborated by every experienced potato-grower here, that Eastern potatoes produce more and better tubers, and set them earlier, while Western ones grow more into stalks, and do not set the potatoes until the later stage of their growth.

WESTERN New York Horticultural Society will hold its twenty-third annual meeting in the city of Rochester (Common Council Chamber) commencing on Wednesday, January 23d, and continuing two or three days. The farmers of Western New York should be well represented at this meeting, as the discussions, &c., will appertain to subjects in which they should have a deep interest. All are cordially invited to attend.

TREES shipped by ELLWANGER & BARRY to Australia, after a voyage of 15,000 miles and being 153 days on the way, were received in safe condition. Only three in 160 were dead," MARSHALL P. WILDER'S address. This venerable gentleman desires to impress on packers and shippers of fruit to foreign lands, the great importance of especial vigilance in seeing that no inferior fruit ever crosses the ocean, thus preserving the reputation of our nation for the superiority of our fruits.

OUR New York Hort. Society held its first meeting of the new year—third anniversary of its existence—the afternoon of the 4th inst., and was attended by many horticulturists of this city and suburbs. It was presided over with much dignity by Mr. Paterson, whose good executive abilities promise to render the meetings more interesting than heretofore. Now, let all who love flowers lend their aid to this society, and let us have an enthusiastic support which will raise it to the position it ought to hold—the first of its kind in America.

BUSINESS NOTICES.

Literary Miscellany.

A SISTER'S PLEA.

FAR from the shelter of the town,
A little lass and lad
Towards the shore come stealing down.
Why should a look so sad
Touch his sweet face with pensive grace.
And hers, which should be glad?

Among the rocks they rest anon
In silence; then the maid,
"Now, *you'll* not be a sailor, John,
And leave me?" softly said.
The wistful gaze she did upraise
More strong than language prayed.

"I would have been a sailor, Nell,
Had it not been for you.
Our father toiled both long and well
Upon the boundless blue;
And though he sleeps five fathoms deep,
I'd be a sailor too!

"But mother told me as she lay
Upon her dying bed,
That I must keep by you alway,
And work for you, she said,
When she was gone, and we alone,
And win your honest bread.

"And so, my dear, I shall obey
Our mother's last command,
For I shall keep by you alway,
Yet have a helping hand
Ready to lend that hapless friend.
Whose bark may get astrand."

HER MOTHER'S SECRET.

CHAPTER V.

[Continued from page 28.]

"WILL you show me what you can do," asked Edith, "that I may judge how to begin?"

"I know nothing," the other cried, "and I don't want to learn. I had better explain at once that I am too old to have a governess, and don't mean to learn!"

"But, Miss Tressider——" observed Edith.

"I am willing to be friends, but you must let me do as I like," the other went on, pettishly. "You can play and sing as much as you like; but I cannot, and will not, be treated as a schoolgirl!"

"Then I must resign my situation at once," said Edith, in a grave tone; "I cannot take money under false pretenses."

Blanche colored and bit her lip. She had thought to govern and mold this gentle girl at will. She found it would be no easy task. Yield she must, as her father had given this alternative, or a strict boarding-school for a year.

"I have been foolishly lenient hitherto," he had said, "and now something must be done. You can never come out at all unless you receive some polish."

"I will try," continued Blanche, after some moments hesitation; and going to the piano, she selected some easy music, which she began to play without much regard to time or tune.

"Allow me," said Edith; and slowly and correctly she played it for her. "Now, Miss Tressider, try it again."

She did; and, after trials, found herself improving at once. And so it was with everything.

A little before two, Miss Tressider retired to dress for lunch. Her studies were to be only during certain hours, and not interfere with her drives and mamma's one particular visit, in which her daughter always accompanied.

Edith had made a slight change in her toilet, when a girl came to the door of her room—a very excellent one—and invited her to follow, as lunch was waiting.

Edith supposed this was another word for dinner with the housekeeper. Her astonishment may be conceived, therefore, when she was ushered into the room where lunch was laid for the master of the house.

He was walking up and down in rather a perturbed way. Lady Tressider was looking very sullen and defiant; Blanche only surprised.

"Md'lle Marechale," said the Baronet, courteously, "whenever you hear the bell ring for meals, please to come down. You are one of the family."

"Really, Sir Arthur," she faltered, "this is more than I deserve."

"Pray be seated," he answered, handing her to a chair.

And thus was Edith's situation in the family assured. The Baronet showed her chivalric respect, and every day evidenced more tenderness of manner. There was something about the girl which had completely fascinated him.

Lady Tressider hated her with all the virulent hatred of a low, vulgar, and vindictive nature. The restraint she had to put upon herself galled her to the quick.

"How you can be commonly civil to that two-faced, cunning doll!" she snappishly cried to her daughter, "is more than I can imagine."

"In the first place," said Blanche, laughing, "I must obey papa's orders. You know that he will be obeyed. And then she takes great pains with me. I am improving."

"And then the girl is so very beautiful. If your father insists on her being present when the season begins—at all events, when we are down in the country—we shall have all the young men running after her," she continued.

"She is very beautiful," sighed Blanche: "and am I so very ugly?"

"Ugly!" cried the mother, warmly; "no, my dear. But the men somehow rave about these bold beauties."

"I don't know much about it," said Blanche, and went to her lesson.

A month passed, and preparations were made for the country. Parliament was up long ago, the season was well over, but Sir Arthur had some business in town which detained him.

The second dinner-bell had rung, and Edith, more carefully dressed than usual, went down stairs quite happy. She was beginning to like Blanche. Sir Arthur was more kind every day, treating her more like a daughter than anything else; while Lady Tressider ignored her altogether, which was about the best thing she could do.

On this occasion, Edith, fancying herself late, entered the drawing-room hurriedly, but would have retreated on seeing the tall figure of a gentleman, slightly turned from her, in conversation with Sir Arthur.

"Come in," said the latter. "This is my nephew."

"Heavens!" cried the well-known voice of Royston Yorke; "have I found you at last?"

Edith reeled, and would have fallen but for his supporting her.

"Pardon me, uncle," said the nephew: "this is the young lady I was speaking of,"

"I really am ashamed of my emotion," began Edith; "but I knew this gentleman in happier day's before my sad bereavement."

"Perhaps Mademoiselle would like to retire," began Lady Tressider, white with rage.

"Nonsense!—only a surprise," said the Baronet, pleasantly. "Take my arm, and come in to dinner."

The Baronet thus put the girl at her ease, and the dinner passed off pretty well, though the lady of the house smiled significantly several times.

After dinner the ladies retired; Edith going to her own room, utterly bewildered at this amazing discovery. Doubtless he loved her still, while his uncle had shown no displeasure at his familiarity.

But what did all this avail to her, the almost nameless orphan?

While she was still thinking, she was summoned to join the party in the drawing-room.

CHAPTER VIII.

A Declaration.

"Well, sir," began Royston Yorke, as soon as the gentlemen were alone, "what do you think of her?"

"Charming!" replied the Baronet. "And I am assured by Mr. Linton, who recommended her, of excellent family, though poor."

"Her mother was a true lady. I am sorry to find she is dead. It was this that caused my search to fail," he answered. "Then if the young lady has not changed her opinions of me, sir, I am free to win her?" added Royston.

"Yes," was the emphatic reply. "I should rejoice to see so fair, so noble a girl, the future Lady Tressider."

"I am delighted you are pleased, sir."

"I suppose she does not know that though to please that old miser you took his name, you are still a Tressider?" asked the Baronet.

"I told her nothing, except that I loved her, and must come up to town to consult my uncle," said Royston.

"Well, you can tell her all now; and the sooner the better," replied the Baronet, rising, and joining the ladies in the drawing-room.

Edith was at once sent for, and came into the room, pale and thoughtful.

Royston rose and took her to a seat, where she sipped her coffee, and joined in the general and ordinary conversation.

After coffee, Royston proposed a game of chess for which purpose he took her to the extreme end, of the room, quite out of hearing.

"I am very sorry," he said, kindly and tenderly, "that you have suffered so severe a loss since I saw you last."

"It was a great loss to me," she answered, her voice quivering a little; "left, as I thought, without a friend in the world."

"You have found many," he added.

"Many; and I am thankful for it," she answered, and making a move, seemed absorbed in chess.

"I dare say you believed me both fickle and false?" he asked, gently.

"I thought you had changed your mind, as every man has a right to do," she continued; "and then my trouble came, and I had enough to think of.

"My dear Miss Marshall—my dear Edith, I will say—I was neither fickle nor false. On reaching town I found my uncle absent, and started a long journey in search of him. On the way I was taken very ill; my wound had been hastily and imperfectly cured, so that I lay a long time between life and death," he said.

"I never suspected that," she said, kindly.

"Of course not. As soon as I arrived I saw my uncle, obtained his consent," he added significantly, "and went off to find you. Your mother was dead, and none knew your address. I suspect the doctor did; but if so, he refused to satisfy me. I sought you everywhere, and then returned home to find you in the most unlikely of all places."

"It was strange," said Ethel, musing.

"Not so much so as you think," continued Royston, with a dry smile. "Did you mention my name to Linton?"

"I told my mother all about you on her deathbed," was the grave and pained reply, "and at her request repeated everything to Mr. Linton."

"And he, kind, good, generous friend," the other went on, "knowing I was Sir Arthur's nephew, sent you here. He knew first that you must win my uncle's heart, and that sooner or later, we must meet."

"If that was his motive," said Ethel, bitterly, "it was a very unwise act. Better we had never met again than that we should so soon part again. I must leave here!"

"Why?" was his amazed question.

"I may be respectable, good enough for a hired menial of a superior grade, but not to be daughter of the house!" was her firm reply. "I am not a lady, that I know of. My parentage is doubtful," she added; "but I am not called upon to reveal family woes and sorrows."

"Let us speak no more now" said Royston, gravely. "My uncle is satisfied—unequivocally satisfied. But you are agitated. Will you play music instead of talking?"

"Yes," answered Edith, glad to get from the room, and be a little more alone.

Blanche had gone to sleep on a couch, weary for want of gossip.

"On what footing will that young person be placed in my house in future?" asked the lady of her husband.

"Of the future Lady Tressider—future mistress of Longmead, which I have so long abandoned through your prejudices, but to which, in three weeks, we go," was the reply.

"Then in future," the other went on, "she will be placed on a footing of equality with my daughter?"

"No," said the Baronet, gravely; "above your daughter, as the wife of my future heir. They will be married as soon as her time of mourning is up."

The Lady Tressider sat choked with rage as he coolly said these words.

"That vulgar chit placed above my child?" she cried. "Never!"

"She is a perfect lady, which is more than ever could be, or will be, said of yourself or daughter," he remarked, himself white with rage, he knew not why,

But it galled him to hear her insulted—the child whom he loved as his own flesh and blood. Hence his departure from his usual earnest courtesy.

He said no more, but went from the room to look on at the happy lovers, listen to the music, and dream.

Lady Tressider remained behind, to battle with her anger. She knew her husband well, and that he never departed from his given word. Besides, he possessed a power over the lady whom he called his wife, which the world little suspected.

Waking her daughter suddenly, this young person sat up, and stared wildly about.

"What is the matter?" she asked.

"The matter, silly fool! That this girl has already stolen away your sweetheart! But for her, you would have been Lady Tressider, owner of Longmead, and a rich heiress," cried her mother.

"And now?" the other asked again.

"You will probably remain Miss Tressider to the end of the chapter. You will be neither a lady nor chatelaine of a grand house, nor will you have much of a fortune to attract a husband—just my fortune and what your father chooses to give you."

Blanche was up in arms now, and white with rage. She had passion, after all.

"And this white-faced girl has done all this?" she said, in a low tone.

"She has. Your father has just told me that in future she will stand higher than you in the household, as the future wife of the future Sir Royston Yorke Tressider."

"I will kill her!" said Blanch, now completely roused. "I hate her!"

"You had better not let your father hear you say so, or you will be sent to school."

Blanche leapt from her chair.

"What is to be done?" she said, hoarsely.

"Bide our time! Heaven knows what may happen!" was the cold reply.

No more was said; and after some little time, the others returning, a tray was brought in, and then all went to bed.

CHAPTER IX.

Explanations.

AFTER brekafast that day, Edith asked permission to pay a visit to her friend, Mr. Linton.

"My dear," said the Baronet, warmly, "in future you are my guest. A carriage is always at your orders, and you will only join Blanche in her studies when you are so inclined."

"That will be never, if I am asked," was Blanche's incautious reply.

"You know the alternative," said the Baronet, coldly—he never made any show of tenderness to this girl; "and unless you show proper respect to Miss Marshall, my adopted daughter——"

How the blood rushed to Edith's cheeks!

"I must find a school-mistress who will be a strict disciplinarian, and who, while she informs you in accomplishments, will also teach you to behave like a lady."

Blanche quivered, bit her lip and was about to make an answer that would have sealed her fate, but that she caught her mother's warning eye.

"I am really sorry to encroach on your kindness," said Edith, quite humbly, and confused at causing any quarrel or dissension. "I really do not deserve——"

"I should think not!" muttered my lady.

A SISTER'S PLEA.

"I insist upon your allowing me to know best!" he answered. And so, after breakfast, she drove off in Sir Arthur's carriage, leaving my lady and her daughter stupefied.

"I wish we knew more about the dear girl's family and antecedents," said the Baronet, almost mournfully. "Somewhere have I seen the face before, but it is as it were in my dreams. It awakens memories, as does the voice, and yet I cannot give them a name."

"You suspect nothing wrong?" asked Royston.

"No, nothing. That noble brow reveals a soul within glorious and good; those eyes beam with truth and beauty," he went on; "and strangely do they move me!"

Royston stared at his uncle. He had never seen his usually phlegmatic and grave relative so excited. That he was pleased with the girl of his heart was most agreeable, but he could not understand the curious and extraordinary interest he took in her.

Meanwhile, Edith Marshall had driven to the house of Mr. Linton, who was delighted to see her, and appeared no way surprised at the carriage.

"And so, sir," she said, assuming a playful mien, "you knew that Sir Arthur was Royston Yorke's uncle?"

"So you have found it out!—what then?" he answered, with a chuckle.

"Was it fair?" she answered, in a tone of gentle remonstrance, "to thrust me on them? The uncle might have thought me a scheming, designing adventuress, who went there to curry favor, win his regard surreptitiously, and then marry his nephew."

"As you knew nothing of the matter," he answered, "he cannot blame you. Does he know all?"

"He knows all, and wishes me to marry his nephew—to supplant his own daughter; and, in the days to come, be Lady Tresseder," she sighed.

"All of which you will be," he said.

"Never!" was the quiet reply. "I will enter no family under false pretences. Knowing what he thinks he knows, patronized by you, he takes everything for granted; but, knowing the truth, he would refuse me with scorn."

"But he never must know," replied the man of the world; "it would be moral suicide."

"He must know all, and that this very day!" was her firm answer.

"You are a noble girl," he said, fervently, "and shall have your own way. But hear'ee, girl; if you will tell your mother's secret, oblige me in one thing—mention no names. I have reason for keeping out of it. Tell him a story——"

"Yes; if he finally asks for the names?" she argues.

"You must give them to him," sighed the other, "and refer him to me for farther explanation."

Edith agreed; and, in a hurry to end all doubt and perplexity, hastened back to Eaton Square.

Mr. Linton rubbed his hands together.

"Now, we shall know at last! Truth is mighty and will prevail!" he said.

Edith hastened back, and reaching the house, asked to see Sir Arthur alone. She was at once ushered into the library, where the Baronet was reading. Royston had gone to his club; the ladies had visitors.

"You want to speak to me," he said, gaily.

"I do, Sir Arthur," she replied, accepting a proffered seat near him.

She had found great difficulty in mustering courage to tell the tale. It was her mother's secret, but she could not enter a family under false colors.

"You have spoken kindly to me—very kindly; you have admitted the addresses of your nephew; you have"—low, sweetly, tenderly, she said this—"treated me like a daughter."

"I regard you as such," he said, kindly. "But why all this preamble?"

"You know nothing of me. Will you let me tell you a story?" she asked.

"If it pleases you, my child," he went on.

"I do not even know my father's name," she began, never looking up once; "and hence not my own."

It was well for her she did not see the nervous start he gave, or she could not have gone on.

"There once lived a young lady," she continued, and told her mother's story.

Not once did her eyes see the listener, whose agony was terrible as the words worked their way into his brain, fixing themselves there in marks of fire. But he never spoke until she had quite finished.

"Girl," he said, in a voice so hollow and far off, she started up, and saw an agonized man staring at her with eyes that nearly started from his head, "in mercy give me the names!"—To be continued.

MAGDALEN'S LOVE STORY.

VIOLET FULLER.

"Now hush, my dearie, there's a man; your mother's a poor creature, but she can take care of her little lad yet. It will never be *she* that will sit by and see him thrashed, not for all the LANGLEYS in England!"

The speaker sat in her cottage kitchen in an armchair by the fireside, plaiting straws—a feeble, sickly woman, with a peevish expression on her thin face. She had fretted herself into ill health two years ago, when her husband died, JACK MARSDEN, the Tramley fisherman, who had lost his life coming round the headland one wild night, with his boat heavily laden with fish.

On a stool at her feet, sat the boy whose unmerited whipping she bewailed, his small face disfigured by abundant weeping.

The room had also one other occupant, a beautiful, dark-eyed girl of nineteen or twenty, who sat sewing.

She let her work fall on her lap as MRS. MARSDEN spoke, and said in a low, intense tone, "Mother, I could not help it"

"You didn't try to help it;" the other retorted. "You wouldn't care if LANGLEY broke every bone in his body—as he nearly has done, bad luck to his ugly face!"

"O hush, mother! please," said the girl, imploringly.

And yet few others, men and women, in the parish of Framley, would have been much concerned had a far greater amount of blame fallen on the head of HUGH LANGLEY, the village schoolmaster. He had come to the place a year ago, to be master of the "rector's school," as it was called. High testimonials had procured him the appointment, and indeed his attainments were all that could be desired and more than were needed for the post. But he was not a popular man with the people, being violent-tempered, haughty, reserved, and independent. He was no favorite therefore, with either rector or scholars. He was, however, of gentle birth, and had the misfortune to lose both parents at an early age. But for this perhaps, HUGO, as his Italian mother called him, might have been different in mind and manners. As it was, he seemed to be at war with all the world, having quarreled at eighteen with the uncle who was his guardian, leaving the house utterly without resources and utterly friendless. He was clever, ambitious, and determined; and yet, in twelve years, in spite of his talents, he had risen to no higher post than that of a village schoolmaster.

MAGDALEN MARSDEN had been appointed mistress of the girl's school some three months after the arrival of HUGH LANGLEY, although she was young for the position. But the death of her father had thrown the care of the family on her shoulders, and the rector, thinking her sufficiently well qualified for the situation, gave it to her on the death of the former mistress. She, like the new master, was clever and ambitious; and he soon became aware of the fact, and offered to assist her in her studies.

Perhaps the beauty and grace of the girl had something to do with this offer, as she possessed a natural refinement quite at variance with her surroundings. She thankfully accepted the offer, and HUGH found his pupil quick, earnest and unwearied in her efforts to learn. To her, he became a patient and gentle master; so these natures, so dissimilar, suited each other in this respect.

It was a lovely June evening, and the children had been dismissed for some time. The boys' room was open, and at his desk the master sat, alone. His dark, resolute face, with its handsome eyes—the only beauty of his countenance—wore a softened expression as he sat waiting for his pupil, who generally came at this hour. He was probably thinking of the beautiful girl who, for six months, had been his almost daily companion.

She came at length, in her plain stiff dress, which showed every curve of the young, graceful form, and flushed like a June rose, as the master turned and looked at her.

"You are late," was all he said, although his eyes were fully conscious of every grace which she possessed.

"Yes, I was detained at home—"

She opened her books on the desk before him, and the lesson began, but the master saw that her attention wandered. At last he laid down the book.

"You are not well, to-day?" he asked.

"Oh, yes, I am quite well," she said, quickly.

"What are you thinking of, then? Not of your lesson."

She hesitated.

"No," she said, at length.

"What of then, tell me?" he asked.

"I want to speak to you, Mr. LANGLEY," she said, suddenly. "You were very angry with my brother this morning."

"Well?" was the reply.

"You hurt him very much."

"I meant to hurt him."

"But he is so young!" she pleaded.

"Young, or old, he did *wrong*." And Mr. LANGLEY leaned his face on his hand as he spoke. There was a pause.

"Well," he asked, at length.

The girl's cheeks flushed as she answered—"could you not be a little more gentle with them, Mr. LANGLEY. TOM deserved punishment I know, but when you are angry every one misunderstands you, and if you only knew what they all say of you!" The tears sprang into her eyes as spoke.

"I can't attest to all the fools'-talk that goes on in Tramley," he answered scornfully. "If *you* stand by me I don't care who is against me."

"But could you not bear with them?" she pleaded. "They can harm you because they send all their complaints to the rector; even now, there are people who say you will not be here much longer."

"Ah, are they saying that?" and he laughed, "well, perhaps it is true."

She gave him one sad look, and then sat with bowed head and clasped hands. Presently, large tears ran down her cheeks and dropped on her lap, but she never moved; she did not wish him to know that she was weeping, he would only despise her for it. But he was conscious of every tear she shed. He silently watched the glittering drops as they fell over the fair, round cheeks; then he bent and whispered:

"If it should come to that, if I am to live here no longer, MAGDALEN, will you let me leave Tramley as poor as when I came?"

She started, but neither answered nor looked up. At length he spoke again.

"I have never loved a woman before; you are my first love, MAGDALEN, my pupil. Will you be my wife?"

She looked up. "What am I that you should ask me this?" she cried. "I am nothing but a poor, ignorant girl. *Your* wife must not be such a one as I.

He stooped closer; "MAGDALEN," he whispered, "Look at me!" The passionate tenderness of his deep voice drew her face up like a call. What need was there for words? He took her in his arms, and held her to his heart.

For three months they were infinitely happy. They told no one of their engagement, and no one suspected it. During these months everything went well at the school. MAGDALEN'S power over Mr. LANGLEY was very great; one word, one look, or one touch from her hand would subdue him in his angriest mood. But she could not be always by his side, and one day the peace came suddenly to an end. HUGH quarreled with the rector. The rector was in the wrong, and HUGH, forgetting the deference due to one in the rector's position, stood up before him as an equal, and the end of it was, that when the school-house was closed in the afternoon, the key went into the rector's pocket.

MAGDALEN did not reproach HUGH, although she knew that they must part. They met that evening for the last time at the foot of a cliff beside the sea, which had witnessed many a meeting of their's before this.

"It must have come to th's sooner or later," said HUGH, as they stood hand in hand, with the great mass of water stretching away at their feet. "Do not grieve for it, my darling," he went on; "I was wasting time here; now that you have made a better man of me, I am worthy of better things. And going now will bring me back to you the sooner."

She looked up wistfully in his face.

"The future is all so dark!" she cried. "I feel as though I were holding the last link of a golden chain; and to-night, it will have fallen from me."

"No, it will *not* have fallen," he answered. "Your hand grasping one end, mine holding fast the other, it will remain stretched out between us, until I come back. I will work for you, struggle for you, and rise for you. And *you* must wait for me, for no power save that of God shall keep me from coming back!"

"I will wait," she answered; "I will wait years and years. If I die before we meet again on earth, I will wait until we meet in heaven!" Thus were their farewells spoken.

MAGDALEN kept her secret for two years, hearing from her lover at long intervals, and living on in silent trust in his truth and faithfulness.

After these two years were ended, one bright summer afternoon, Mrs. MARSDEN stood at her cottage door, shading her eyes from the sun, as she looked eagerly towards the school-house, whence the children were swarming, and whence presently MAGDALEN came, with a slow step, but a glad light in her sweet eyes, which had long been absent from them.

"Dear me, what a time that school does keep you!" said her mother, in a vexed tone, as she drew near. "Such a state as I have been in all day! My poor head's just worn out with thinking. MAGGIE, what do you think the postman brought me this morning?"

The girl's face flushed. "What was it, mother?" she asked eagerly.

"Oh, you'll never guess. He brought a letter from your Uncle JACK, in America, who might have been dead and buried, for anything I've known these ten years; and he has sent us money to go out to him,—every one of us,—and he'll keep us, as long as we live. Just think of that! Why, MAGDALEN! GOD bless us! Are you going to faint?"

"Mother, come in and shut the door," said the girl in a faint voice as, white and trembling, she followed her mother into the kitchen. Here she grasped the old woman's hands, and said, in a hurried, constrained voice, "Mother, don't be angry; I cannot go with you—I cannot leave England. Please don't look at me like that. I have had news too, to-day. O mother!" and she broke down suddenly, and clasped her mother's hands to her breast. "Speak kindly to me, dear mother. I am going to be HUGH LANGLEY'S wife!"

Mrs. MARSDEN dropped her daughter's hands, and took her by the arms. "You are going to be what?" she cried.

"I am going to be his wife," she answered triumphantly. "I promised him, long before he went away. And he has written to me now, to tell me that he is able to marry, and he is coming for me!" she cried, the light of a great gladness flashing up into her face. It was the last flash of joy that irradiated the fair face for many a day to come.

MAGDALEN had told her cherished secret, and a storm of reproaches followed—reproaches and a flood of tears so violent, as to exhaust Mrs. MARSDEN'S small stock of strength, and force her to take to her bed, where she sobbed and moaned all night, making herself so ill that when morning came her daughter could not leave her to attend to her duties at the school.

For two whole days this went on and MAGDALEN bore it all in silence, bore the wailings and passionate entreaties not to go away from her, to stay with her poor mother, to whom she owed more duty than to a strange man. The girl's heart died within her. What should she do? Oh that God would show her where her duty lay! For two days the struggle went on, and no light came. She looked at her mother on the evening of the second day, as she lay with closed eyes and lips, utterly spent and worn out with fretting, and felt that she must give HUGH up. Give him up? her love, her life. But she dared not leave that poor sickly invalid, who needed all her care. Her duty was clear.

She bent over her mother as she made the resolve, and whispered a broken-hearted promise, that she would go to America. Her reward came in the answer:

"Could you not have said as much in the beginning? Instead of doing your best to kill me. But it's always the way, you never think of any one but yourself!"

The promise was given, and by the end of the week all was in readiness for departure. HUGH'S letter, announcing his arrival, had lain on her heart, unanswered all that dreadful week, and on their last night in England she sat down alone, to answer it, as best she might.

"Do you remember," she wrote, "What I told you on that evening when we parted, that I felt as if I held the last link of a chain? And now it has fallen from me!"

She told him how she was forced by the duty she owed to her mother to give him up, and begged his forgiveness.

"What am I to do?" she broke out wildly at the end.

"How can I live all my life without you? If I could only have seen you once before I go, I could bear it better. But to part thus! Oh, HUGH, write to me, and forgive me, or my heart will break!"

To this appeal she received a hard and cruel answer.

"I trusted all my happiness to you, and you have wrecked it," he said. "From your solemn promise to wait, until I should come and claim you, no power on earth had right to set you free. You have broken these promises of your own weak choice. If you had been faithful I would have loved you, as never man on earth will love you. I worked for you, have thought of nothing else since we parted, and you have chosen your lot apart from mine. And I——"

The letter broke off here, there was nothing added but the bitter cry "MAGDALEN, MAGDALEN."

A summer day, in southern latitudes. In a pleasant room with windows opening on a terrace and commanding a view of a pretty garden sloping to the sea sat a lady reading. Presently she dropped her book and turning her head slightly, remarked to a younger lady, who was seated at a table in a distant part of the room.

"I forgot to tell you Miss MARSDEN that my sister, Mrs. ROSS, expects some company this evening, and wishes my daughters and yourself to be there; you will like it I think as there are some foreigners to be present. Please be ready at eight o'clock as Mrs. Ross wishes us to be early."

Miss MARSDEN bowed in acquiescence of the proposed visit, and went on with the writing on which she was engaged.

MAGDALEN is changed, but her face has gained rather than lost in beauty during the nine years which have passed since we last saw her. The rounded comeliness of former days has gone, but her dark eyes have a deep, tender look in them, and intellect sits enthroned on the broad, white brow. She has wrought her way out of the great anguish of her youth. The love that caused that bitter suffering has been the leading star, the refining element of her life. She has striven to be what HUGH would have had her be, and has succeeded. No fairer, more intelligent, or more elegant woman, in manners and appearance, will enter Mrs. Ross' luxurious parlors to-night than Miss MARSDEN, the governess of Mrs. TRACY, whose husband is a rich, retired, Southern merchant.

MAGDALEN is alone in the world now. The uncle who brought her over is dead. The sickly mother is dead too, and her daughter had her reward for her self-sacrifice in being with her in her last moments, and receiving a blessing for her goodness. Her brother TOM is seeking his fortune in California.

At eight o'clock MAGDALEN and her two pupils, impetuous Southern girls devoted to their English governess, took their places in Mrs. Ross' parlor. They sat at a side table strewn with books, and MAGDALEN whiled away the time in looking them over, for but few guests had yet arrived.

At length the room filled, and a small sofa near her was taken possession of by Mrs. TRACY and a gentleman who seemed a stranger.

"By the way," said the lady, in the midst of their talk, "where is Mr. LANGLEY? And who is he? A foreigner, of course?"

"LANGLEY? He is in the other room, I believe. He is quite distinguished in political circles in England. At present, he is Secretary of Legation at Washington."

MAGDALEN started. "It cannot be HUGH," she thought: "there are other LANGLEYS in the world beside him." And she bent again over her books.

"How beautiful your open sea is here!" said a voice behind her. "It reminds me of a place where I once lived by the sea, a little village in the south of England."

She did not move; but she knew the voice, those deep rich tones which had so often breathed the story of love into her ear.

At this moment a hand was laid kindly on her arm. "Come with me," said her hostess; "you look very pale; this is too hot for you. Come out with me, and let us take a walk upon the terrace."

Away she went as in a dream, from the only presence the world held for her, out on the dimly-lighted terrace. But she could not walk—she could scarcely stand. "Let me sit down," she cried, as she leant against a pillar near her; "let

me sit down, Mrs. Ross, here, where there is no light." She seemed almost beside herself.

"My dear, there is no seat; just wait a moment," and the lady hurried into the house. She returned in a few moments, but not alone. Another hand brought the chair she had gone to seek, and another hand set it down by MAGDALEN'S side.

"Thanks, Mr. LANGLEY. Now, my dear, sit down; the fresh air will revive you."

She sat down helplessly, without uttering a word.

Mr. LANGLEY did not return to the house, but deliberately took his place against the pillar where MAGDALEN had leaned.

The light from the windows fell on his dark face, as he stood, and MAGDALEN saw him clearly, but he gave no sign of recognition. "We shall never teach this Northern snowdrop to bear our Southern warmth" said Mrs. Ross. "Are all Englishwomen so hard to accustom to new climates?"

He turned and looked at MAGDALEN in the dim light, but no change of expression followed the look. "English snowdrops can stand a good deal sometimes," was his answer.

"You are not at all like a snowdrop, Mr. LANGLEY, although you are a country man of Miss MARSDEN'S," continued the lady.

"I am scarcely English, my mother was an Italian," he answered with a perceptible tremor in his voice, as he thought of the beautiful Southern face which had watched over his cradle."

"Was she? I did not know that. Have you lived in Italy? Tell me about it all, especially Rome and Venice. I long to go there?"

He obeyed her, and talked as MAGDALEN had never heard him talk of the far-famed cities of sunny Italy. It all seemed so unreal, so dream-like. The southern summer nights, the softened lights, and yet in the midst of it stood the center star of MAGDALEN'S life. And how changed! As the deep voice talked on, enriching every subject that it touched upon, she saw how the dark face was softened, refined, yet with its old expression of strength and determination.

"And now, after all your wanderings, you have come here," said Mrs. Ross.

"Yes, I have at last come here but not to stay"

"You do not leave at once I hope."

"I may leave to-morrow." MAGDALEN raised her head at the words, and met his dark eyes fixed upon her with no stranger's gaze.

"Why, Mr. LANGLEY, you will have seen nothing." Mrs. Ross went on.

"I shall have seen what I came to see," he replied.

"Oh, well, of course, you know best about that and — here is Mrs. TRACY, singing," as a sound of music came through the open windows. "Mr. LANGLEY you must come and hear her, and Miss MARSDEN?"

But MAGDALEN chose to sit still, and watched the two figures, as they went together towards the door. At length one of them returned and stood before her in silence.

"I have come along way," he said at length "to ask your forgiveness for certain harsh words of mine written long ago. It will cost you little to grant it, I know," he went on in a slow cold voice: "When the pain of a wrong has ceased we can forgive the wrong doer easily."

She sprang from her seat, and stood one moment shivering, then all her love rose in wild defense, and out of her long silence, leapt this cry: "It has not ceased—O, HUGH, the pain is here still!" And she pressed her trembling hands over her wildly beating heart, and then hid her face in them with one low piteous sob.

"MAGDALEN," whispered a deep voice in her ear, and a strong arm held her in passionate embrace. "Ah, MAGDELAN mia, forgive me, I have been faithful through all, and I come to claim my reward."

She lifted up her face and saw in the dim light his dark eyes fixed upon her with the old tender gaze, yet full of new adoration, as he saw in her a new and a more perfect loveliness than had been hers of yore.

"HUGH, I have waited for you," she answered softly, then between them there was perfect silence, as they stood heart to heart, with the great sea stretching away at their feet, as it had done years before in their quiet English home.

REPARTEE.

IT was said by the London Times that the best repartee on record was one made by a homeopathic physician. It was elicited in this way: A homeopathic physician, practicing in London, published a pamphlet commending the theory and practice of HAHNEMAN. An allopathic physician published an answer. The wordy controversy through the press became warm and personal, and it so happened that the disputants met on the street, and then, from words, soon came to blows. The homeopathist, being the weaker man of the two, was thrown to the pavement, and while down the allopathist stepped over him, and uplifting his cane said to the prostrate homeopathist, "now beg for your life!" No, said the threatened, "not until I am your patient." The anger, and the uplifted club, had no terrors compared with his medicine.

Highly commended as this repartee is by the "Thunderer" we think that SYDNEY SMITH made one fully its equal. SYDNEY had been holding an argument with a county squire, and quite to be expected, soon got the best of it, when the squire, having lost the argument became personal, as most men do in such cases, and then said "Mr. SMITH, if I had an idiotic son, half witted, I would make a clergyman of him." SYDNEY replied, "You may think so, but you father did not."

CONDUCTED BY MISS FAITH RIPLEY.

DECKING THE CROSS.

IN Naples, on a Christmas morn,
A priest the cross was dressing
With opening buds and flowers new-born,
When, all her sins confessing,
A beggar girl drew softly near,
And on the cross she dropped a tear,

"Ah!" said the priest, "my flowers are sweet,
But, child, thine eyes have given
This blessed cross an offering meet
To the dear King of heaven;
For I can place no garland here
So sweet as thy repentant tear!"

straight stitch at the edge of four threads each way), with ingrain cotton of two colors. It is suitable for marking table and house linen.

FIG. 2 is Alphabet in cross stitch for marking napery of all kinds.

GRANDMOTHER SPEAKS.—No. 1.

WELL, well! there is no reason that I know of, why I should not speak occasionally. Old ladies have a good deal of time to think; they are not occupied with the pomps and vanities of the world; they have lived long enough to see the folly of a great many things, and if young people would only be advised, they might save themselves a great deal of sorrow and pain; but no, they are bound to rush along, and see the folly for themselves, and then they are convinced. Experience is a good school and a rough one too; but lessons learned there are apt to be remembered. I have made up my mind, that young people are not as happy now-a-days as they were fifty years ago. They have so much puffing and frizzing, and flouncing and furbelowing to attend to that they do not get time to enjoy themselves as thoroughly as girls used to.

When they go anywhere, it takes such an everlasting time to get ready, that they are quite exhausted before the operation of dressing is completed, and are tired enough to go to bed and rest. It is a great wonder to me what they are about; two hours, at the best calculation, to dress for a party! I expect before they get through life, they will be glad to have a little of the time they squander away in fixing themselves for a fashion figure.

Folks do not look, act, or talk as they used to do. I suppose people are made up very much as they used to be; but somehow, the world or the folks in it have got badly twisted. Even babies don't look as they did. Little darlings! how I pity them! Laid away in their cribs, with a glass bottle substituted for their mother, and fed according to fashionable rules, instead of being snuggled in their mothers' bosoms, as GOD meant they should be. No wonder so many of them die or grow to a maturity of weakness and ill health. It ain't according to nature, to bring babies up in such a way, and it is a sin to do it. But fashion has got ahead of nature and humanity both. Mothers used to take comfort, cuddling their babies in their arms, and were real happy with them; but it is so different now. I suppose it is all in the march of progress. Then, too, we used to have sweet little girls and boys, full of life and fun, and mischief too; but that class of human nature is out of fashion now. There is no such thing as girlhood or boyhood in these days. They are ladies and gentlemen, and they are as full of affectation as the older folks. They make smart speeches and do remarkably pert things; and if they should act as children used to behave, they would get lectured for their outlandishness. No, I don't believe in bringing up children in the present style. I don't think they are as happy, or as good either, as they used to be. They are trained up to be deceitful and hypocritical. The first lessons they are taught, are to put on a smooth exterior and appear better than they are. I presume many will disagree with what I have said. I expect they will; and if they think I am mistaken, they should say so. But I really believe what I have said is too sadly true.

"THE COMBAT DEEPENS."

I HOPE I am duly grateful for the interest which at least two of the superior sex manifest in regard to my unpretending articles. True, that interest appears to assume rather a pugnacious character—still, when we recollect that any mention of the much-ridiculed question of "womans' rights," almost invariably awakens in the masculine breast a feeling akin to that which is aroused in the males of some other species, by displaying before them a scarlet cloth—we cannot wonder at it, I will quote from Sword Stick's article of Dec. 22d, "I charge the woman of to-day with a love of ease and display, and a desire to shirk the responsibilities of her sex, which cannot fail to destroy the sacredness of her position, and the power to mold men." Now, oh, valorous Sword Stick, had you said that such women might occasionally be found, especially in fashionable society, I should have been compelled to agree with you, more's the pity—but as you include the whole sex in your charge, I must say that I consider it either a great mistake on your part, or worse still—the outward expression of that contempt for women in any capacity, except that of a *child's nurse, housekeeper*, or *toy*, which is so prevalent among gentlemen, especially *very young* gentlemen, with unformed minds—whose knowledge of the sex is limited to their mediocre female relatives, and to a few shallow school girls. You are pleased to assert that mothers sacrifice their offsprings to fashion, and money. This is true only of the women belonging to what are termed the "upper classes," and probably of a comparatively small proportion even of them.

With nine-tenths of woman-kind their own personal ease and comfort are the last thing considered, and, when the welfare of their families seems in a measure to require it, they cheerfully make sacrifices, which, were they demanded of husbands and fathers, would be groaned over, and considered unendurable. Of course, there are exceptions to this rule as to every other. When, in rare instances, we see a woman indifferent to the moral and physical well-being of her family, we are likely to look upon her as a sort of monster, whereas nobody is surprised to see a husband and father deliberately deny his wife and children the comforts and luxuries to which they have a right equal to his own, in order that he may indulge himself in what he doubtless considers necessities, but which, instead of benefiting him in any way, only have the effect of making him every day a little more of a brute.

I know men (men, too, who occupy a good position in society, and in the Church and who consider themselves irreproachable as husbands and fathers) who, day after day can, evidently without self-reproach, see a delicate, sickly wife wearing herself out in performing unaided duties which only a strong, robust person should think of attempting. They accept this sacrifice of strength and life as their right, in their supreme selfishness, never, perhaps, stopping to think that the sum which they squander weekly in that vegetable abomination, tobacco, would be sufficient to hire a little help occasionally to lighten the burdens, and prolong the life of her whom they have sworn to cherish and protect. You say "there be many, in whose presence men may well uncover the head, and bow, in loving and reverent homage;" very true—but, the women who inspire that respect are *not* the soft, pliant, submissive nonentities, who sit in "the quiet corner," discoursing on household matters. Now, while pitying those insignificant corner

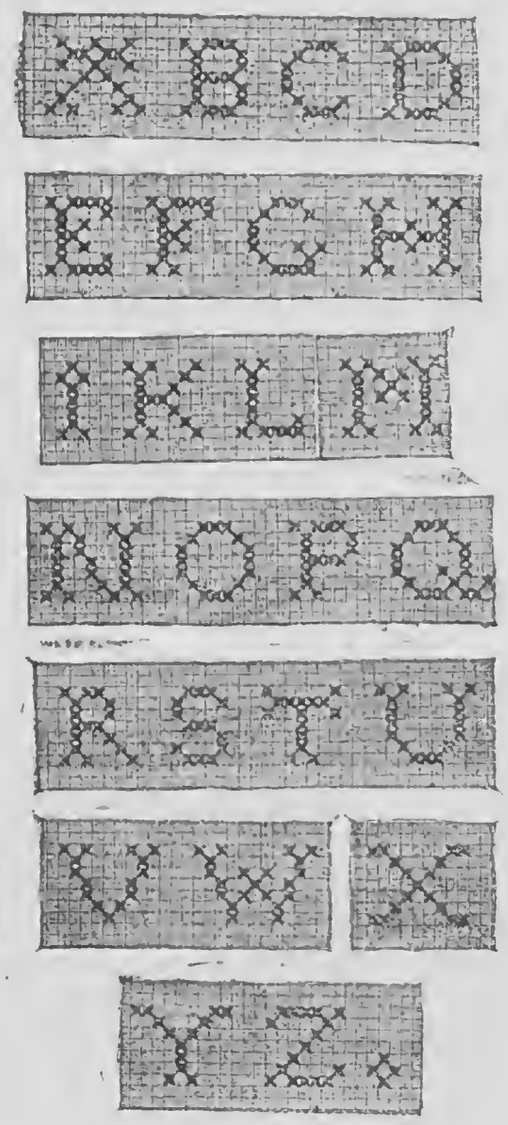

FIG. 2.

divinities, and admitting that their mental and physical weakness and littleness are owing to generations of systematic training and pruning, to make them fit nicely into that snug niche, which is recognized as woman's legitimate place, I would say that not in them lies the hope for better things for our sex.

A class of women is arising in our land, to whom, in the future, men will, indeed, "gladly uncover their heads," for they will have proved, not only to their own joy, but to the perfect, though, perhaps unacknowledged satisfaction of their would-be oppressors, that they are intellectually, morally and physically qualified to stand side by side with their brothers, working with head, heart and *voice*, for the good of the nation. *Onward*, is the watchword! One university after another opens its doors to the noble girls who are no longer content to call their education "finished," at a stage where their brothers' is just commenced. Most of the professions are admitting into their ranks women who will be to them an ornament and a crown. Of *such* material is the mother of the future. *Her* sons will not call her "the old woman," and listen to her words with an insolent smile and undisguised contempt for her opinions.

A better day is at hand—yes, even now, in the East, we can see the first faint streaks which tell of its coming! Ah, brave, but mistaken foe! Cannot you see how vain are all those fightings against what is inevitable? You may strive to block the way of reform—you, and others of your ilk, may play your little games of literary battledore and shuttlecock—but, you can no more stay the tide of progress than a boy could drown the thunders of Niagara with a penny whistle. And so, with armor unpierced, though battered, and soul undismayed, back to her "quiet corner" goes

ERMENGARDE.

TALKS ON TIMELY TOPICS.

The Household Library.

ROSE GERANIUM.

PRAY do not pass judgement against us and rise up in rebellion when we declare that the book-shelves of the average farmer are the most neglected spots in his dominion! Of course, there are very many exceptions, and yours, dear sir, may be one. However, by way of sobering your deliberations you might just get a pencil and paper and briefly catalogue! Facts are stubborn things and we will rejoice with you if they place you beyond the reproach of this accusing pen! We do love beauty as a child loves a butterfly. We joy, in all bright and graceful things, and we hold they are, each in its place, ministers of inspiration.

We like to watch a pair of hopeful young home builders, busy as May-robins, lighting up their pretty domicile with bits of color; tempering it with shade, hallowing every whit by the impresses of loving self-sacrince and dear, careful fingers! We are glad when the marble-topped center-table arrives; when the Brussels carpet, and velvet rug are laid down. We rejoice over the rep-cushioned chairs and the silver tea-service. But withal, there is a sore spot in our hearts unless we can perceive that the library is filling up!

We want to see a new book sandwiched between every two purchases, and newspapers and magazines drifting around so thickly that the very order of the sitting-room is imperiled. We never knew anything worse than intelligent sons and daughters to grow out of such untidiness.

However, there has never been a time calling for such careful discrimination on the part of purchasers as the present. There is no such thing as a simply innocent publication. Literature is either helpful or hurtful.

To avoid the uncompromisingly evil and vicious, is an easy task. When the enemy defiantly hoists his flag, there is no mistaking him. We can, in this case, pass by on the other side; and if we are even wanting, as many must be, in intelligent judgment, our literature of to-day has so many gifted friends and generous advisers, that we need not go far astray.

To go to housekeeping without a family Bible and an Unabridged Dictionary ought to be elected a criminal offense. Here are the beginnings of wisdom and intelligence, and even in the event of all prosperity running backwards, the ill-fated victims need not be left without a tangible basis for respectable knowledge. Indeed, with only these two volumes for text-books, one may be quite fairly equipped for a battle with existence. Yet we only offer this as consolation for the poor and not as an apology for the rich. We should add modern history to ancient, poetry to science, SCOTT and DICKENS to theology. We should know the opinions of the best minds of to-day, upon all questions of social life, of philosophy, of agriculture.

We have known famous business men, keen financiers, to grow out of bookless homes, but never the great-hearted and tender souled. *They* come from retreats where, if poverty precludes more, there may, at least, be found a well-worn Bible! And they come with yearnings for knowledge which will not be silenced until they are fed.

Parents, take a half-hour and glance over your libraries to see if there be not some vacancy to fill up with a volume which will add to the cheer of the windy winter nights. Get for the boy a book of history or travels; for the girl a copy of TENNYSON, or LONGFELLOW, or BROWNING—some sweet poet who sings along the quiet vales of life in notes we all can understand! Win them to read aloud around the evening lamp, and most unconsciously their young souls will be drawn out to follow after those who call—to follow, and sing, and be glad!

For such is the power of influence. Your child will be molded by the companions you select. As you value its happiness and the honor of your name, see that they are noble!

The Querist.

ANSWERS TO CORRESPONDENTS.

A Gurner.—I wish to ask a few questions through your valuable paper: (1) I want to lay about a mile of water-pipe—what is the best and cheapest pipe to lay, and where can it be obtained. (2) How much fall is necessary in order to have the pipe clear itself of any dirt or sand that might get into it. (3) Have you a commission house for selling butter, cheese and farmers' produce in general, connected with your business. If not, please refer us to some good responsible company in New York City, and oblige a subscriber.

Ans.—To obtain a satisfactory answer to a question it is absolutely necessary to be particular in shaping the inquiry. Here neither the object of the work, the size of the pipe, nor the lay of the ground is mentioned, nor is it stated whether the drain or pipe is to be laid in a continuous line—all important considerations in giving beneficial advice. Tiles are, on the whole, the most serviceable for draining purposes, as well as for conveying water for long distances under ordinary circumstances. Of these, experience has shown that the best is the most economical, and that the best hetherto invented is the pipe or round tile and collar. Round tiles of all sizes for drainage purposes should not be laid without collars, as these hold them perfectly in place, prevent the settling in of dirt in laying, and give twice the space for the intrance of water at the joints. They are from twelve to fourteen inches long with an interior diameter of from one to eight inches, and a thickness of wall of from one-quarter of an inch to more than an inch. After allowing for breakage, it will take about sixteen tiles and sixteen collars to lay a rod in length of drain, the cost of which will depend in a great measure on the nearness of a tile-kiln and the expense of transportation. Ordinarily they should not cost, delivered, more than eight dollars per thousand for 1¼ inch tiles, and four dollars per thousand for the collars, making a total of twelve dollars, equal to nineteen cents per rod. The laying of the tiles should not cost more than two cents per rod, based on a skilled man laying 100 rods daily, and receiving two dollars per day.

(2) Whenever practicable, without too great a cost, it is desirable to have a fall of one foot in one hundred feet, though six inches the same length will be quite sufficient, if the work is carefully executed. The least rate of fall which it is prudent to give to a drain, is three inches in 100 feet, and to make this effective requires very careful work. The danger that, unless properly laid and made, drains may become obstructed by silt—earth washed in with the water of the soil—by vermin or by roots is great, and the expense of removing the obstructions, by taking up, clearing out, and relaying the tiles, is often nearly as heavy as the original cost. The best precaution against such a misfortune is that the fall, along the whole length of the drain, should be at a uniform rate, lest the diminished velocity at any part should cause a disposition of silt to choke up the tile, an effect likewise produced by a single badly laid tile or imperfect joint. In *increasing* the fall, curves in the pipe are always advisable, but whenever it is absolutely necessary to *decrease* it, so as to continue the drain with the least possible fall over level ground, the change should be made by an angle. By making an absolute angle at the point of depression, the silt can be caught there in a chamber—in size, proportionate to the quantity of water flowing through the pipe—and removed as occasion may require. We are not acquainted with any dealers in drain pipe in your vicinity, and it is a matter of importance that the pipe should be purchased as near as possible to the place where it is used, as considerable saving of freight can in this way be effected. You can readily ascertain who are the manufacturers nearest to you by inquiries in the next town.

(3) We have no other business besides than that of publishing the Rural. In connection with this, we used to publish works on agriculture and kindred subjects, but this branch of the business has for some years been abandoned, as we found it advisable to devote our entire attention to the production of a first-class family paper. Walter Carr & Co., Pearl street, N. Y., are a reliable Commission House, for the sale of butter &c.

I. A. Young.—In the Rural of January 5th was an inquiry under the above signature, about a cheap and substantial fence which can be removed every fall and replaced every spring, on bottom land subject to overflow. I have found a fence of the following kind useful in a similar situation, and also in other places where a portable fence has been needed. Take four or five boards, 1 by 6 inches, and from 12 to 16 feet long, then two pieces 1 by 4, five feet long; nail together within six inches of the end, just as if making a gate; then take another piece 1 by 3 inches and so long that if nailed even at the top it will come down 12 inches below the bottom board; sharpen its lower end with an axe and sink it into the ground to strengthen the middle of the boards. Then take a length of pine, or other convenient timber, five or six inches in diameter, lay it on the ground and make a notch two inches wide, in the middle; slip the end of each pannel into notches of this kind, and fasten together with a nail. Then take two pieces 1 by 1½ or 2 inches and five feet long, and nail the upper ends of these, one at each side, to the piece 1 by 4, at the top, just under the top board, then nail the other end to the post lying on the ground for a brace. A very strong and convenient fence of any required length can be made in sections of this kind. Here wood is cheap and plentiful; and, of course, modifications must be made in accordance with local conditions in other places, but the principle is excellent. When required to be moved, the sections can be loaded in a wagon and hauled anywhere.

Mich. W. B.

M. V. B. S.—Which is the cheapest, all things considered, for farm purposes, wind-mill, caloric or steam engine.

Ans.—The question of M. V. B. S. cannot be satisfactorily answered as he puts it. There are some uses to which a steam engine can alone be put, while on the other hand it can perform the work of all other farm motors as commonly understood. Caloric engines we consider of no account—noisy, pounding affairs that give no power in proportion to their bulk. If the farm is conveniently situated for the use of a wind-mill you have one of the cheapest and best powers devised for farmers' use. They have been brought to such a state of perfection by recent improvements and attachments, that they will pump, grind, and do almost all ordinary work very satisfactorily at the minimum of expense and risk. We would suggest that "Inquirer" look into the subject carefully before deciding. Data which he has at hand will enable him to judge more correctly than we can advise.

Mrs. G. H. A., New Haven, Conn.—Returns her grateful thanks for the seeds sent, and feels a little puzzled how to treat the little Dioscoreas (1) Should they be kept like seeds, or put in the cellar, or placed in some dry earth till spring? (2) Will you please tell me which is best for hard wooded plants, a light or dark cellar. Also for Geraniums and the like. Please answer in notices to correspondents.

Ans.—(1) The bulblets of Dioscorea very soon shrivel unless kept in sand. If you can, it would be best to plant them now. (2) If it is desired to keep them dormant, a dark cellar is to be preferred, withholding all moisture.

Mendham, N. J.—Please inform me through the Rural which is better for an eight-year old pear orchard that has always been cultivated with garden truck, to continue doing so or put it down to grass. S.

Ans.—We should prefer to continue the garden truck.

News of the Week.

CONDENSED NEW YORK TELEGRAMS.

Tuesday, January 8.—From present appearances, there seems a strong likelihood that the Electoral Count will be investigated either by the Senate or the House, malcontents of both parties uniting in the support of the measure. Some of the Mexican newspapers—they have such evidences of civilization *even in Mexico*—are bragging of the ease with which the "greasers" could put Uncle Sam to rout. The report just made by the Board of Inquiry into Indian Affairs, is a record of fraud, inefficiency and favoritism.

The left lung and pleura of Victor Emmanuel are affected, in addition to his having malarial fever. Same symptoms as in 1872. Accounts of his condition conflicting; "no danger" some say; "great danger," others. Russia insists that her sacrifices and successes have given her the right to deal directly with her enemy, though she magnanimously concedes to others the privilege of being pleased or displeased with the terms she may exact. On the capture of Sofia, the Russians found therein 8,000 wounded Turks.

Wednesday, January 9.—The New York Legislature has re-assembled after holiday recess. The liquor dealers are pressing for the passage of an excise bill favorable to their interest, and Tweed's counsel is trying hard to secure the release of the old reprobate from prison. Good news! That foul, dishonest Department—the Indian service is about to be purified by the dismissal of a number of corrupt officials. Capt. Eads having complied with the requirements of his contract, in making a channel 22 feet deep and 200 feet long at the mouth of the Mississippi, is to be paid another installment of $500,000.

The Turks report two severe defeats of the Servians. The Russian forces, despite the intense cold are still advancing, having just occupied Slalitza and Petrichovo. War is a cruelty even to the victors. England has advised the Porte to sue direct for a truce. Victor Emmanuel is still in danger though the pleuritic pain has almost ceased. His sons, Humbert, heir-apparent, Amedeus, ex-King of Spain, and his daughters, the Queen of Portugal and Princess Clotbilde, wife of Prince Napoleon, are hastening to his bed-side. Diaz has opened negotiations with France for a resumption of diplomatic relations suspended since the death of Maximilian.

Thursday January 10.—Congress reassembled yesterday; much anxiety as to attitude of parties towards the President. The plan for making the Government the depository of savings, by issuing small bonds purchasable at the Post-offices is being pressed, in expectation of thereby popularizing the four per cent loan.

Victor Emanuel, first monarch of United Italy since the days of the Cæsars, is dead, having been born on March 14th, 1820. On his death-bed friendly relations were re-established between him and the Pope, and they are reported to have always admired each other personally. Humbert, I, is now king of Italy—a younger counterpart, it is said, of his father. The Turks, acting, on England's advice, appointed Mehemet Ali to arrange an armistice with the Russians. The latter have captured the Trojan Pass in the Balkans. Gourkha has 55,000 men south of that mountain range. Roauf Pasha will probably replace Suliman Pasha in command of the Turkish forces. The Cretans are in arms against the Turks, and England has sent a man-of-war to look after her interests there.

Friday, Jan. 11.—Geo. H. Pendleton has been nominated Senator by the Ohio Democracy, to succeed Stanley Mathews; nomination equal to election. Senator Conkling has secured the passage of a resolution to investigate the cases of Kunkle and Draper restored, as it is claimed, illegally by the President to their former ranks in the army and navy respectively, from which they were expelled for misconduct—the former under Grant's administration, the latter during the war—considered a move still hostile to the President. Senator Edmunds has introduced an amendment to the Constitution, prohibiting any religious test being required for office in any State, from any one on account of religious belief, and also forbidding all municipal or State aid to any denomination.

The Russians have gained a crowning victory by the capture of all the Turkish forces and material in the Shipka Pass, thus securing a safe passage across the Balkans and isolating the quadrilateral—the Turkish forces in which are besieged by detachments of the Muscovite army. This gives them immense advantage in negotiating terms of armistice or peace. English support is claimed to be impossible, and would be ineffectual if given. Turkey has asked a six weeks' truce, and the Grand Duke Nicholas has referred the matter to St. Petersburg, but still keeps pressing on vigorously. Despite reports of the conclusion of the actual armistice, there is not much hopes of one, at least until further Russian triumphs shall enable them to dictate terms. There is fear that the Russian military party may prove too strong for the diplomats, and continue the war until Constantinople is captured. Suleiman Pasha has been deprived of his command and summoned to Constantinople. Gambetta counsels extreme moderation for the French Republicans until 1880, when McMahon's term of office expires. Gen. Garnier, favorable to the Republic, has replaced Gen. Ducrot, Bonapartist, in command of the Eighth Army Corps. The Government warehouses have been destroyed by fire in Honolulu; loss, $250,000.

Saturday January 12.—Senator Edmunds has written a letter on Civil Service appointments favorable to the views of the President, and there are hopes that he will become the leader of the President's party in the Senate. A Committee of the House has been appointed to investigate all the Governmental Departments. Severe gale and many disasters along the Coast.

Recent Turkish defeats prove pretty conclusively that the Ottoman power of resistance is completely broken down. England appreciates now this unexpected disaster, and the war fever there is red hot. A few days will tell whether Great Britain feels that any force she can send to the support of the Turks can prevent final defeat; distrust of success can alone restrain her in her present alarm. On the capture of Shipka Pass, 28,000 men, 1,000 horses, 12 mortars, 12 seige guns and 80 field-pieces fell into the hands of the Russians. At the Trojan Pass 300 dead Turks were left in the works The Russians have occupied Eski-Sagra and Jeni-Sagra. The Servians have captured Nisch and 8,000 men, 90 cannon and 12,000 rifles. The Montenegrins have taken Antivari and are pressing on towards Scutari. Greece is at fever heat. The Russian military authorities, feeling confident of speedy and complete triumph, are opposed to peace or an armistice. No definite terms for either have been yet agreed upon. Turkey wants a *statu quo*, Russia insists on the surrender of Adrianople, and a strip of northern Roumelia. All agree that severe conditions will be imposed by the victors. Victor Emmanuel's remains will be probably interred in the basilica of Santa Maria Maggiore at Rome, instead of in Milan, with those of his ancestors. His last words were of respect for the Pope, personally, and of his adherence to the Roman Church. The Pope is in excellent health, and surprised that the King, so much younger and stronger, should have been taken before him.

Sunday, Jan. 13.—The strong-minded women have had a glorious time of it the last two days, urging upon the U. S. Senate the passage of an amendment to the Constitution granting female suffrage. The strongest reason for their demands seems to be that they have been unsuccessful elsewhere.

The Turks have burnt the town of Ichtiman, and intend to burn all other towns they are forced to abandon. Hitherto they have never injured the country they abandoned, although military considerations would have led them to lay it waste, especially as it belonged to a hostile population; and Russia in a well-known case set them such an example. Throughout Turkey there is a great panic. Although Adrianople can hardly be defended, civilians have been ordered to quit it, and 10,000 of them are on their way, through the snow, to Constantinople.

Monday, July 14.—The Grand Duke Nicholas is at Gabrova on the point of crossing the Balkans, and has sent word to the Porte that he is willing to see envoys at Kaserlik to discuss armstice conditions, but declines to mention what they may be although insisting that the Ottoman envoys should have full powers to treat. The Porte has appointed two plenipotentiaries to try and arrange a truce on the best obtainable conditions. Germany and Italy have warned England that if her fleet opens the Dardanelles by going to Constantinople, theirs will go also. Accordingly, the only way England can now help Turkey is by actually going to war. A transport with troops from India and another on the way out, have been detained at Malta, and it looks not a little as if Great Britain would take a hand in the conflict, for it can hardly be supposed that she is trying "bluff." The Pope has removed all ecclesiastical difficulties in the way of the burial of Victor Emmanuel in the Pantheon and ordered requiem masses to be celebrated for the deunct monarch.

HOME NEWS PARAGRAPHS.

For the manufacture of Bessemer steel there are now ninety-seven forges, with 317 converters, eleven forgers and two converters in this country. They can produce 3,170,000 tons of steel annually, but only one-half of the amount is needed.

The sixteen starch factories of Aroostook County Me., used, this fall, from 20,000 to 100,000 bushels of potatoes each, the price paid at the factory being from twenty to twenty-five cents a bushel. Many farmers in the county have from 500 to 1,000 bushels stored in their cellars.

The average steer in Texas is worth $9.24. Suppose he can be reared at a nominal cost, it seems he is worth but little when matured. The average steer in Massachusetts is worth $40.81; in New York, $33.15; hence the Eastern farmer can afford to feed and house his cattle.

Nearly the worst managed financial concern thus far is the Miners' Trust Company of Pottsville, Pa. One cent on the dollar is all that is left. But a bank in this city beat this hollow, as the receiver used up all the assets, and, in addition, has presented a bill for services rendered.

The failures for the year in this city were very heavy, in all, 874, with liabilities amounting to nearly $55,000,000 and assets about $21,000,000. Manufacturers, numbering 41, head the list, followed by 35 bankers and brokers who went down under a heavy load of more than $6,000,000.

The record of the Coroners' office, in this city, for the past year, is a dismal one, although, fortunately, not as bad as in 1876. In all 1,166 cases were brought under its supervision as against 1,239 the preceding year. The suicides, 162, were ten more than in 1876, and the deaths from accidents, 552, fourteen more.

The Georgia farmer who has carried off the palm this year is Mr. James H. Booker. He raised sixty bales of cotton, twelve hundred bushels of corn, five hundred of potatoes, a thousand of oats and wheat, and twenty-five hogs. The newspapers chronicle this as the greatest harvest by any one man since the war.

It is estimated by British authorities that one-half their stock of sheep is annually slaughtered for food, numbering at least 16,000,000 animals, averaging fifty-six pounds per head. This gives an annual supply of nearly 1,000,000,000 pounds of mutton through the home supply, in addition to which, 1,000,000 imported animals give about 50,000,000 pounds more.

A three-master, the Ritchie, is now loading at New Orleans, for Boston, which attracts much attention by the beauty of her lines. She is the old revenue cutter Harriet Lane. In 1862 she was captured by the Confederates at Galveston, then became a blockade runner, and finally, being given up by the Spanish authorities in Havana, was sold and converted into a merchant vessel.

Happy tidings for nervous sufferers, and those who have been dosed, drugged and quacked. Pulvermacher's Electric Belts effectually cure premature debility, weakness and decay. Book and Journal, with information worth thousands, mailed free. Address Pulvermacher Galvanic Co. Cincinnati, Ohio.

Dairy Husbandry.

PROCEEDINGS OF AMERICAN DAIRYMENS' CONVENTION.

JANUARY 9, 1878

MR. J. H. REALL of New York offered the following resolution, which was adopted:

Resolved, That a committee of eleven be appointed to organize a National dairy fair, to be held at some central point during the present year; that said committee shall have full power to select place, raise funds, pay premiums and make all arrangements necessary to the largest success of the undertaking; that said committee shall adopt rules for its government and have power to fill vacancies in its own members.

Mr. Frank Moulton said:

Gentlemen and Members of the Association:

I am glad that this matter has been brought up at this stage of the proceedings. I have just been conversing with a merchant from New York City, who has been an attentive listener through all the sessions of this convention. He said that if a dairy convention is held in the city of New York, he will give one hundred dollars toward defraying the expenses. Now I want to say a word in regard to this committee, and its appointment. It commends itself to my reason as well as to my feelings. Coming, as it does, from such a convention as this, it carries no uncertain meaning or emphasis. I am a new hand at these dairy conventions, although I have had something to do with other conventions. But this convention, it seems to me, transcends them all in the spirit which actuates those who govern and present their ideas to it. There is a spirit manifested, and an intellectual power exhibited, that commends itself to our highest admiration. When such men as Mr. Curtis, Professor Arnold, Professor Stewart, and many others (I do not wish to make any invidious distinctions)—when we see such men as these giving their time and talents to the discussions of this convention, certainly more than ordinary importance ought to be attached to the appointment of this committee.

The committees generally appointed by your Dairy Conventions have had a professional and literary significance, on account of the character of the men who have given direction to your conventions; but their business significance has generally not been valued, for no effort commensurate with the importance of the interests represented, have been made to impress the business community. I hold that every effort should be made, now and henceforth, to make upon the business community that impression justly due to the extraordinary commercial values of the ideas enunciated and the practical thoughts suggested.

The idea of circulating only 500 copies of Prof. Arnold's report of the proceedings, considering its value and importance to the country, is preposterous. A very little effort will circulate 5,000, and if proper effort is made in the representation of the business interests involved, 10,000 could be circulated with the greatest advantage. New York is the proper place to hold the American Dairy Fair, to secure for it that continental and world-wide significance that should attach to the industry it represents.

Your committee should not come with distrust to the work before it. Its importance is worthy of the utmost attention which the best merchants of the country can give to it. Your influence should not be like the murmuring brook over a meadow, but flow with the rush of a river, and make an ocean that should wash all the shores of the world. [The above was crowded out of our practical pages.—EDS.]

THE delicate structure of the skin renders it sensitive to the slightest obstructions, whether arising from sunburn, dust or the changing air and wind. **Burnett's Kalliston** is prepared expressly to remove these.

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Jan. 12, 1878.

BEANS AND PEAS.—Receipts of beans past week, 2,000 bbls.; Exports, 875 bbls. Medium continue weak; receipts are liberal and parcels on the truck can be had 5c. below our last outside rates. Marrows toned up slightly early in the week but have dropped back again. Exports moderate. White Kidneys dull; if West Indian trade were active their present price might send some abroad. Red Kidneys quiet. They retail in small quantities and grocers soon supplied. Blank beans largely in overstock; the production of last year was largely above the moderate special call they have, as an ingredient of Turtle soup. Green peas are dull at $1.30@1.35. Canadian peas show light trade; 4,000 bushels exported for the week; quoted 85c. So. B. E. peas scarce and firm at $3.25@3.00.

We quote:—Beans, medium choice, $1.80@1.85; other, $1.60@1.75; marrows, choice, $2.22@2.22½; other, $2.00@2.10; pea, $1.75@2.00. White kidney, choice, $2.00@2.25; other, $2.10@2.25; red, choice, $2.50; extra, $2.50; other, $2.25@2.35. Turtle soup beans, $1.75. Lima, $3.00.

BEESWAX.—Trade is slow, and supplies fair, with prices easy. Sales at 27@23c. for Western and Southern.

Exports past week, 2,277 lbs.

BROOM CORN has a fair inquiry from consumers, and is steady in price.

Green brush at 6@7c.; green hurl, 6@7c.; medium green, 5@6½c.; red-tipped, 4@5c., and common red, 3@3½c.

BUTTER.—Receipts for the week, 15,094 pkgs. The market is taking a natural course. Fancy table stock is scarce enough to hold or sell; in either case, full decided prices are quoted. This sends a good many first-class buyers to look for something "good enough" among the little pet dairies of tubs and tops of long lines. Fine reserved State dairies, that have been reserved for the possibility of strong winter rates, are well supported by the present phase of the market; some extra Delaware have touched 30c., but 28c. is the more general figure, and stock must be faultless at that. Welsh tubs are running in fair to good quality; receipts this season lack the high grades in large packages that are so acceptable to retailers. In shipping half-tubs, avoid the use of other than oak wood for covers. Low grade of State are dull. Western butter is somewhat improved in quality, but trade would be brisker if the grade were still higher. Old Western dull and low. Roll butter is abundant, but the common is neglected, while the best is quoted at 18c. The week's trade has been broken by several days of bad weather.

We quote State fancy pails 28@30c.; other, 25@30c.; creamery, good to choice, 25@33c.; half tubs, selected 27 28c.; extra, 30@31c.; other, 21@25c.; Fall Welsh 26@28c.; Welsh tubs, prime, 27@29c.; other, 12 22c.; full dairies, fine, 26@28c.; common, 18@26c.; firkins 20@26c.; poor State, 12@18c.; Western creamery, good to choice, 26@30c.; poor to good 25@32c.; good, 16@19c.; common, 8@11c.; rolls, 12@18c.; grease, 6½@7c.

Exports past week, 880 pkgs.

CHEESE.—Exports for the week have been 24,278 boxes; this shows some falling off in the export development, but receipts have shown a corresponding decline, and the market is fully as strong as last week. Strictly fancy factories have brought 13 ½c., and the range for fancy is 13@13½c.

Fancy factories, 13 13½c.; good and prime, 12½@12¾c.; fair lots, 11¾@11¾c.; poor, 8@10c.; 7@10c., skimmed. Farm dairy, 11½@12¾c. for good to prime; 10½@11c. for fair lots; 7@10c. for skimmed; Western factory, cheddar, 12¾@13¾c. for fine 10½@12c. for good; 5@8c. for poor.

Receipts for the week, 19,650 boxes.

Liverpool cable, 63s. 6d. Gold closes 102¼.

COTTON has been quite active, and fluctuating sharply.

Latest prices are for January, 11.36@11.37c.; February, 11.45@11.46c.; March, 11.58@11.60c.; April 11.72@11.72c.; May, 11.83@11.85c.; June, 11.98@11.99c.; July, 12.04@12.05; August, 12.10@11.11c.

Quotations for spot cotton are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted.

	Uplands.	*Ala.*	*Orleans.*	*Texas.*
Ordinary	9¾	9¾	9¾	9¾
Strict ordinary	10	10	10¼	10⅛
Good ordinary	10¼	10¼	10¾	10¾
Strict good do	10⅝	10⅝	10¾	10⅝
Low middling	10 15-16	10 15-16	11 1-16	11 1-16
Strict low middling	11 3-16	11 3-16	11 5-16	11 5-16
Middling	11¾	11¾	11¾	11¾
Good middling	11¾	11¾	11¾	11¾
Strict good middling	12	12	12⅛	12⅛
Middling fair	12⅛	12⅛	12⅜	12⅜
Fair	13	13	13⅜	13⅜

Stained.

Good ordinary, 9¾c.; Strict ordinary, 10c.; Low middling, 10¼c.; Middling, 10⅝c.

DRIED FRUITS.—Apples are dull, only the choicest sliced and quarters wanted. Peaches are hard to sell; small fruits generally are scarce. Prices throughout are steady and unchanged.

Apples—State quarters, old, 5¾@6¼c.; new, 6¼@6½c.; Western quarters, old, 6@6½c.; new, 6@6½c.; Southern, new, prime sliced, 7c.; fair to good, 5@5½c. Peaches—Peeled, new, 11@12c.; unpeeled halves, 4¾ 5c.; unpeeled quarters, 4@4½c. Pitted cherries, 16@17c. Blackberries, 9@10c. Raspberries, 27c. Plums, 16c.

EGGS.—Receipts for the week, 4,659 barrels. The dull and uninteresting state of the egg market is still a subject of surprise among receivers. From the light trade it would almost seem that some substitute has been found for eggs as formidable as oleomargerine has been to cheap butter. Only the freshest from any point receive attention and then sellers have to humor buyers in quotations. Limed are never without leading to increased business.

Near points, 22@23c.; State and Pennsylvania, 20@21c.; Canadian 18@19c.; Western, best, 20½c.; other, 17@19c.; Southern, 19@20c.; Limed, State, 16@17c.; Canada, 15@17c.; Western, 14@16c.

FEATHERS.—Live white prime Western geese, 45@47c., mixed, 30@40c.

FEED.—Is in light receipt and higher. Sales of 40 pounds ave. $21.00@22.00; 60 pounds ave. $20@21; 80 pounds ave., $20@21; 100 pounds, $21@22; and rye at 18@20.

FLOUR.—Receipts have been large, export and home demand light, and prices lower and unsettled. Latest prices are $4.35@5.10 for poor to fancy superfine State; $5.10@5.45 for common to fair extra do; $5.45@5.75 for good to choice do.; $4.35@5.10 for superfine Michigan, Indiana, Iowa, &c., outside for choice; $5.10@5.45 for shipping extra do., the inside price for poor, and $5.45@5.75 for good to strictly fancy extra do.; common to choice white wheat extras, $5.75@7.25; fancy do at $7.25@8.25; red and amber winter wheat, good to choice family, at $5.45@7.25; round hoop Ohio at $5.25@5.85, and trade brands of do. at $5.75@7.00, the latter for choice; St. Louis, $5.50@6.25 for poor to fair extra and $6.25@7.50 for good to fancy, (with a few brands of very fancy quality quoted up to $8.25@8.50); Minnesota clear, $5.25@6.25; Minnesota "straight," common to fancy, at $6.00@7.05 and patent poor to very choice, $6.85@9.10, with a few fancy at $9.25@9.75; unsound stock at $2.75@6.50; city mill extra at $6 20@6.60 for fair to very choice for West Indies; do. for England $6.25@6.35; do. trade and family extras, $6.55@7.75; do. South America, $6.50@7.50; No. 2 at $2.75@4.10.

FRESH FRUITS.—Exports apples past week, 2,200 bbls. Our best demand now from exporters, who are paying pretty full prices. Local parcels are firm. Spitzenbergs are out, commercially.

We quote Baldwins, $3.75@4; Greenings, bright, $3.50@3.75; scalded, 2@2.50; Talliman and other prime sweet, $3.25@3.50; Roxbury Russets, $3.75@4; common Russets, $3.00@3.62; prime shipping lots of apples, $3.50@3.75. Cranberries have only a moderate movement, but good stock is firm. Sweet apples will help them later on. Cranberries, bbls., $4@7.00; crate, choice, $2@2.25, good, $1.75; poor, $1@1.50. Grapes dull—but few good enough to bring 6@7c. for Catawba; soft berries, 2@4c. Extra Florida oranges, $5 ₱ case; others, $3@4; sellers advise that choice should be stem-cut and wrapped in papers. Peanuts dull; high prices restrict buying—$1.45@1.65 for Virginia. Hickory nuts, 75c.@$1 bush. Texas pecans, 8@9c.

FURS AND SKINS.—Quotations are only nominal and the present outlook does not indicate an early settlement of values.

	No. 1 quality. Nor. & East.	West & N. W.
Otter, ₱ piece	$3 00@4 00	$2 00@2 50
Gray Fox	40@ 45	40@ 45

Black Bear	5 00@6 00	4 00@5 00
Brown cubs and ylgs.	1 00@2 00	1 00@2 00
Florida deer skins.	15@ 18	
Fisher	5 00@6 00	4 00@5 00
Mink, dark	85@ 90	50@ 60
pale	50@ 60	30@ 40
Muskrat, winter	8@ 10	6@ 8
fall	6@ 7	4@ 5
Kitts	@ 2	@ 2
Beaver, ₱ ℔	1 00@1 25	60@ 75
Raccoon	35@ 45	35@ 45
Opossum	3@ 6	3@ 6
Skunk, black		40@ 45
striped		5@ 20
Wolf, mountain		1 50@2 00
prairie		50@ 60

GRAIN.—All articles have been depressed and lower, on the look of affairs abroad, and but little export demand.

Latest sales are of No. 2 red at $1 37@— ungraded red and amber State, $1 53@1 55; white, $1 56; No 1 Northwest spring, $1 40; No. 3 Chicago, $1 27½; No. 2 red for January at $1 32; No. 2 Milwaukee spring, $1 33. Rye is a trifle steadier; sales of Western at 74@7 c.; State at 75@77c. Barley, 85c for No. 1 Canada; 75@79c. for two-rowed State. Corn is weak and quiet. Latest sales are of New York No. 2 at 53¾@53¾c.; steamer mixed, February, 56@57½c. Oats of New York extra white, at 41½c.; no. No. 1, January, 38c.; No. 2 white, 39½@40c.; mixed Western, 37½@39½c.; white Western, 38½@40c.

HAY AND STRAW.—Receipts have fallen off, and prices harden a little.

Bale hay, 65c. for shipping, and 75@85c. for retail qualities; clover, 40@50c. for prime. Straw, 50@55c. for long rye; 40@45c. for short rye, and 40@45c. for oat.

Exports last week, 1,475 bales.

HIGHWINES are lower—$1.09.

HONEY.—The market is merely nominal.

HOPS.—Exports for the week have been 3,700 bales. This steady good movement to the other side exerts a steady feeling as to prices, but no advance made.

State choice to fancy, 11@13c.; do., low and fair, 5@7c.; Eastern, new, 8@12c.; Wisconsin, do. 5@8c.; Yearlings, 3@5c.; Olds, all growths, 2@3c.; Californians, 12@14c.

LEATHER.—Hemlock sole, 21@22½c. for light, 22@24c. for middle, 22@24c. for heavy, 20@21½c. for good damaged.

OIL-CAKE.—Western is offered at $32.50 ₱ ton.

POULTRY AND GAME.—Live poultry sells almost as well as dressed, but neither has the activity that should attend the date. Tom turkeys are now rejected.

N. J. chickens, 9@10c.; fowls, 10@12c.; Turkeys, N.J., 11@13c.; Ducks, N. J., pair, 60@$1; Geese, N. J., $1.75@1.87; Western, $1.25@1.50.

Dressed poultry took a good start, but the weather has turned provokingly adverse to business. Prices have dropped to discouraging rates, and there is some danger of an overstock. Heavy turkeys are not wanted at all: should be utilized at home, if possible. Ducks are about the strongest item in market, and these are not quoted profitably. Western is turning out badly and is hard to sell. Cold weather at one end of the route and a thaw at the other are bad for perishable produce.

Fancy Phila. and N. J. turkeys, 12@13c.; good, 10@11c.; large or thawed, 10@11c.; chickens, choice, 13c.; good, 11@12c.; common, 7@9c.; ducks, choice, 12@13c.; other, 9@11c.; geese, fancy, 10@11c.; other, 7@9c.

Game is rather plentier, but the mixed quality causes unsettled prices. Prime stuff is ruling high—higher than ordinary demand will warrant. Grouse scarce. Hares and rabbits unusually firm. It is common to see them begging a customer at this part of this season. Venison is closing out at 7@10c. for best saddles.

Hares and rabbits, pair, 49@50c. Black bear, 25c. carcass. Canvas-back ducks, $1.50@2.25; Red-heads, 75c.@$1; Mallard, 65@75c.; Teal, 40@50c.; common, 25@35c. Quail, prime, $2.00@2.25; soft, $1.50@1.75. Partridges, pair, 90c.@$1.00; soft, 70@80c. Grouse, $1.15@1.25.

PROVISIONS.—Hog products have been depressed and lower. Mess pork $12.40@12.50 for spot lots $12.40 for January, $12 50 for February and $12.50 for March. Bacon at 6¾@—c. for long clear and 6¾c. for short clear. Lard—Western steam at 7-67½c. for spot, 7-67½c. for January, 8c. for February, and 8.80c. for March. Tallow, 7¾c. for prime. Steamne, 7¼c. for prime Western. Beef hams at $16.50, Beef—New extra mess, $18@13.50; plain, $11@12.50; new packet, $11.50; family mess, $16@17; extra India mess, $25 25.50 for city brands; do. Philadelphia, $23 50@24.

SALT.—Ashton's at $2.50; Higgins', $2.50 and other sack lots at $1.10@1.15.

SEED.—Grass are lower: clover 8½@8¾c. for prime, timothy, $1.37½@1.40. Rough flax, $1.55.

TOBACCO.—Offerings of desirable lots are small, and export movement is restricted. Prices generally are strong.

KENTUCKY LEAF.

VEGETABLES.—Exports of potatoes past week, 7,500 bbls. The market for potatoes is quiet and prices are quoted to their limit. Few sweets wanted. The exportation of onions has revived and prices are firmer. The advanced season gives a strong and better tone to miscellaneous truck.

We quote Peach Blows, $1.75@2, bulk and double-heads. Early Rose, $1.75@1.87; Peerless, $1 25@1.50; Nova Scotia, $1.50@1.75; Sweet, $1.50@2.50. Cabbages, 100, $2 50@4.50; red, 4@5. Marrow squash, bbl., $1.50@2; Hubbard do., $2.00@2.50. Russia turnips, 75@87c. Carrots, 75@87c. Beets, bbl., 75c.@$1.00. Red and yellow onions, $1.25@1.50; white, $1.25@1.75. Celery, doz., 75c.@$1.

WOOL.—There is a stronger demand for Western fleeces and California stock, and altogether an improved feeling.

Ohio, Pennsylvania and Virginia—XXX and picklock, 47@50c.; XX, 45@47c.; X, 42@45c.; No. 1, 43@46c.; No. 2, 38@40c.; common, 35@37c.; combing, 50@54c.

New York, Michigan, Indiana and Wisconsin—XX, 38@42c.; X, 37@41c.; No. 1, 40@43c.; No. 2, 35@37; common, 34@36c.; combing, 50@54c.

Iowa, Vermont and Illinois—X and XX, 35@38c.; No. 1, 37@42c.; No. 2, 36c.; combing, 48@52c.

LIVE STOCK MARKETS.

NEW YORK, Jan. 14, 1878.

BEEVES.—Receipts for the week, 9,925 head; do last week, 8,005 do. The market has ruled easier, several rainy, bad days for slaughtered stock having lowered the purchasing feeling. At the close 10¾@11c. were incidentally made, but 10¾c. was looked upon as a big price for wholesale quantities. Ordinary to good steers brought 8¾@10¼c. Fat, handsome stock reserved to a considerable extent for export. The droves chiefly from Illinois, with no Cherokee or Texas.

COWS AND CALVES.—Receipts are larger and there is a variety of prices. Strictly prime milkers bring $65@70; others, $20@50 for poor; fair to good, $40@50.

VEAL CALVES.—Prime live veals quoted dull at 6@9c.; the extreme for fine N. J. Grassers are dull and low, 2½@3½c. Hog-dressed calves slow with soft, souring weather; 9@11c.

SHEEP AND LAMBS.—Receipts for the week, 27,163 head; last week, 14,366 do. The market has been dull, receipts very heavy, and there have been losses on prime stock. Common light sheep, 4½c.; prime Canadian, 5¾c.; good Kentucky, 6c.; choice lots, by the car-load, $6.25@6.30 ₱ 100 lbs. Lambs, 7@7½c. for best; fair, 5¾@6¼c.

SWINE.—Receipts for the week, 41,420 head; do. last week, 26,100. The market has been active; none of the heavy supply left unsold. At the close light averages held at $4.75; killers bidding $4.50 ₱ 100. Country-dressed pork, 5@6c. for heavy to light; Western dressed, 6@5½c.

TO ADVERTISERS! We will send free to all applicants who do any newspaper advertising, the THIRD EDITION of **AYER & SON'S MANUAL FOR ADVERTISERS.** 160 8vo. pp. More complete than any which have preceded it. Gives the names, circulation, and advertising rates of several thousand newspapers in the United States and Canada, and contains more information of value to an advertiser than can be found in any other publication. All lists have been carefully revised, and where practicable prices have been reduced. The special offers are numerous and unusually advantageous. Be sure to send for it before spending any money in newspaper advertising. Address N. W. AYER & SON, ADVERTISING AGENTS, Times Building, Philadelphia.

THE "POULTRY WORLD," Hartford, Conn., is a success in its way, beyond precedent. Vol. 7 begins January, 1878. Order this best of poultry monthlies. It is original, fresh and practical, always. $1.25 a year. Only 75 cts. extra gives every subscriber **12 splendid fowl Chromos**, annually! Every poultryman should have this excellent Monthly. Now is the time to subscribe for 1878!

The new **Weekly "American Poultry Yard"** is also just out. $1.50 a year (52 numbers) post-paid. Or, both papers to same address $2 only.

H. H. Stoddard, Hartford, Conn.

KNOW THYSELF A new medical Treatise "THE SCIENCE OF LIFE, OR SELF-PRESERVATION," a book for everybody. Price $1, sent by mail. Fifty original prescriptions, either one of which is worth ten times the price of the book. Gold Medal awarded the author. The Boston Herald says:—"The Science of Life is, beyond all comparison, the most extraordinary work on Physiology ever published." An Illustrated Pamphlet sent FREE. Address DR. W. H. PARKER, No. 4 Bulfinch Street, Boston Mass. **HEAL THYSELF**

It is a mistake to suppose that any department of a paper may be slighted. The most important information is to be found, at times, under the guise of an advertisement; and it is agreeable to the advertiser and a courtesy to the publisher to mention the source of your information—in other words, to mention the paper.

Reading for the Young.

THE VOICES OF THE NIGHT.

I.

I stood on the stoop at midnight,
When the gutter was freezing hard.
And a chorus of howls quite deafening
Came from the near back-yard,

II.

I heard the frightful clamor
From the nearest high woodshed :
Like a chorus of fifty demons,
It pierced into my head.

III.

And far in the sleety distance
Of that cruel winter's night,
The music was re-echoed
From roof-trees clothed in white,

IV.

Along the great high fences
Some wavering shadows lay,
And the screams that came from the darkness
Seemed to rise and bear me away

V.

And at those yells, uplifted
Into the evening air,
A sickly shudder went through me
That made me clutch my hair.

VI.

How often, O how often,
In the nights that had gone by,
Had I listened to that chorus
Until I wished to die.

VII.

How often, O how often !
I had wished as I did just now,
That I had a brickbat handy.
To stop the infernal row.

VIII.

O for a good breech-loader!
O for a bushel of bats !
To lull them to sleep forever—
Those————————cats! [*Puck.*

JOHN GUBBINS' DOG SCHOOL.

When John Gubbins came home from the war, with only one leg and a great big hole through his shoulder, he wondered what work there could be for him to do, with only a part of himself left, and that old and rusty. For many days he looked down-hearted, and hobbled up and down the village street, peering into the shop-doors, and over the fences, where holly-hocks and lilies stood up like gay young soldiers.

John Gubbins had a dog that looked enough like him to be his own son. Towser Gubbins limped on one leg and had one ear half bitten off—the work of a bloodthirsty old pig that thought he was after her young ones, one day. John had taken a great deal of pains in teaching Towser, and he was one of the "most knowledgeable dogs," as Patsy Burke sa'd, that anybody ever knew. Towser could open a door as well as any one. He stood up on his hind legs, held the handle by one fore paw, and struck the latch with the other. Open flew the door, and in walked Towser Gubbins. Then everybody laughed except Towser.

Sitting in his door one dark day in spring, poor John Gubbins felt very low-spirited ; his hat was old, his coat torn, and his stump of a leg bothered him more than ever. He said to himself that he wasn't good for much anyway, and he might as well be a clam and done with it. John had no wife, so he kept house for himself in a little bit of a shell that wasn't much larger than a dry-goods box; and there he did some wonderful cooking, and a kind of washing and ironing that would have amazed any child in Belleville. Just before he sat down in his door he had done up his breakfast work ; that is, he had wiped off his plate with a bit of newspaper, had fed a square inch of mutton-bone to Towser, and had put his army blanket wrong side out and bottom side up on his lumpy straw bed. Therefore, John had nothing more to do, so he sat down by the door and thought.

Close in front of him sat Towser, looking up in his face, and now and then cocking up his ears smartly, as if to hurry John along and make him talk.

"Towser," said John, "you're a pretty fair beast in your way, and we've got to do something to get our bread and mutton; now, suppose we teach a dog school?"

Up jumped Towser, wagged his tail, took a little walk around in a place not larger than a wash-bowl, and sat down in the very same spot. It was plain to be seen that Towser liked the plan.

"The first thing," said John, "is to get our scholars, and the next, to keep you from chawing them up; for there's a bit of bad blood in you, Towser Gubbins."

Up jumped Towser, and putting his forepaws on John's one knee, he ran his tongue out and smacked his lips as if he already tasted a terrier.

"Down!" said John, "and let's go and hunt up our academy."

So out they went, John hobbling along with his one leg and crutch, and Towser running and skipping on three legs as gracefully as he could, for fear the village dogs would laugh and say he made a dreadful "botch" of it. All day long they walked the town, John and Towser Gubbins, and next morning four of the village boys came to John's little house to talk about the new school for dogs.

Tommy Watson had a pink-eyed, soft, white poodle, which wore a blue ribbon around her neck, and drank weak tea with sugar in it. She was washed every day, and always cried when her ears were rubbed.

What this dog could learn John did not know, but he told Tommy that, judging by her looks, she wouldn't be able to open doors and climb ladders like Towser, because she looked too lady-like. However, Pinky Watson joined the class at twenty cents a week.

Next came Harry Nelson's dog—a sober-looking Spitzberger fellow, fond of his ease, and more than fond of ice. He had been known to lie down on a piece in front of the kitchen door, and stay there until the ice melted and the water ran down the path to the garden. However, Spitzy joined the class, too, and was to be brought every morning at nine o'clock precisely.

Then came Neddy Fowler's greyhound, a long-legged, light-brown fellow, with a sharp nose, and a body that was all breast and no stomach. John thought he would be a credit to the academy, so he took Lueth at fifteen cents a week, intending to make a tight-rope performer of him.

Then arrived Walter Lester, leading a long, low-bodied dog, with splay feet and great bulging eyes, whose name was Turk, and who looked as if all he cared for was to eat and to sleep. Old John did not care to undertake Turk, for he was sure he would never learn anything, and would have to be whipped quite frequently. But Walter loved Turk dearly, so John couldn't say "no," and Turk Lester entered the school at twenty cents a week, and the privilege of being whipped for the good of his class. Then the boys all went away and left their dogs in charge of John and Towser Gubbins.

That the scholars might see what a dog had learned, and so not be discouraged, John first showed what Towser could do. The learned dog walked across the floor on two legs, opened the cupboard door and helped himself to a bit of meat; whereupon all the dogs opened and shut their mouths in a hopeful manner, and looked as if they might learn that much very soon. Then Towser jumped through John's arms, back and forth; then he turned round and round on his hind legs, while John whistled a tune; and that, all the dogs knew, was dancing. Then Towser put his forepaws against the wall, and turned his head down and shut his eyes. There he stood like a stone until John shouted "A-men!" and then he leaped up and down, until John gave him a piece of meat, and said he was "the plousest dog which lived."

Just as Mr. Gubbins expected, the poodle did not know anything whatever; and the moment John tried to make her stand on her hind legs, (which almost any dog can do,) she whined, and sniffed, and cried, and drew herself all up into a ball, and finally crept under the cupboard, while Towser, with his waving tail and great big eyes, stood close by, ready to seize her the moment she came out.

John thought he would try the Spitz next; so Spitzy stood up and begged for his dinner, and jumped over a stick very nicely. So far, so good. Then John called Lueth, the greyhound; who, not liking the looks of things, took one long leap over the table, and out of the window, and retired home without delay. John reached to the door, but the scholar was out of sight; so he went back and put a big black mark against the name of Lueth Fowler.

Turk Lester was next called up; but, on being told to stand up, he sat down all in a heap; and so like a great coward, that John got a stick and gave him a hint that school-teaching was strict business, and he had better mind his master. But the moment John struck Turk, he showed his teeth and growled, and when he took him by his forepaws and told him to walk along, "left—right," "left—right," Turk flew at the school-teacher and tore his coat. This was too much for Towser Gubbins. He leaped from his place by the closet, and taking Turk Lester by the neck, he gave him a fearful thrashing.

The Spitz dog barked with fear, and the poodle under the cupboard cried aloud. It was Bedlam at the academy. John with his slippery wooden leg, had the greatest trouble trying to get the dogs apart; and when he did, he saw that Turk's nose was bleeding, and his tail was bent to one side, and he was the worst-looking dog he had ever seen in many a day. The poor fellow crept behind the door, nor would he eat a cold pancake that John had been saving for a week; but there he crouched, crying and trembling for fear of Towser.

It was nearly noon now, and John Gubbins was getting tired. "This won't do," said he; so he took a stick and poked the poodle out from under the cupboard. Out came poor Pinky, squealing and all drawn up in a cowardly bundle, and it so enraged Towser Gubbins to see a dog behave in such a miserable manner, that he at once fell upon poor Pinky and shook her until her tail nearly dropped off. John shouted at Towser, but Towser thought he was cheering him on, and saying "sic 'em—sic 'em;" so the harder he shook, till at last the foam ran out of Towser's mouth, and Pinky's voice was not to be heard. Then John Gubbins got frightened; so he took his crutch and beat Towser until he dropped poor Pinky Watson, who lay like a wilted fluff of wool upon the floor, just as if she were dead. John took her up and bathed her head, and wet her nose, and rubbed her paws, just as he saw some people do when a lady fainted away one day, and, by and by, Pinky "came to." And how sorrowful she did look! John offered her a cup of water and a cold potato, but Pinky only whined as if nothing could do her any good; and so she kept perfectly still, brooding over her troubles. Towser sat close by, looking at poor Pinky as if he wouldn't be that kind of a dog for all the world—so gentle, but so very weak.

When twelve o'clock came at last, John Gubbins let all the dogs go home; but he took Towser by the collar and whipped him soundly, and afterwards he shut him up. * * *

"I've made up my mind," said he to Towser that night, "that nobody can do a money-making business with such a dog as you are; but somehow or other I haven't the heart to kill ye, and nobody will take ye as a gift; so we'll go along just as we were, old boy, a couple of poor old cripples, begging a living from folks that's better off.

And so there wasn't any school for dogs in Belleville after all; and John and Towser Gubbins never got rich, but they lived together and enjoyed life comfortably.—*F. H., in Domestic Monthly.*

OUR CHRISTMAS FESTIVITIES.

Some one proposed we should give an account of the good times we had Christmas and as our's was a "new departure" from the old stereotyped Christmas Tree, I thought I would venture to tell you about it. It was at the church and was for the benefit of the Sabbath-school scholars, but all who chose took part in it. I am not sure though but some would have chosen to take presents that did not get them.

There was a platform erected at one end of the church, and a house, made by nailing a frame-work of boards together, and covering with evergreens, placed on the platform. There was a chimney, and the roof appeared to be covered with snow, which had fallen in flakes at the side. On close inspection this proved to be cotton batting. Some tiny posts were put up around the platform and strings of pop-corn were festooned around them to represent a fence covered with snow. They were supposed to be Santa Claus' premises.

After some very fine singing of appropriate pieces, and the recitation of several essays by the little people, a committee of little girls was appointed to visit Santa Claus. They rapped at the door but received no answer. Rapped again but still no one appeared. They consulted among themselves and concluded to go around the house and see if his reindeers were gone.

Just then a couple of tiny boys, dressed with tall paper hats and grotesque costumes rushed from behind the house and wanted to know what they wanted. The little girls said they wanted to see Santa Claus. The little boys said that Santa Claus had been out all the night before and could not be disturbed. He was asleep. (This was Christmas night.)

Little girls: "The children of Fairfield have not had their presents, and he must come and bring us some." They rap at the door again and after a time Santa Claus sticks his head out of the chimney. They all shouted "Santa Claus!" especially the spectators who were not expecting this.

Santa Claus asked them what they wanted, that they should wake him up when he was so tired.

Little girls: "Why, the children of Fairfield have not had their Christmas presents!"

Santa Claus asked his boy attendants if there were any presents left and they said only a few, so he called to the Fairies to bring him some. Some tiny little girls, dressed as fairies, came from the house bringing presents, and Santa Claus read the names attached to each gift, as larger girls, dressed in white, carried it to the person for whom it was intended.

One thing I had forgotten in its proper place. Santa Claus asked the little girls where the children's stockings were. "Why they are on our feet," was the reply. "Can't you take them off so I can put the presents in them," said he. "Why, we can't go barefoot, please give us the presents in our hands, this time."

We really had a very nice, enjoyable time, and I think the older people enjoyed it as much as the children. We took pains that none of the children were slighted, but each one received some sort of a present. Loretta.

The Puzzler.

ENIGMA.

Village maid and lover meet
By my shady, cool retreat;
I'm what timid people take
When they chance upon a snake;
In a gun, in many a lock,
You may find me in the clock;
Painted, ever young and fair,
Fragrance greets me everywhere;
Of a rat-trat part am I;
In a bed concealed I lie;
With velvet couch or easy chair;
I am deceptive—so beware!

☞ Answer in two weeks. Bell.

Sabbath Reading.

AT THE BAR.

"Who speaks for this man?" From the great white
Throne,
Veiled in its roseate clouds, the voice came forth;
Before it stood a parted soul alone.
And rolling east and west and south and north.
The mighty accents summoned quick and dead:
"Who speaks for this man, ere his doom be said?"

Shivering he listened, for his earthly life
Had passed in dull, unnoted calm away;
He brought no glory to its daily strife.
No wreath of fame, or genius' fiery ray;
Weak, lone, ungifted, quiet and obscure,
Born in the shadow, dying 'mid the poor.

Lo, from the solemn concourse hushed and dim,
The widow's prayer, the orphan's blessing rose.
The struggler told of trouble shared by him,
The lonely, of cheered hours and softened woes;
And like a chorus spoke the crushed and sad,
"He gave us all he could, and what he had."

And little words of loving kindness said,
And tender thoughts, and help in time of need,
Sprang up like leaves by soft spring showers fed,
In some waste corner, sown by chance-flung seed;
In grateful wonder heard the modest soul,
Such trifles gathered to so blest a whole.

O ye, by circumstance's strong fetters bound,
The store so little, and the hand so frail,
Do but the best you can for all around;
Let sympathy be true, nor courage fail;
Winning among your neighbors poor and weak
Some witness at your trial hour to speak.

[*All the Year Round.*

TREELESS JUDEA.

The only trees one meets are the olives, which however, are by no means plentiful in Judea, and mostly old and stunted-looking. In Samaria we saw several considerable plantations of them, but yet that country is also sadly deficient of trees. Where now is the oak tree on which Absalom hung by his bushy locks? There is, I believe, only one remaining sufficiently large for this; and yet we read that the "Wood of Ephraim," where he was defeated, destroyed more men than did the sword. And where is the sycamore tree upon which Zaccheus climbed? I doubt if there be one such within many miles; and yet we know that Jericho was once richly clothed with trees and verdure, and called the "City of Palms." Indeed, that Palestine generally was once extremely fertile, and rich in woods and verdure, is evident from the meaning of many of the Scriptural proper names * * There is along almost every little water-course a number of what are called trees, but they are generally willows or mere copses of brush wood. A tree of any description, of size sufficient to make an ordinary beam for building purposes, is quite a rarity—such are only to be found miles apart. The vine, so much alluded to in the Bible, is somewhat rarely seen; but that it was extensively grown is evident by the traces of terraces upon the steepest hills still abundantly visible. Then, as to the flowers—"The Rose of Sharon" and the "Lily of the Valley" cannot be found. There are many wild flowers certainly, but generally they grow out of a "dry ground," and have, with very good blossoms, almost no green foliage. "Thorns and briers" are abundant, but very little foliage also, and seem useful only for burning. The fig-trees even are few and far between, and the orange, apricot, and almond still more so. The fields are not enclosed, except in some rare cases, where a wise husbandman has gathered the loose stones into piles around his border. Hedges are rare, but when seen they are generally formed of large cacti covered with dust, and having in the twilight a somewhat weird look. Cultivated lands in Judea are very rare, and even in Samaria are much covered with stones, making ploughing with the miserable piece of crooked wood, a very superficial operation. We felt surprised and ashamed oftener than once to see our dragoman (who frequently rode considerably in advance) lead his followers right through a field of growing corn, without the slightest compunction, or any consideration for the husbandman, merely to save a few minutes' time in going to see some object, or reach some desired path. The inhabitants seem so accustomed to submission under any and every Turkish oppression that no complaint or opposition was offered.—*The East, by W. Y. Martin.*

THE HISTORY OF CHURCH PEWS.

In the early days of Anglo-Saxon and some of the Norman churches, a stone bench running round the interior of the church, except the east side, was the only sitting accommodation for the visitors. In 1819 the people are represented as sitting on the ground or standing. A little later the people introduced low, three legged stools promiscuously over the church. Soon after the Norman Conquest wooden seats were introduced. In 1387 a decree was issued in regard to the wrangling for seats, so common that none should call any seat in church his own except noblemen or patrons, each entering and holding the one he first found. From 1540 to 1580 seats were more appropriated. In 1608 galleries were introduced, and as early as 1614 pews were arranged to afford comfort by being baized or cushioned, while the sides around were so high as to hide the occupants—a device of the Puritans to avoid being seen by the officers, who reported those who did not stand when the name of Jesus was mentioned.

PERSONAL ITEMS.

Speaker Randall has appointed as his private secretary a son of Beverly Tucker.

General Alphonso Ferraro La Marmora, a well-known Italian General and Statesman, is dead.

Speaker Lord, of the Main Legislature, is but 30 years old. Hannibal Hamlin filled the chair when only 28.

Lord Dufferin's successor, as Gov. General of Canada, the Duke of Manchester, is married to an American lady.

George Law, forty-five years ago, was a common day-laborer on the docks, and now counts his fortune at something like $10,000,000.

Thirty-seven wives are waiting for Osman Pasha in Constantinople—enough to reconcile him to a winter in the neighborhood of Moscow.

Marshall O. Roberts, of New York, is the possessor of $4,000,000 or $5,000,000; and yet until he was twenty-five, he did not have $100 he could call his own.

Long John Wentworth, of Chicago, a man of great wordly experience, says no bank is solid that has anything to do with religion, politics or real estate.

Alexander T. Stewart first bought a few laces at auction, and opened his way to success in a dingy little shop in Broadway near the site of his wholesale establishment.

Daniel Drew, in his early life, was a cattle-driver at the munificent rate of seventy-five cents a day, and he drove himself into an estate valued at from $25 000,000 to $30,000,000.

The proprietors of the London Daily News have sent Mr. Forbes a check for £1,000 as an acknowledgment of his great services to their journal in connection with his war reports.

Horace B. Claflin, the eminent dry goods merchant, worth, it is estimated, from $12,000,000 to $15,000,000 commenced the world with nothing but energy, determination and hope.

Gov. Connor of Maine says: "Men are finding out that it is better to seek the sure rewards of the farm than to trust to the uncertainties of the crowded towns for a living."

Robert L. and Alexander Stuart, the noted sugar refiners, in their boyhood sold molasses candy, which their widowed mother had made, at a cent a stick, and to-day are worth probably $5,000,000 apiece.

When old Jubal Early heard of Lee's surrender he was lying in an ambulance, racked with rheumatism; he swore like a pirate for a moment, and and then turned in his uneasy bed with a groan and exclaimed. "Blow your horn, Gabriel!"

Mrs. Hayes has a genuine liking for the White House, old-fashioned as it is. She took an old friend through it the other day, showed him the great rooms, and exclaimed; "No matter what they build, they will never build any more rooms like these!"

Cornelius Vanderbilt began life with an old pirogue, running between Staten Island and New York, and carrying garden stuff to market. With two or three thousand dollars raised from that source, he entered upon steadily increasing enterprise until he amassed the enormous sum of $95,000,000.

Olive Logan writes to the Cincinnati Enquirer, that Mr. John Russell Young, manager-in-chief of the New York Herald, has been stricken down in a very alarming way with what it is feared is paralysis of the brain. He now goes, by command of his physicians, to Egypt, for a favorable climate, and where he can have the most intense quiet—the only thing that can save him.

Senator Gordon, of Georgia, is forty-six years old; his grandfather was a Revolutionary soldier; at the battle of Gettysburg a bullet went through the Senator's left cheek; altogether he was hit by seven bullets; he is the political hero of Georgia, and, according to Redfield, "Gordon has war record and lots of it, so much so that a little more would have been all record and no Gordon."

Young Jersey Bull

For sale. Mulberry fawn, with little white, entitled to registry; dropped January, 1877; sire Imp of Darkness, 807; dam Belvira 2d, 5910; bred at Ogden Farm. His fine breeding and rich, mellow skin would make him a valuable acquisition to any herd. Price $75, free on cars here, crated. C. S. BUNNELL, Syracuse, N. Y., care BRADLEY M'F'G CO.

HEREFORD CATTLE.

For sale by private treaty: Yearling Bulls of the fashionable "Cronkhill" and other well-known tribes, possessing great scale and heavy flesh, with abundance of good hair and grand character. In healthy, growing condition, and not pampered for show. Also, a few choice Cows and Heifers. For full particulars, apply to the breeder, JOHN HILL, Felhampton Court, Church Stretton, England.

PARTICULARLY

FOR THE LADIES!

THE RURAL NEW-YORKER, at the instance of Miss FAITH RIPLEY, conductor of the Department "For Women," offers, as one of the most valuable and acceptable Premiums of the season, a Steel-Plate Engraving, size 24x32.

The subject,

"OUGHT AND CARRY ONE,"

portrays a pretty young girl, gracefully poised, and holding pressed against her side, a slate on which she is "doing sums." The contracted brow, puzzled expression and drawn corners of the mouth, express most comical dismay.

This charming picture is printed from a new plate, the lights and shadows are clearly defined, and this work of art, when nicely framed, is a decided ornament.

Nothing is more refining and elevating than *good* works of art, and we confidently proffer this as something greatly in advance of anything heretofore announced.

We anticipate that this offer will appeal especially to our lady readers, and in order that the picture may be placed within the reach of all, we have scaled the club so low that it partakes more of the nature of a gift than a premium.

5 SUBSCRIBERS AT $2 EACH,

will entitle any one to the Engraving.

For specimen copies and outfit for canvassing, address

RURAL NEW-YORKER,
78 Duane St., New York.

Implements and Machinery.

Switzerland to America Greeting.

The Centennial Judges having awarded to the Messrs. BOREL & COURVOISIER 2 Prizes at the late Centennial Exhibition for their production, one for extreme accuracy in adjustment and regularity in performance, and the other for display, they are now offering their Watches at a great reduction from former prices, having introduced improved machinery, whereby the production is increased, and the cost of manufacture greatly reduced, and the quality and durability improved, insuring a first-class NICKEL MOVEMENT WATCH within the reach of all. These Watches, so favorably known for the past 18 years, are made of the best material, and have all the modern improvements in watch making having **Chronometer Balances, Breguet Hair Springs, Tempered, Hardened and Isochronised for R. R. Travel, Fine Ruby Jeweled,** and are warranted to perform with the regularity and accuracy of a Chronometer. These Watches are for sale by all our local agents throughout the country, and parties desiring a good and durable time-keeper, are requested to examine them before purchasing those of other manufacturers or home productions.

SPARKS AND SPLINTERS.

THE first thing in the boot is the last.

TRUE to the last—A well-made boot.

A KNIGHT of the bath—Saturday night.

A QUACK doctor is not a "duck of a man."

FOOLS and their back hair are soon parted.

A GOOD thing to put in practice—A young lawyer.

"CAN marine animals talk?" Certainly; seal skin.

A DEAF man must go away from home to hear the news.

How to make a catfish—Leave her alone in a room with an aquarium.

PHILADELPHIA has just had a cat show. Here cats don't get any show whatever.

MAY not the venerable editor who prefers old to new jokes be called an old saw sage?

"WHAT an idle fellow you are, Fred! You do *nothing!*" "Because there's no time to do *anything!*"

"LIFE is made up of sunshine and shadow"—about five shaddos to one sunshine.—*Josh Billings.*

IT's a wise child that knows its own father, and a wise cask of vinegar that knows it's own mother.

MINCE pies cover a multitude of sins, as the deacon's wife said when he brought home the demijohn.

THE heart of the Russian army ought to beat very high, it has been so often re-pulsed.

THE old ten-cent paper currency is fast disappearing. A friend of ours is keeping a sample as a memento, and already calls it a dime, novel.

"CHARTER OAK stoves," says an advertisement. Most people would prefer to charter iron ones for practical purposes.

HE wasn't a first-rate French scholar, or he'd never have said that Tilden's Sam-singing is all confined to "*sang fraud.*"

MRS. SMITH, of South Boston, is so stingy that the only things she is known to give away are shoos to her neighbor's chickens.

THE Lowell Courier has discovered that Cleopatra was a needle-woman. Perhaps so. But there Antony doubt she had other asp-irations.

FRENCH dame to the family physician—"Doctor, I want my husband to take me to Nice for the winter. Now, what is the matter with me?"

A YOUNG upstart undertook to insult a widow, and she smote him over the head with a stove shovel. He went off rubbing his head as if he was dissatisfied with the widow's smite.

THE papers relate an anecdote of a beautiful young lady who had become blind, having recovered her sight after marriage. It is no uncommon thing for people's eyes to be opened by matrimony.

A GENTLEMAN had occasion to correct his daughter, aged four, recently. After it was over and she had sat a while, she went to her mother and inquired, "Don't you think it would do papa good to go out doors?"

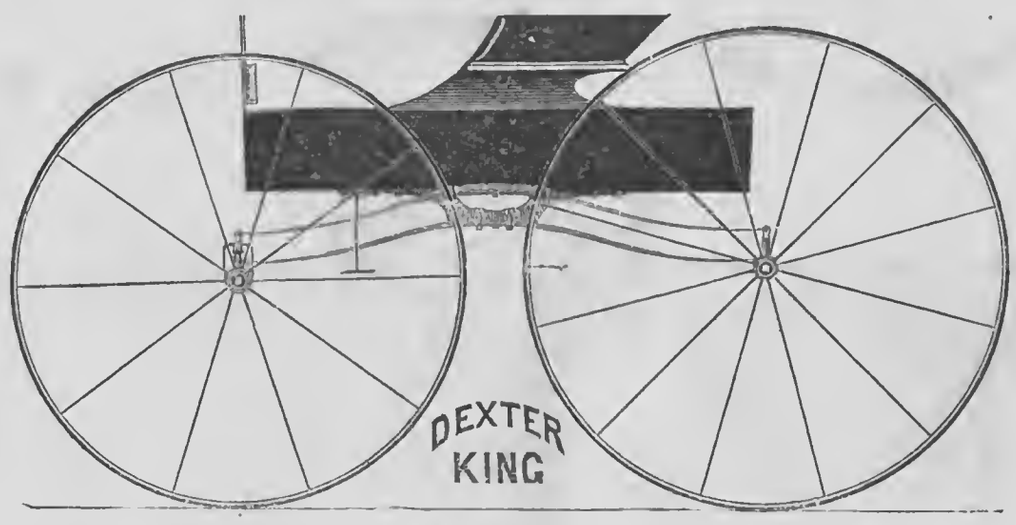
"MADAM, did you ever lift a dog by the tail?" "Why, no, you cruel thing, you!" "I didn't know, because I saw you carry your little child across the gutter by one arm; a dog's tail is a good deal stronger than the ligaments of a baby's shoulder."

EYE SUPPOSE SO!

OLD WOMAN—"What a lot o' eyes these 'taters have got!"
OLD MAN—"I specs they's extra, so as to look arter the Colorado beetle."

THE LUNGS are Strained and Racked by a persistent Cough, the general strength wasted, and an incurable complaint often established thereby. Dr. Jayne's Expectorant is an effective remedy for Coughs and Colds, and exerts a beneficial effect on the Pulmonary and Bronchial Organs.

The Celebrated Dexter Spring



COMBINES

STRENGTH, DURABILITY AND COMFORT,

At Moderate Cost.

THE SPRINGS FORM THE REACH OR COUPLING.

The Dexter consists essentially of two "concord" or side-springs upon each side of the Buggy, one spring above the other and parallel to it. The two springs are rigidly attached to each other at their centers, and are pivoted at their ends to spring shackels above, or on either side of axle and head block.

TO PUBLISHERS.

THE RURAL NEW-YORKER has accumulated a very large number of desirable Wood Cuts, Electrotypes, etc., representing illustrations that have appeared in this journal from time to time. We have had numberless inquiries from publishers, asking our terms for such cuts as were desirable to them; but we have never, until the present time, had them arranged in a manner that made them easy of access for reference.

We are now prepared to fill orders for these Cuts, and as we do not care to do more than secure a part of the first cost of the pictures (having used them once), we shall make the prices very low. Similar Cuts cannot be bought in New York for less than 20 cents per square inch, and from that price ranging up to 50 cents, according to the quality of the work.

We now offer any Illustration appearing in the RURAL NEW-YORKER, at the following price, delivered in New York:

TEN CENTS PER SQUARE INCH.

All expenses of postage or expressage must be borne by the purchaser.

The Poultry Yard.

VARIETIES OF POULTRY.

We introduce in this picture a few of the leading varieties of domestic poultry. In the center of the group stands the father of all domestic fowls, the stately Game-cock. With his bold carriage, erect bearing, bright glossy plumage but cruel eye, he is dauntless and courageous to a degree that is not surpassed by any animal on earth.

On the left hand is the big, heavy Brahma of the light variety; his large, heavy, feathered legs are well adapted for carrying his weighty body; his plumage is thick and fluffy behind, making him look even heavier than he is; his wings are tucked up so tightly that he scarcely shows them, the ends being entirely covered with his saddle feathers. The eye of this bird is of such a soft, mild appearance that it shows at once his gentle, docile disposition; for although his comb and wattle are small, yet he does not look fierce or restless.

Over his back is seen the head of that beautiful bird, the Hamburg. Although there are five varieties of this breed, their forms are all alike; their fine, rose combs and brilliant dresses give them a prominent position among poultry, especially where fowls are kept for beauty as well as profit.

Between these two last birds at the bottom of this picture, is seen the bright little game bantam—the embodiment of all the qualities of his "big brother," but done up in a smaller parcel. He, however, does not know that, and thinks himself equal to any emergency.

Behind the central game cock stands the dark Brahma, fully as large as his creamy-white brother; but his colors are very different, as he has a black breast; steel-gray and black are the principal colors of his body, supported by his huge legs.

Facing us, to the right, is the round, large top-knot of a Polish hen, as round as a base-ball, with the two pretty horns of coral-like comb. There are several varieties of this breed, but the pure black, with white top-knot, are much the handsomest.

In the top right-hand corner, is the head of the massive Cochin. Like his Brahma brethren, he can stand our severe winter (if well fed) with seeming indifference; the hens laying all through winter.

Below him we see the beautiful French Houdan. He, too, has a coral-like comb and top-knot, the latter of which is not so large as that in the Polish; but, see his fine large breast! There is something worth breeding for the table, especially as it happens to be of delicious quality! His colors are spangled black and white; he has five toes, and clean legs.

At the extreme lower right corner, we have the sauciest of all fowls, the consequential little Seabright Bantam. His walk is so proud that he seems as though he did not like to touch the ground with his feet; he struts about on his toes with the proudest gait; and well he may be so proud, for he boasts of the prettiest, delicate, lace-like plumage of rich gold color, with green-

VARIETIES OF POULTRY.

ish-black lines on the tips and edges of all his feathers. A flock of these on a green lawn is a very pleasing sight.

THE PROFITS AND LOSSES OF RAISING POULTRY.

JOSEPH WALLACE.

NO. 3.

Poultry writers differ about which is the best breed of fowls to keep. Some are influenced by motives best known to themselves. Others have "axes to grind," and a few have their likes and dislikes. Farmers, and novices in the poultry business are at a loss to know which breed is best adapted to their wants. They read in poultry journals glowing descriptions of this or that breed of fowls. They see the most extravagant, ingenious and exaggerated statements about excelsior strains—newly imported breeds from the northern province of China—or perchance from the jungles of India, and winding up as a rule with the same stereotyped three to six dollars a "setting" for eggs, and five to fifty dollars a pair for these *rare birds*.

I have heard many complaints the past year from parties in the West who had patronized some of these unscrupulous dealers, and the same old story is reiterated about non-impregnated eggs, and the *pedigree fowls* were sickly, wretched specimens of in-and-in-breeding. However, it is well that there is a class of such Shylocks in the country, for honest poultry breeders who charge moderate prices for their eggs and fowls will always command ready sales.

Poultry raising to be profitable, requires a thorough knowledge of the business on the part of the keeper. First, he should be located near some city, town, or railroad station. He should procure one or two or more good breeds. Secondly, he should provide clean, comfortable houses for them in winter and airy roosting places in summer. Thirdly, when the two former *essentials* have been attended to, he should give his fowls, cooked, parched, and raw grain food regularly three times a day, with a plentiful supply of fresh water. He should feed chopped meat scraps, vegetables cut fine or cooked with some kind of ground feed a few times a week during the winter months. He should provide pulverized oyster or clam shells, chalk, bone, or old slaked lime, also boxes of coarse sand or gravel for their use. Fourthly, he should clean out his fowl houses every day, whitewash every week, and fumigate every month. He should not crowd too many hens into a house—forty are enough. He should colonize them if possible, and be careful to avoid in-and-in-breeding, no matter how valuable the breed. And by following these rules he can make poultry profitable; if he neglects them, he will find fowl raising an "up hill work," and a non-paying business.

TO MAKE POULTRY PAY.

HENRY HALES.

WINTER TREATMENT.

For hens to lay in winter, it is necessary that they should be supplied with all the requirements of food, egg-shell matter, cleanliness and care, to keep them in a high state of health and condition. Good feeding is all that is required by nature for egg producing. This substance is better supplied by giving them sound, sweet food liberally, than by any artificial condiment or preparation sold for the purpose. The high price of such preparations, however good they may be, puts them beyond reach of the farmer to get a profitable return for the outlay. A trifle invested in a few simple things, such as pepper, pulverized charcoal, sulphur, and cayenne, answers all the purposes of keeping the birds in health. Even these should be used sparingly once or twice a week. When a fowl is found to be ailing, it must be separated from the others and treated with proper medicines for the disease. Such are now pretty we understood by practical breeders and poultry keepers.

Some years ago, hardly anything could be done for a sick fowl; but care and patience have found antidotes even for the most stubborn diseases, which, if taken before the bird sinks too low, will generally effect a cure. A farmer, however, cannot afford to spend much time on a hen, though valuable fowls are worth the trouble. Yet, when he finds any appearance of disease in his flock, he must make an effort to stop it at once, and not, as many will insist upon, leave them to their fate. In most cases, the spread of disease is easily prevented, if taken in time. After removing the diseased ones, a little sulphur and cayenne mixed in their soft food, a teaspoonful of sulphur and half as much of cayenne to four quarts of food given for two or three days, will generally arrest an ordinary trouble. The sulphur should be stopped, but the cayenne may be continued to be given as the birds recover. Indeed, it may be given to advantage once or twice a week all through the winter. Iron is a great tonic for ailing fowls, when first noticed to be out of condition. It is generally used in a simple preparation known as "Douglas' Mixture." It is sulphate of iron, common copperas eight ounces, and sulphuric acid one-half fluid ounce. These, put in a bottle with a gallon of soft or rain-water, are ready for use as soon as the iron is dissolved. All keepers of poultry should have this and other medicines on hand before any sickness is discovered, so that no delay occurs when promptness is required. Of special diseases I shall treat hereafter. I have in former articles spoken of disinfecting the house and the necessity for the dust-bath, and of a supply of bone and oyster-shell.

The food should consist more of other grains than of corn. Although all kinds of poultry seem to prefer corn to other grain, yet corn has been proved by a great many poultry-men to be inferior as an egg producer to wheat, barley, &c., and occasionally to buckwheat and oats. Corn may be given sparingly with advantage, but corn alone makes hens too fat and lazy. So fed they lack animation and vigor, especially the Asiatic breeds, which are more prone than other strains to this fatness that seems to border on disease. Their intestines become encased in one mass of fat, and to stint fowls to any given quantity of food especially when confined, is quite impracticable. Soft food given once a day in winter, is very beneficial, particularly during spells of severe weather. It promotes laying. It should consist of ground grain, as corn, buckwheat, barley, wheat or oatmeal, varied at times, with some vegetable and animal food. I make up mine by boiling a lot of potatoes or turnips, pouring the hot water (in which they were boiled) upon some meal in another vessel, with ground beef scraps added twice a week and a little cayenne. Make this into a stiff paste. Mash the vegetables and add meal enough to make this also into a stiff mass. Mix them together and feed when just warm. Most breeders recommend this to be done for their morning meal, but this will often keep the stock waiting hungry too long. Have light grain for them always, early every morning, and feed with the soft food by noon if not sooner, and all the grain they will eat for evening meal.

If these directions, with former ones in the Rural, do not make poultry pay, the fault lies in some other cause.

Farm Topics.

AGRICULTURE AND EDUCATION IN THE UNITED STATES.

PROF. I. P. ROBERTS.

No. 3

Having indicated in my last, the work that is accomplished yearly by the Agricultural and Mechanical schools in the direction of instruction and drill in military tactics, I will pass to the consideration of their work in other branches.

The larger part of what follows is condensed from an article written by me, and published in Kiddle and Schem's Cyclopedia of education.

At the close of 1875 there were 27 colleges or departments of colleges, organized by virtue of the grant of 1862, and several others in process of organization. The date of their organization and the places of their location are as follows. Arkansas, Fayettville, '71; Alabama, Auburn, '72; California, Oakland, '69; Connecticut, New Haven (Scientific School,) '46; Georgia, Dahlonega—; Illinois, Champaign, '68; Indiana, La Fayette, '74; Iowa, Ames, '68; Kansas, Manhattan, —; Kentucky, Lexington, '66; Maine, Orono '69; Maryland, Hyattsville, '68; Massachusetts, Amherst, '67; Michigan, Lansing, '55; Minnesota, Minneapolis '68; Missouri, Columbus, '70; Nebraska, Lincoln, '72; New Hampshire, Hanover, —; New Jersey, New Brunswick, —; New York, Ithaca, '68; Ohio, Columbus, '73; Oregon, Corvallis, '68; Pennsylvania, State College; Rhode Island, Providence—South Carolina, Orangeburg, —; Tennessee, Knoxville, '69; Vermont, Burlington, '65; Virginia, Blacksburg, '72: Wisconsin, Madison, '68. It will be noticed by the dates given, that all of these colleges or departments are of very recent origin, with the single exception of the one in Michigan. [New Haven? Eds.]

All of these colleges received their proportion of the scrip mentioned in the preceding article. The issuing of such a large amount of it, caused its market value to fall to a very low figure; and even could it have been sold at the rate of $1,25 per acre, the fund derived, in most instances, would have been totally inadequate for the maintenance of even a second-class institution. This fact made it necessary in several cases to give the scrip to some old and well-equipped college, only requiring that they should organize and equip a department for instruction in Agriculture and Mechanics.

The wisdom of this policy (at least in some instances,) cannot be questioned, for it was simply choosing between a department in a well-established college or nothing. As to whether these old colleges have fulfilled their contract is another thing. Without making any distinction, let us see what provision for teaching they have collectively made in this brief time, and also what they have accomplished.

At the close of 1875, there were 300 professors and instructors actually engaged in teaching, and 5893 students being taught such branches of learning as relate to Agriculture and Mechanics, either directly or indirectly. So far as reported, 361 students had graduated after a full course in Agriculture. Allowing the usual proportion of freshmen to graduates this would indicate that 1444 had pursued that course for a longer or shorter period.

The number of *graduates* who have pursued studies relating to Agriculture and the Mechanic arts is 669; making the total number who have entered the courses for a longer or shorter period, 2676.

The number who have graduated in the last two years, or the number who are now registered in these courses, I am unable to state; but if the increase in the other colleges has been anything like that at Cornell University, (which had 17 in Agriculture in 1875 and now has 38) it would appear that the work already accomplished is not inconsiderable, and that the prospects for the future are encouraging.

EQUIPMENTS.

The number and equipment of Laboratories, Workshops, etc., (in 1875) that serve to illustrate and teach, are as follows: Mechanical laboratories and workshops, ten; all of which are furnished with necessary appliances for working in wood and iron: physical Laboratories, sixteen; most of which are furnished with apparatus for illustrating the subjects of Mechanics, Electricity, Magnetism, Heat, Acoustics and Optics.

All, with one or two exceptions, have well equipped chemical laboratories and several of them furnish facilities for instruction, not excelled in any other institutions in the United States. Nine Anatomical, twelve Geological and fifteen Botanical Laboratories are already equipped for student practice. Eight of these colleges have green-houses in operation, and nearly all have draughting rooms with necessary tables and models for illustrating the subject taught. Some ten colleges have large collections of models of farm implements and machinery, engravings, photographs, charts and drawings, together with numerous specimens of grains, grasses, and other plants; geological and mineralogical specimens, collections of insects and skeletons of domestic and other animals.

The aggregate number of acres used for general and experimental farming is 5081 added to which there are 142 acres of orchard, 92 of vegetable garden, 29 of small fruit, 1360 of native timber, 438 of planted timber, and 580 used as college grounds. We also find 500 head of neat cattle, 236 of which are thoroughbreds representing nine distinct breeds. The horses and mules number 129, only 3 of which are thorough-bred; with 233 sheep of which 58 are pure-bloods of various breeds, and the swine exceed 500, including about 400 pure-bred animals, representing nearly all of the well established breeds. This aggregation of laboratories, workshops, museums, greenhouses, orchards, gardens, farms and domestic animals, is furnished and provided for the express purpose of affording not only the means of illustrating the subjects taught, but actual experience and skill in those processes which require that the judgment, eye and hand, as well as the intellect, should be trained. At least twelve appear to have kept careful and separate accounts of farm receipts and expenditures, but since we have no reports of the amount of increase in the valuation of farm stock, implements etc., it is impossible to state the exact profit or loss; but I am assured from reliable sources, that at least six of them show a fair profit, exclusive of cost of experiments and for aught I know all of them may. The gross receipts of the twelve farms as reported for 1874, was $64,329,00. The total expenditure for *experiments* on eight of them was $8,143,00. This indicates that farm experiments are not carried on to so great an extent as we could desire, as they are effective auxiliaries to the class-room instruction, and the only thing that can prevent their more general use is the heavy cost.

The common idea that the farm must be so conducted as to attain the greatest pecuniary profit, is one which if carried out to its legitimate results, would defeat most of the objects for which it should be used. The better idea is this; conduct the farm under two heads or accounts—where it is large enough—general and experimental.

If the general farm cannot be made to pay a fair profit, then sell it; but it is simply nonsense to talk of pecuniary profit in numerous and extended experiments. As well might you expect a great university or college to be run on the same principle.

COURSE OF STUDY.

Below will be found a list of the subjects taught in the full course of four years in Agriculture (in some cases a few are omitted or added), but those mentioned will serve to show what studies are now generally considered applicable and necessary. Those printed in italics are now actually taught in this course at Cornell University, and two or three other subjects of a more general nature are frequently added at the option of the student.

(1) *Algebra*; (2) *solid, plane* and analytical geometry, *trigonometry* and calculus; (3) *rhetoric* and *composition, declamation* and *English Literature*; (4) *drawing, free-hand* and *linear*; (5) *surveying* and *mapping*; (6) book-keeping; (7) *botany, general* and *agricultural*; (8) *horticulture, floriculture,* and *general market,* and *landscape gardening*; (9) history, which may comprise one or more of the following: American, English, Roman, French, *agricultural,* and history of civilization; (10) *physiology, hygiene* and comparative anatomy; (11) *zoology* and *entomology*; (12) *veterinary anatomy, physiology, medicine* and *surgery*; (16) *chemistry, general* and *agricultural*; (14) French and *German*; (15) *physics, geology,* mineralogy and meteorology; (16) *constitutional* and municipal law and *political economy*; (17) *mechanics applied to agriculture*; (18) *strength* and *preservation* of *materials*; (19) *rural architecture.*

The subjects treated under the head of applied or practical agriculture—with slight changes—are as follows:

(1) *Stock-breeding, including the laws of likeness or similarity, variation and atavism; the influence on the subsequent progeny of the dam by the first fruitful connection, in-and-in and miscellaneous breeding, the government of sex, the relative influence of sire and dam on the progeny, pedigrees and their value, the history, formation, and charisteristics of breeds and families*; (2) *the selection, breeding, feeding, and general management of domestic animals, each species and race being treated separately*; (3) *animal nutrition*; (4) *the education, shoeing, driving, and care of the horse*; (5) *drains,—their material and construction, and the effect of drainage on health, soil, climate and plants*; (6) *soils—their classification, character, mechanical division and preparation for the cereals and grasses*; (7) *the preparation and selection of seed*; (8) *sowing, planting, cultivating and harvesting*; (9) *the nutrition of plants*; (10) *insect enemies and fungi*; (11) *the culture of roots, and their value as food for man and beast*; (12) *forage plants—their culture, use and value*; (13) *weeds—their habit of growth, time of seeding, and mode of eradication*; (14) *the effects of air, water, heat and light, on the fertility of the soil, and the growth of plants*: (15) *the care, cultivation, and use of natural and artificial forests*; (16) *fields—their number, shape and size*; (17) *fences—their material, construction, and durability*; (18) *farm-yards and buildings*; (19) *water privileges*; (20) *farm accounts*; (21) *the manufacture, preservation and application of farm manures*; (22) *the rotation of crops*; (23) *farm machinery and tools*; (24) rural law.

The subjects of instruction, as far as possible, are illustrated by diagrams, cuts and models. The lectures are supplemented by field practice, varying from five to fifteen hours per week and sometimes even more. Visits are frequently made to adjoining farms and herds. The lectures and practice in practical Agriculture usually extend through at least one year.

Cornell University, Ithaca, N. Y.

*Errata.—In No. 1 read JethroTull for Jethro Hull.

JOTTINGS AT KIRBY HOMESTEAD.

COL. F. D. CURTIS.

We used to think that clipping horses was a cruel practice. This decided opinion was established from seeing so often in the streets of New York clipped carriage horses shivering in the streets, uncovered, while the lazy grooms sat tucked up in robes and muffled to the very eyes. Perfectly comfortable themselves, what cared they if the horses were freezing, while the ladies called, or shopped? We say "we used to think," clipping horses was cruel and so it was and is when they are to be left to the mercies of such drivers. We knew it was less work to clean them, but this did not offset the exposure to the cold, sweeping winds of New York, and the danger of colds and sickness. There is no necessity for clipping the carriage horses of any city, as the work demanded is not severe enough to require it. With trotting horses and those driven long distances it is different. The owner of a fine pair of carriage horses, who, at most, only takes a turn in the park, is a foolish man, if he allows his groom, in order to lessen his labor, to have his team shorn of the natural protection they need in winter and most emphatically require for the work he desires them to do. Perhaps a farmer ought

to keep silent, as the more horses that are killed by this sort of management the better market there will be, but farmers are humane and they have sense enough to see how, in many instances, a pretentious coachman would recommend having the horses shorn as an advantage to them when it was not, but only enabled him to keep them clean much easier. This is one of the reasons for clipping and, for ordinary city service, the only one. In the country, where horses are often put to severe use, and driven long distances, it may be an advantage to denude them of their coats, especially if they happen to have very long and thick ones; yet it seems as if they would not have a thick warm coat unless they required it. This peculiarity in some horses may be accounted for by the manner in which they were raised when colts. A colt wintered out of doors will naturally have a much thicker and longer coat than one well protected. A natural propensity to grow a thick coat may be established in this way, which in after years is unnecessary owing to the care given to it and may be cut off so that the animal's condition may really be equal. We never knew a thorough-bred horse to have a long shaggy coat, and this goes to show that the thick coat is not so much a necessity for a horse as it is the natural result of the conditions which surrounded him. If this is so, then there is no force in the argument that a horse's coat is suited to its particular or peculiar temperament and nature. The fact probably is that any horse if exposed to the elements when a colt, would have a shaggy coat without any regard to its temperament. All animals in cold climates have thicker hair or fur. Put one of these animals at work where its temperature is very much increased, and the coat suited to the frigid zone is a burden, so if a horse happens to have a thick, heavy coat of hair and hard work is required of him, it is well to remove the burden. He will perform his task better. When the work is done or he is left standing in an exposed place, he should be immediately covered. The practical advantages of clipping horses in the country have been found to harmonize perfectly with the above theory. Twenty horses have this year been clipped in this vicinity and mostly owned by farmers. Last year only three. This large increase demonstrates the practical utility of clipping as against any theory in the minds of country people. But one horse in this vicinity out of the above number has ever been sick and this one took a severe cold The owners of these animals insist that their horses can do more work and do it with less fatigue than before they were sheared. They claim that they eat better and perspiring less, keep in better condition on the same amount of feed. There is no doubt but that with a free evaporation, the skin being clean and the body free from scurf, there is less itching and less danger of fever and kindred diseases. One horse which pulled its blanket off after being driven and warmed up because of the itching, after it was shorn never disturbed the blanket. About a bushel of hair is taken from each horse, although some of them turn off a bushel and a half. It would be a good plan to shear a heavy coated horse early in autumn, and then the hair would start out before winter and with a half coat he would do well. The change would not be so great as if he was denuded of his winter covering just as cold weather set in. A horse when clipped does not heat so much, and not getting so hot is less liable to get a cold. They are also not so subject to scratches. A horse with a heavy coat, if used every day, will not be dry all winter, as it takes from twenty-four, to forty-eight hours for the hair to dry. With a hand machine costing eight dollars, a horse can be shorn in a half a day. With the larger machines requiring two men to work them, three horses may be clipped in a day. The general price now is three dollars for clipping each horse.

We have two bull calves which, on account of close keeping last spring, became pot-bellied, which injured their looks very much. They are now large and strong and in good condition and, except for the excess of stomach, would be first-class in every respect. Three days ago, we put them up in a box stall and commenced a system of dieting which we expect in a few weeks will completely change their appearance. In the morning they are fed a peck of turnips cut up with four quarts of meal. At noon they each get a single handful of hay and at night turnips and meal, the same as in the morning. The meal consists of two parts of flint corn ground in the ear and one part of wheat bran. They get no water as the turnips supply all that is necessary. They manifest no discomfort or uneasiness, but on the contrary, seem to be quite satisfied with the shortened and condensed rations. We like to see a good-sized stomach on a cow, as it is an evidence of capacity to consume and assimilate a large amount of food, but in a male it is a blemish, as it destroys the symmetry and proportion of the body. A cow with a small stomach is generally a poor one.

The other day we called over to neighbor VANGUYSLINGS and found him halting between two opinions. It was a question of lightning-rods and shade, *versus* dirt and sunshine. Three tall and handsome Locust trees stood so near the house that they were natural protecters against lightning, and at the same time shaded a considerable portion of the house, as the branches stretched out over the roof and reached beyond the ridge boards. On the other hand, the blossoms in early summer and the leaves in autumn filled the eave troughs with dirt, which was carried into the cistern. He had come to the conclusion that sunshine on the house was more healthful than shade, and the only doubt in his mind was whether the dirt from the trees was not so much of a nuisance that it more than offset the protection which he might have from the lightning by the lofty trees which reached so far above the house. The dripping from the trees stained the clap-boards and siding, and so they were condemned. We regretted the conclusion and thought how much better it would have been if these noble trees had been set a little farther off. We have made the same mistake ourselves in planting trees in not taking into the account the fact that when they grow larger they will be much nearer together and much closer to a building than when they are small. There are several orchards in this vicinity in which the trees are so close together that the branches interlock, and the trees are not more than half grown, every other row will have to be cut down. How many gardens are spoiled, too, by planting so many trees in them. As soon as they grow up they shade the ground and its usefulness as a garden is destroyed. We have made this mistake, and had to abandon one garden entirely. Last spring we had to choose between several Rogers' grape-vines and a favorite apple tree. That law of natural philosophy learned in our youth that "two bodies cannot occupy the same space at the same time," comes back to us with practical force, and the apple tree was cut down. In thinking where to set new trees, all these things must be considered, or else in many instances just as they begin to bear the fruit we have waited for, they will have to be destroyed, or as they grow up they will destroy other plants, or damage the buildings. Every tree wants the sunshine and plenty of it to do well.

Farm Economy.

THOUGHTS ABOUT WINTER FEEDING.

WM. J. FOWLER.

How long shall we feed fattening animals? At what time during the fattening process is there the greatest gain for the food consumed? These are important questions, and deserve much more attention than they generally get. Quite often farmers do not regard them at all. They feed till their surplus grain is exhausted, and then they kill, or else feed till a certain date which they had decided on as butchering day. Very often, by this loose method of doing business, animals are kept long after the date of profitable feeding has passed. Sometimes, though less frequently, they are sent to the shambles too soon.

When the animal is fairly fat, the gain from further feeding will rarely pay the extra expense. The increase in gain falls off rapidly as the animal becomes thoroughly fattened. For home use, this is not all loss, as the very fat beef, or mutton, or pork, is richer and better than that only partially fattened, which contains a greater proportion of water, and thus wastes in cooking. But in this country the buyer rarely makes any difference in price. English consumers have learned the difference, and they demand the very best. As our foreign market for American beef and mutton increases, farmers and stock feeders must learn to adapt their wares to English tastes and English markets.

One of the greatest wastes in fattening is in the use of soft corn or nubbins, thrown in the ear to fattening hogs. It is a slow, wasteful and costly mode of fattening pork. Too often these nubbins are looked upon as valueless, and if the farmer gets his year's supply of pork from them, he easily fancies that it costs him nothing. In fact, much of the corn thus wasted is ripe and sound, and needs only to be well dried to be ready to shell and grind, and thus be worth, for feed, at least three or four times as much as the farmer makes from it. If really unripe, it should be fed early to cattle which will eat cob and corn together. In its green state, there is considerable nutriment in the cob, and if any corn passes through the animals only partly digested, it can be saved by having store hogs kept in the same yard. There is great advantage in feeding green corn early. After freezing weather comes, the nubbins become hard as ice from frozen sap, and make the animals which eat them, sore-mouthed.

Feeding of any kind of animal should begin early, and be well advanced before cold comes. In this way the greatest amount of flesh and fat can be laid on at least expense for food. Hogs especially, should be got out of the way early. If properly kept, they will be half fat all the time, which is only good, thrifty, growing condition, after which a few weeks' feeding on cooked corn meal will complete the fattening, and make the flesh firm and solid. If possible, have them butchered as early as December, as cold weather rapidly diminishes the capacity to lay on fat.

It may be urged that early slaughtering will glut the market. But there is no need for selling pork as soon as butchered, especially when the price rules as low as now. Money is usually made by pork packers, else they could not continue the business. The farmer who has grown and killed the pork is better able to hold it than any one else can be, and he may as well have the profit as anybody. Very often several barrels of well-kept pork may be sold in the farmer's neighborhood to those who failed to provide a supply. Pork in the barrel gains in weight by the salt it absorbs, thus making a double profit in keeping it. At present low prices of pork, farmers who have facilities for packing it, may do so with little or no danger of loss.

The only kind of stock which it is profitable to fatten in cold weather is sheep. If kept dry they will thrive, no matter how low the temperature, and with plenty of water and good feed, they will eat more heartily in severe weather than when it moderates. In a barn basement or a close shed, a flock of fattening sheep will usually keep the temperature above the freezing point.

NOTES FROM MAPLEWOOD FARM.

HECTOR BERTRAM.

It is poor policy to endeavor to raise early lambs when you have no warm, sheltered place for the ewes, away from the rest of the flock. True, early lambs bring fancy prices for early mutton, yet a farmer who has no suitable place for them during the cold storms of March, cannot raise them to advantage. We have known men to lose two-thirds of their lambs from no other cause than that they had no suitable quarters for them. When lambs are not dropped until warm weather fairly sets in, they thrive much better, and there is scarcely ever a loss, provided the ewes have received suitable care. Sheep, especially breeders, should have ground grain through the winter and in the spring, when the lambs come late. Some years ago, we were an [illegible] of the family of a Michigan farmer who, every morning, gave a flock of forty sheep the meal from about twelve quarts of corn, dry. They ran out through the day, and at night were shut up in a warm stable and supplied with plenty of good hay. This hay and meal constituted the entire feed each day, save what they could pick about the stack pen, yet I never saw finer sheep, and at any time during the winter any or all of the flock were in first-rate condition for mutton. A *little* grain is of more real benefit to sheep than to any other animal; and speaking of ground grain, it is, in our opinion, injudicious to feed whole grain to any animal. A neighbor's fattening pigs, fed on corn in the ear, shrunk materially the last few weeks that he kept them, simply because their teeth became so sore, from eating the hard grain, that it was impossible for them to grind a sufficient quantity to keep them in condition for butchering. Cooked, it might be better; but ground and then cooked, you get the full benefit of its fattening qualities. Every farmer should have a large kettle or steamer in which to cook grain for all his stock, horses not excepted. A warm feed of meal would be far more acceptable to them, during the cold weather, than the hard, flint-like corn and hard-shelled oats that many feed. In our last article, we spoke of beans as the best grain for sheep, and stated that the use of them would "increase the quantity and quality"—of the wool, of course, we meant, not of the sheep. Much cruelty is inflicted upon lambs by leaving them for castration until they are two or three months old. The operation should be performed immediately after birth, removing the entire scrotum with a sharp knife. This, to some, may seem more cruel than the other, but we do not so consider it. Too many inferior sheep are kept by farmers. They are not profitable. It costs no more to winter a fine grade than a mongrel, and it is much more encouraging to remove from a sheep a fleece of seven or eight pounds than one of two or three. Some may say none but a fancy breeder can obtain this result. We can refer such to a farmer of this locality whose flock of fifty sheep *averaged* seven pounds to the fleece during the past year. They were fine sheep, however, and handled with consummate care.

We have a few acres of land that, for several years, has been bungled over and half worked, until it has become so poor we can think of only one crop to apply the coming season, namely, buckwheat. Where buckwheat will not grow there is no use sowing any other grain, yet, like other cereals, it does the best on good ground. The piece referred to is situated on the summit of a steep hill, making it, not impossible, but quite impracticable to enrich the land with barn-yard manure. We propose to seed thick with large clover, and clover alone. We shall probably get buckwheat enough to pay for plowing, and the clover will form a valuable coat of manure, the roots even of the growing plant serving to enrich the land. We think farmers make a mistake in sowing so much timothy seed. Nearly every one of our neighbors in seeding uses timothy alone. When asked their reason for so doing, they answer:—"We cannot sell our hay as well if our customers find clover in it; we know that it is injurious to the ground, but in order to sell our hay at anything like the usual price, we must sow timothy alone." Now, we cannot consider this the best of reasoning. Is it profitable to raise grass which we acknowledge is an unnecessary drain on the productive properties of our land, when it will only bring six and eight dollars per ton? Really, is it profitable to sell hay at all? Many claim that timothy possesses more nutriment than clover. Perhaps, bulk for bulk, it may, but then we cannot produce as much from the acre of the former as of the latter. Usually we sow eight quarts of timothy and four of clover. This gives hay of good quality for feeding, and our land is not impoverished by the crop. Some may dissent from the remark that timothy alone will steadily draw the richness of the soil until it is unfit for any crop. These have only to see the lands in this vicinity that have been "timothyed to death," to be convinced.

Fall plowing for oats is most essential. There is no grain, probably, so much affected by being sown on land turned in the fall, and left exposed to the action of frost, as this. They require early sowing, and by plowing in the fall this can be accomplished much sooner in the spring, than when left unplowed until seeding time. Our heavy, hill lands dry out much quicker, if this plan is followed. A few years ago we began plowing a field of six acres, going around the whole. The frost came too soon, and stopped our plowing for that fall, when we had only about one-third of the piece done. In the spring we commenced where we had left off, and finished the piece. The whole was harrowed once, with a sharp-toothed harrow, before sowing, and twice after sowing. Mark the result: The crop on the whole field was very abundant, yet that in the center, or on just so much as we had turned in the spring, lacked nearly a foot in hight at harvest, and was not nearly as well filled. We believe that we would lose nothing by plowing in fall, and crossing in spring. At least, a shovel-toothed cultivator should be applied before seeding. The seed-bed must be light and mellow, if we expect full remuneration for our labor. Whatever grain we raise, we must study the peculiarities of that particular grain, in order to be successful in its production. A neighbor has always calculated, every spring, to sow a certain number of acres, at all events; as a consequence, his farm is completely worn out.

Mr. COLE informs us that he has raised, the past year, fifty bushels more oats, from three acres, than he has ever raised on the same ground before. The reason he ascribes for this success is the fact that the ground was all subsoiled. No doubt, on heavy land this practice would prove most beneficial. A subsoil attachment has been used by some successfully, though we think the draft must be rather heavy for a light team. Many do not plow their land until seeding time, and then think they have no time for subsoiling, as it requires twice more time than the usual way. On some land it will pay to subsoil; on others the result would be doubtful; while, there is no doubt, that on others it would be pernicious.

REMOVING ROCKS FROM TILLED FIELDS.

There is not usually much profit in grubbing big stones and rocks from the farm; by which remark I mean to say that the profit lies rather in getting land where such work is not needed. But if a good farmer has a few such nuisances disfiguring his cultivated fields, by all means let him have them out as soon as he can. It will pay him a good percentage above the money return in the satisfaction of being able to plow and reap and mow without encountering these old-time enemies to good tillage. The work can be done at seasons when labor is cheapest and thus may be really almost no money expense. The hole which a deep-lying rock has occupied may be filled to within two feet of the surface with smaller stones, thus doing two good jobs at once. The digging and stirring of the soil around the rock required to move it, are also beneficial. I have often noticed that such places show the good effects on the crops for years after.

Miscellaneous.

THOSE TREE PEDDLERS.

S. B. PECK.

HAVING met with some vexations in purchasing vines and trees, I have thought that a relation of a few of the cases might be interesting, if not edifying, to some younger experimenters. My experience commences about thirty years ago, when I had only a single vine each of Isabella, White Sweetwater, and Clinton. An ablebodied man in a farmer's honest garb, appeared with grape vines to sell of greatly improved varieties, none other than the "Magnum Bonum and the Scotch Gray." The names being new to me, although I had read a good deal, excited my suspicions, and I took the precaution to take down his address, and to question him how these new varieties compared with the Isabella and Catawba, which he seemed to know all about. Well, they were a great deal larger, sweeter, and earlier, so I invested fifty cents for one of each variety. The second or third year they bore Isabella and Catawba grapes; and the next year there appeared at our town fair, many splendid specimens of Magnum Bonum and Scotch Grays, all of which failed to get a premium on account of their bogus names.

Years after, I purchased—not of a tree peddler, I was too wise for that—direct from a large nursery—now I think extinct—largely of fruit trees, grape vines and currant bushes. Of the latter were five varieties, all nicely bunched up and labeled. In planting them I was very particular, for I expected to propagate from them for sale. In due time they bore all the varieties named as near as I could tell; but instead of each kind being by itself as I planted them, the rows when the berries ripened, looked like variegated flowers. I had seen people shuffle cards, which I supposed was for the purpose of mixing them, and the first idea I had when these currants began to ripen was, that they had been shuffled.

In 1865 I planted thirty-five apple trees of nine varieties, selected out of a thousand from the same nursery. They were very carefully planted and recorded in a book, but up to this time they have not borne a single specimen of either of the varieties supposed to be planted. This is not the whole of my experience with a single nursery; there is much more of the same kind. There are other nurseries, too, where I believe the owners were and are honest; but they have been unfortunate in raising very obstinate trees that have utterly refused to bear such kinds as they ought to. I have bought several thousand fruit and ornamental trees and grape vines that were stone-dead when they reached me and others that were diseased and died gradually for years, without bearing. But, in justice to the fraternity of nurserymen, I must admit that there have been honorable exceptions. It is bad enough to plant and nurse a worthless tree, or to watch for years the development of a favorite variety, and meet with one which you do not desire; but I have been unwittingly a party to fraud, for many of the trees I have bought have been sold and paid for before the fraud was discovered.

SAND FARMING.

S. B. LOOMIS.

SAND FARMING depends upon how much sand there is. If pure sand, then follow the advice given in the Loudon Punch by DOUGLAS JERROLD to one about to get married, "Don't!" If properly mixed with vegetable matter, a modicum of clay, and sufficiently carbonized to give the soil a dark color, then for most crops in the latitude of Wisconsin, choose all the "law will allow" or your means permit, always remembering for *particular* crops.

Pure sand, or nearly so, is sought for in the valley of the Wisconsin River to raise watermelons upon, the crops, in ordinary seasons, being immense; netting to skillful salesmen and raisers from fifty to seventy-five dollars per acre; but this crop is an exceptional one, being a luxury rather than a necessity. In planting this crop there is no manure used, and as but few weeds will grow, the labor is only trifling; but no other remunerative crop can be raised upon the land.

The foundation crop on such sand land as it will pay to own, is clover and its necessary accompaniment, gypsum. This crop mown by the 10th of June, in this climate, and the second crop plowed down when part of the heads are filled with seed (the earliest formed), manures the soil sufficiently during the ensuing season for such crop as may be placed upon it. If the chinch bug is not troublesome, wheat will sometimes return a reward for labor expended, but corn will never fail to do so richly. Should wheat be chosen, the seed plowed under will be sufficient to give a good stand. Next year the process of mowing and plowing may be repeated, or if the soil be sufficiently fertile, the second crop may be saved for seed which upon sand soil will yield abundantly, never forgetting that where clover is there should be gypsum or land plaster.

Clover is always necessary as a pasture where the farmer raises hogs. Corn, here at the West is cheap, but clover is cheaper and better, being healthy food in the summer time. The past season I fenced off an acre and a-half of clover, and when just coming into bloom, placed in the inclosure thirty-one hogs half-grown and kept them upon the same without other food until some time in September. They grew, were contented and well prepared to appreciate the fattening process, quickly growing fit for the slaughter pen. A field of forty acres would carry a fabulous number and after that, such corn as the best acres can carry!

The most satisfactory results on sand soil are had here from clover, corn, and feeding these to swine, modified, of course, or controlled by the markets. This has been the result of experience. Still I apprehend that were wolves and curs destroyed, and sheep employed to feed down the clover in summer and consume the corn in winter, they would improve the land more and return as much and *cleaner* money, than the plan heretofore pursued.

A sand farm is not the best for dairying purposes, as the grasses adapted to permanent pastures delight in a cooler soil and one not so porous. Could the average farmer, however, bring himself to the soiling process and carry feed to his fold instead of driving his stock to the field, the sand farm would always equal, and in most seasons exceed the clay. The ease with which large crops of corn, clover, and particularly roots, are grown upon sandy soils would place them at an advantage—but while labor is dear and land cheap soiling will await the increase of population. The ease with which the soil is worked, coupled with the fact that none but the heaviest rains will stop the plow—which sometimes makes a difference of two weeks of time in the busiest season of the year as between sand and clay—these advantages, when both soils are to be sown to the cereals, will place the difference to the credit of the former.

Sand soils develop seeds with more uniformity than clay. The grass seeds will be in greater quantity, but the forage will be less; corn will have less stalk and leaves on sand, but will not want in grains; oats, barley, and wheat like clay soils best, still an average crop of these may always be expected from sandy soils and, some seasons, will be superior on the latter, but rarely. Farming on sand soils has not as wide a range as other soils will permit, but by keeping closely to the line indicated by both soil and climate, raising everything except wheat, to be consumed upon the land and carried off on the hoof or in wool, a competence can be had as pleasantly and with less labor than upon heavier soils and with more diversified industries.

SUNDRY TOPICS.

S. RUFUS MASON.

THE BIRD AND FRUIT QUESTION.

I NOTICE that Prof. BEAL gives his testimony against the birds. Thirty years ago there was but little complaint, while now amongst fruit growers there is a growing feeling that the birds take far more than their share of the fruit. I think the difficulty lies in the constant destruction of our forests. Formerly, insects found sufficient food and shelter among the trees of the forest; but as these are cut away, their feathered occupants are driven to orchards and fruit gardens, and possibly finding the new pastures more congenial to their taste, and as they are also less exposed to their enemies, they have increased beyond former precedent.

The birds, also driven to the orchards, have formed a predilection for fruits more than is natural to them. Thus the destruction of our forests causes both birds and insects to seek new haunts, and to become doubly destructive. The proposed plan or remedy (to destroy the birds), will only increase the evil; we shall then be totally given over to the rapacious insects. If the birds are removed, human computation is absolutely inadequate to number the insect increase after one generation. What would, in such a case, protect man himself from extinction within five years' time? Even now the birds are too few to be of much help in maintaining the balance of power. We have but two remedies: Either increase the number of birds or restore the forests, both slow in execution; but the latter the only possible means of accomplishing the former.

INSECTS ON THE FARM.

A vast, an unknown amount of loss is suffered every year by the depredations of insects. Many farmers, when they see a crop melting away before the attacks of these pests, are struck nerveless, and make no efforts of prevention. There is no part of creation that understands the "value of peace and quietness" so well as the predatory insects: being "let alone" is their life and main dependence.

It is a maxim in war, always do that to your enemy which he least desires and least expects. Constant disturbance of the soil or their haunts, prevents their increase, and makes their life uncomfortable. Here is the ounce of prevention, ready for use at once.

MAKING SPRING WHEAT.

I have read somewhere that winter wheat can be transformed into spring wheat, by sowing it in the spring for two or three seasons. If this is the case, then the Northwest can supply itself with new varieties at little cost. If any one has any experience in this line, I should be glad to hear from him through the RURAL, stating name of variety tried, soil, time of sowing, ripening, &c., &c. Seed wheat in this country, where threshing-machines travel from farm to farm, soon becomes badly mixed; but I think a new variety of real merit would induce our farmers to insist upon a thorough cleaning of the separator before use.

The Horseman.

HISTORY OF THE HORSE, Etc.

HAVING noticed, in a late issue of the RURAL, an article by GEO. GARDNER, describing what he saw in the horse region of Orange Co., N. Y., I wish the RURAL would tell us about the history of the horse, and especially of the Hambletonian strain.—H. H., *LaFayette Co., N. O.*

ANS.—Among modern physiologists, there exists no doubt but that all our contemporaneous breeds of horses are descended from an extinct perissodactyl mammal belonging to the solidungulate division or equidæ family, and in scientific nomenclature known by the name of HIPPARION. From an examination of the skeletons of this genus found in the later tertiary deposits of Europe, Asia, and America, the inference is inevitable that—— but we are really sorry that the modest space here at our command prevents us from complying with the very reasonable request of our correspondent by giving an exhaustive history of the equine race, and forces us to limit our remarks to a short notice of the Hambletonian breed. The original imported Hambletonian was foaled in 1791, and after his importation to this country, had varied success as a racer, but as a stallion became distinguished for the elegance and finish, as well as for the speed and endurance of his get, equally for the saddle, harness and trotting course.

Far more celebrated, however, among modern horsemen, is the Rysdyk Hambletonian, foaled on May 15, 1849, got by Abdallah, son of Membrino, by imported Messenger, and bred by JONAS SEELEY of Chester, Orange Co., N. Y. Abdallah, his sire, was out of Amizonia, of unknown blood. The dam was got by imported Bollfounder, second dam by Hambletonian, son of Messenger; third dam by Messenger; so that both sire and dam were rich in the highly-prized Messenger blood. The dam and foal, afterwards famous as Rysdyk's Hambletonian, were sold by Mr. SEELEY to WM. M. RYSDYK of Chester, for $125. At two years of age he was bred to four old mares, from which three foals were begot, one of which was ALEXANDER'S Abdallah, the sire of Goldsmith Maid. When three years old he was taken to Long Island, and after a test of a mile in 2.48, it was decided by his owner to use him as a stallion rather than on the trotting track. In this capacity he proved eminently profitable having, it is estimated, brought Mr. RYSDYK $100,000 during the twenty-five years he owned him, his services for some years being worth $10,000, the fee to insure a colt having been as high as $500 during the later years of his service. He was the sire of nearly 1,300 foals, of which 1,225 are known. No less than fifty-eight of his descendants have made records of 2 30, the most celebrated of which are Dexter and Goldsmith Maid. From the marvelous speed and endurance of so many of his progeny, he is undoubtedly entitled to be considered the great progenitor of trotting horses. He was a large horse, but without a particle of grossness. In color he was a rich mahogany bay, with a small star, two white ankles behind, dotted below the coronets with dark spots, and hoofs mainly dark. His head—according to an accurate description in a former issue of the RURAL—was large and bony; jowl deep; eyes large and prominent; ears large; neck short and heavy at the throat-latch, but thin and clean; shoulders very deep, oblique and strong; withers low and broad; back short, coupling excellent; croup high, and enormous length from point of hip to hock; legs broad, flat and clean, with tendons well detached from the bone; hock well bent rather than straight; the pasterns long and elastic; and hoofs splendid.

SHOEING HORSES.

IN shoeing horses, two methods are practiced here:—One is to pare the wall of the hoof only; the other, to pare the wall, and then with a drawing-knife to cut out the sole at each side of the frog until the shoer feels it yield under the pressure of the thumb. Which is the right way? or is either of them right?—*A. W. H.*

ANS.—The advisability of paring the sole of a horse preparatory to shoeing, is a question upon which very excellent veterinarian authorities differ. The practice is supported by such experts as YOUATT, MAYHEW, JENNINGS, WAGNER, MCCLURE, and FRANK FORRESTER, and reprobated by MURRAY, CLARK, LAFORCE, (one of the most eminent French veterinarians,) and many others. The former claim that in his natural state, the sole of the unshod horse would be worn down in traveling, and that, as its undue thickness is owing to the artificial protection afforded by man's handiwork, several evils resulting therefrom are best remedied by paring it down occasionally; the latter, on the other hand, insist that nature will get rid of any excess of horn, and that not a few of the ills from which horse-flesh suffers, are due to this pernicious practice. As it is an immemorial usage, there can be little doubt but that, when properly done, if not beneficial, it can, at any rate, be but very moderately hurtful; and that the chief objection to it is the abuses to which it is subject. Not a few farriers are equally ignorant of the principles of their art, and conceited with regard to their imaginary knowledge of the best methods of practicing it. These are the fellows who either pare down the sole until it yields under even a slight pressure, or are guilty of the brutality of cutting away until blood oozes through every pore in the structure; and all for no better reason than that some dolt as ignorant as themselves, had done so before them. To avoid some of the evils which this tribe, unchecked, are pretty sure to inflict on his animals, every horse-owner should bear in mind a few important points in connection with horse-shoeing, and firmly insist that due attention should be paid them by the horse-shoer. Briefly: never allow the frog to be touched with knife or rasp: if you do, it will soon become ragged, dry up, and shrivel and become a fruitful source of navicular and other diseases. Never allow the hoof to be rasped above the clinches, and as little as possible below. The outer covering of the hoof is exceptionally hard, and like the enamel of the teeth, acts as a protection to the softer and more porous inner part; injuring it, therefore, by ignorant rasping, is a frequent cause of dryness, brittleness, and sand-crack. Never allow an attempt to be made to shape the hoof to what the blacksmith may consider should be the right shape for the shoe; this should be fitted to the hoof, not the hoof to it. Never allow the bars to be cut at the sides for the purpose of "opening out the heels," as the effect is only temporary, and will inevitably result in weakening the bars and the ultimate contraction of the heels. Of these errors, for which many farriers have a partiality, the evil consequences are serious and more or less permanent; of their less noteworthy blunders, want of space prevents an enumeration just here.

Horticultural.

HOW FAR APART SHALL WE PLANT APPLE TREES?

PROF. W. J. BEAL.

THERE is a great difference of opinion on this subject. When the land is poor and thin the roots will be less numerous and must spread for long distances in every direction to get the nourishment needed. On poor soil it is very necessary to give the trees plenty of room. Our densest forests and thickest turf grow on soil which is very rich.

In planting an apple orchard, as in most other operations, it generally pays to do the work well. When properly taken care of, after twenty years, many varieties of apple trees will spread twenty feet in each direction, and some spread further as noticed in the orchard of Mr. BAILEY, a few weeks ago. The rapidity of growth and the longevity of the trees depend much on the soil and climate as well as on the variety of fruit. I have several orchards in mind in which the trees were planted closely together within fifteen or twenty feet of each other. Some of these were so planted because the owners had a theory that the trees would the better stand the rigors of severe cold winters and hot summers. One of the orchards was set twenty years ago on sandy land. The trees grew well for a few years, till they shaded all the ground. They were well cultivated but never bore very well. After shading the ground they began to run up for more air and more light. At present the orchard is of no value and never will be except for fire-wood. It was a poor investment,

chiefly because the trees were planted too near each other.

One of the other orchards was planted on good, rich land. The trees behaved much as in the previous case, though they bore good fruit in considerable quantity for some years, when they crowded, died or split down, and to-day, when only about twenty-eight years old, the orchard is of little value. On a neighboring farm with similar soil, another orchard was set at the same time. The latter has borne the most fruit and is still apparently good for many more years of profit to the owner.

In ordinary good loamy soil, or in poor light soil, the roots of an apple tree, when fifteen years old, extend at least twenty-five or twenty-eight feet in all directions. This is not a theory but a fact, as I have repeatedly seen the roots as described while putting in tile or while digging for the purpose of examining the roots. The feeders of the roots—the root-hairs—are renewed every few weeks during the growing season. The small roots from which the root-hairs grow are also often renewed. I mean these die, and others take their places or other places not far away. In this manner roots are all the time feeding on new ground. Doubtless, after a time, much ground is fed over again and again. Roots do not search for food as animals search for it, but they grow where they find the best soil and they will there multiply in the greatest abundance.

For long-lived trees and the best results, I am satisfied that large varieties of apple trees should not be planted nearer than forty feet, if they are set in squares. This gives not a whit too much air and light for the tops and, as has been shown, the roots will soon occupy all the ground and make good use of it. While the apple trees are young, if desired, other crops may occupy the intervening spaces. I prefer to set trees in squares because it is the simplest plan, and because it is easier for the cultivation. As mentioned, the roots will run all through the soil, even crossing one another at long distances between two trees.

If the trees are of varieties which do not grow fast or become large, they may be planted nearer together than forty feet. If, like the Wagener, they begin to bear young and are allowed to bear and get ready to die by the time they are fifteen years old, they may be planted only twenty or twenty-five feet apart. Trees are often injured by planting too closely, seldom by having too much room. One tree does not protect another by growing very near it. On the contrary, one robs the other. Our strongest, finest ornamental and forest trees grow in open spaces where there is plenty of room and where the soil and climate are suited to their natures.

PEAR TREES AS OBLIQUE CORDONS.

Gen. H. W. Sargent, at Fishkill Landing, N. Y., has a large number of these cordons bordering the quarters of his kitchen garden. In this way an immense variety in a small space is under complete control as regards pruning, disbudding, thinning the fruit, &c. The General remarks:—"It is not quantity, but quality I want. During the pear season there is an abundance of other fruits, so that I can afford to grow but a few pears on each tree, and have them of the very best quality."

As many of your readers may be unacquainted with "cordon training," I will endeavor to explain. In the United States our excellent sunny summers ripen the fruits on standard trees so thoroughly and satisfactorily, that artificial training of the trees for a maturing end, is seldom needed and not often practiced; but nevertheless, such training has its advantages. Well then, oblique cordons are trees of one stem trained at an angle of 55° to 75°—as suits the grower—to a trellis, as is often done with grape vines. The trees are planted eighteen to thirty-six inches apart, the one leaning, as it were, over the other thus—////.

Thus it will be seen, a great many kinds, if required, may be grown in one row, and they are as much under command as a currant bush or grape vine would be. If all the fruits they "set" were allowed to ripen, the trees would soon be ruined and the principle of the system abused; only a few—say one to six, according to the size and strength of the tree, should be permitted to remain to mature, and depend upon it, those will be fine. To take any sort of a pear tree and make a cordon out of it, would be buying experience dearly—at the loss of time, care of tree, and the misery of disappointment in the bargain. I would advise those who wish to try the system, to purchase one-year-old trees for oblique cordons directly from some responsible nurseryman, and see that you get strong, healthy, well-rooted plants.

Plant them at your chosen distance, cut back the stem for one-third or one-half its length, to a plump wood-bud facing front, and tie the stumps in position. Several shoots will start into growth, but as soon as they grow four to five buds long, shorten them all (but the top one, and that don't touch,) to the third joint; and if they grow again from these lateral spurs, shorten again to one leaf, and if necessary, pinch the point of the main or top shoot. In September, cut back the end shoot to one-half or two-thirds its length, and finish whatever pruning is necessary on the spurs. Proceed in this way till the desired hight is attained, then cut over the end shoot and cast all vigor into the fruit-spurs. Never allow a side-shoot to grow.

In after years, instead of continuing this "fore-shortening," "disbudding" will be mostly resorted to; that is, when sufficient fruit-spurs are secured, instead of pinching, as in earlier years, the shoots had better be rubbed off when they grow about an inch long.

Cordons are most applicable to amateurs who are interested in fruit trees, and who have only a small town lot or suburban garden in which to develop their hobby. This system is much practiced in France and Britain. W. F.

Floricultural.

BULBS FOR THE FLOWER GARDEN.

W. C. L. DREW.

CYCLOBOTHERA.

The Cyclobotheras are new introductions among the bulbous plants, which, for genuine beauty, leaving out the question of fragrance, have no superiors among that class of plants.

They are natives of the State of California where among the foot-hills of the Sierra Nevada, they grow in the greatest luxuriance. When in bloom, none of our many wild flowers are so highly prized as the chaste Cyclobothera, and none are so easily gathered by the exulting botanist or frolicksome child.

The bulb, which is small in all the varieties, is in form and outline like those of the Tulips; the neck is very fine and small, swelling towards the center, where at its greatest circumference, it is from a quarter to a half an inch in diameter, varying in depth from three-quarters of an inch to an inch. The bulbs, although so small, are always found very deep in the ground, never less than four inches, but often eight to ten inches, at which depth they flourish the best. As the varieties differ considerably, it will be necessary to describe each separately.

Cyclobothera elegans is a variety more abundant than any others. It grows from six to ten inches high; the leaves are of a dark, metallic green color, averaging in length one foot. Each bulb produces from three to eight cup-shaped flowers, the perianth being composed of three large petal-like, and three smaller sepal-like appendages, the larger ones being thickly covered with short hairs which give them a velvety appearance. In color, the flower is bright, shining yellow throughout, being one of the most intense yellows I have ever beheld in the floral world. It grows in common soil, doing best in slight shade. It flowers from April to June, coming earlier than Snowdrops and lasting much longer.

Cyclobothera alba is the gem of the family. It grows from one and a half to three feet high, the leaves are a bright shining green, from one to three feet long. The flowers are produced along the stem, each of the latter producing from four to twelve blossoms. The flowers are in shape like those of C. elegans, but instead of being erect as in that variety, they are of a drooping habit, like those of the Crown Imperial, which they resemble. In color, they are pure, pearly white. They are about one inch long and the same in diameter at the mouth. They grow always in the shade of trees, liking moist, rich soil in which they luxuriate. If I could have only one choice between these and the royal Hyacinth, I would take Cyclobothera alba three to one. Can I give it higher praise? Flowers from May to July.

Cyclobothera purpurea has similar flowers to C. alba, but in color, while of a pure white on the outside, they are purplish within, otherwise it resembles alba.

C. pulchella is a scarce variety, resembling C. elegans. In color the flowers are delicate cream. It grows one foot high.

C. rubra is the least known of all varieties; it is very scarce; color, a clear rose tinge throughout. It grows one and a half feet high. A charming variety only to be seen to be coveted.

If you want a flower for bouquets, for garden decoration, for lawn decoration, for vase, or for cemetery purposes, try the Cyclobotheras.

WORMS IN FLOWER POTS.

WILLIAM FALCONER.

Earth-worms do frightful mischief in flower-pots. They turn the soil out or break the roots, deposit humus in impermeable and sour masses, clog the drainage, and thus prevent a healthy percolation and ready escape of water. Their presence is easily detected by the upraised excrements on the surface of the soil, by which can be known whether the worms be big or little fellows. If they be big worms, I would water the plants—that is the soil in the pots—in the morning, and in the afternoon turn it out of the pot, preserving the ball intact; most likely the worm will be visible on the outside when it should be firmly caught hold of and pulled out slowly. If it be done with a jerk you are likely to break the worm, for as soon as it feels itself caught it pulls back. A better way perhaps is, after watering the plants, to tap the pots on a table, bench, or anything else that is solid till the intruders come to the surface to reconnoitre, which they will soon do. Don't clutch at the worm immediately you see it, else it may give you its head but retreat with its body; but let it get half way out and then catch it.

A little lime-water applied now and again to the soil, makes the depredators uneasy and leave, but in the case of Camellias, Rhododendrons and some other evergreens, lime is almost as destructive to plants as to worms. A little soot-water answers the same purpose and is not objectionable to most plants but, on the contrary, it acts as a stimulant.

If the earth in the pots be so perforated and the drainage clogged, as to render the mass unhealthy, it is best to turn the plants out of the pots, remove the worms and a goodly portion of the sour earth, and re-pot, using a comparatively small but clean and well-drained pot. Flower-pots containing plants, stood on the ground out of doors, are a certain trap for worms. Pots should always have a piece of slate or wood, some coal ashes, or other preventive of ingress, right under them. Worms are also often introduced in the soil to the pots, particularly so in the case of manure or leaf soil; therefore, in re-potting your plants, be careful to pick out and discard every living creature you find in the earth you are about to use.

Arboricultural.

A FEW CHOICE EVERGREENS.

SAMUEL PARSONS.

The depth of winter would seem hardly a suitable time for selecting evergreens; but the appearance of the lawn owes, at this season, so much to evergreens and there is so much leisure now to look up the matter that we feel inclined to briefly call attention to the subject. Of course, the solid frame-work of lawn groupings must be constructed from the cheaper, more rapid growing and massive pines and spruces. These, arranged in belts, the individuals of which fill up the vacant spaces of either row in alternate fashion, will serve to shelter from winds, protect more precious plantations, and early give character and effect to landscape viewed as a whole. All this is, however, generally studied in constructing any well arranged lawn. The evergreens which we wish to notice just now, possess a more marked individuality and lasting nature. They neither lose their beauty in a few years, nor occupy after a time so much space on the lawn as to make them relatively monstrosities. Many such varieties may be selected of decided beauty and value, but it will be found after all that but two or three varieties of each species really possess the desired qualifications. Nor would we embrace every well-known species of evergreen in this selection, for neither the Yew nor the Chinese Arbor Vitæ fall quite within our category.

Experience, thus far, decidedly indicates the Conical spruce as entitled to the highest rank among popular evergreens. And it has become popular not from an extreme pre-eminence in beauty, but from the possession of a high average of useful and attractive qualities. Every one, moreover, knows the Norway spruce and values it; the Conical spruce, therefore, independent of its own intrinsic value, obtains a certain favor at once from its being simply a symmetrical Norway spruce of dwarf, permanent habit. The Weeping spruce is quite as valuable a tree as the Conical spruce, and is only less popular, because less familiar in its forms, which also, though picturesque and graceful, fail in that charm possessed by perfect symmetry for the popular eye. These forms, however, weeping and hugging the stem in the most irregular masses, must always constitute it one of the best of drooping evergreens.

The Oriental spruce is the very best of all spruces, if people did but know it. Unfortunately while young, it resembles the Norway, lacking somewhat of that spruce's early vigor. As age increases, it develops more rapidly, and finally in no great time towers into a solid mass of dark, lustrous foliage possessing a very peculiar beauty and marked character on the lawn. It is, moreover, extremely enduring and hardy.

While the spruce is perhaps the most invariably enduring of evergreens, the Piceas or Silver Firs excel all in beauty. For solid grandeur, and unfailing attraction the Nordman's Silver Fir is almost without a peer. Very symmetrical, with shining dark-green foliage, revealing light-blue shades on the under sides of the leaves, it wants but one quality to render it the finest of evergreens, and that is the power of retaining unaided a general shapeliness through life. The central leader will push up with a rapidity that is apt to destroy a proper and well filled base. An occasional pruning of the rampant leader will, however, curb this injurious tendency.

The Weeping Silver Fir is not as picturesque in its forms as the Weeping spruce, because it is rounder and more compact, but much surpasses it in perfect curves and shining rich foliage.

The Dwarf Silver Fir is the hardiest of a species the other members of which scarcely equal in hardiness those of the spruce family. Its compact form and rich foliage are also most attractive.

The Retinosporas, not long fairly introduced to America, are worthy of very particular attention. Their forms and colors are most varied and their fern-like grace is unsurpassed. Quite hardy and of compact habit, it is strange they are not better known. Chief among them are pisifera and obtusa. One, termed plumosa aurea, (said, however, to be simply a form of pisifera), has great value for its rich golden hue retained and even deepened throughout the fall and winter. The queen of all evergreens is the Weeping Hemlock. Its graceful sprays have a permanent beauty that we only see equaled, in a fleeting way, by some stray form of common hemlock. Not less striking, in its way, is the broad-leaved Hemlock, the dark, massive foliage of which contrasts finely with the Golden Retinospora.

These meager notes are not intended to indicate by any means a complete list of desirable evergreens, but only such as no lawn can afford to be without. It is to be hoped that the taste for acquiring full collections of fine evergreens may continue to grow in the future as it has in the recent past. We may then expect to eventually see even the humblest homes intelligently decorated with trim, graceful evergreens properly adapted by nature to the size and character of their surroundings. Few realize the attraction that might in this way be lent to many a place now forlorn with ragged spruces and pines, and unkempt flowering shrubs.

PAMPHLETS &c. RECEIVED.

Mr. T. C. Evans, Boston, Mass., has issued his hand-book for 1878. It is very attractively gotten up, the list appears conveniently arranged, and the press work so neat that it must prove of great benefit as a reference book. Mr. Evans' long and successful experience as an advertising agent has been utilized in the book before us, and we cordially recommend it to advertisers seeking trustworthy mediums.

Union Meeting of Farmers.—Arrangements are in progress for a general agricultural meeting on Wednesday and Thursday Jan. 30 and 31 at the City Hall, Manchester, N. H.

The design of the originators of the meeting is to include all horticultural and agricultural organization in the State, Granges, Farmers' Clubs, Town and Local Associations, County and State Societies, the Board of Agriculture, and the Agricultural College.

W. W. Sharpe & Co's. Catalogue of newspapers, magazines, &c. The fifty-five pages of well arranged lists of periodicals between the covers of this hand-book embrace about all the information an advertiser can reasonably ask for. In view of such books as the one under notice, it would seem strange that a business man could spend money in advertising injudiciously. As to the firm, a long and pleasant business experience enables us to indorse them heartily. They are as courteous as their estimates are reasonable, and if they err, it is on the side of generosity.

E. C. Williams the recording secretary of the New Jersey State Hort. Society informs us that the Third Annual Meeting will be held in Geological Hall, New Brunswick, Feb. 6th and 7th, at 10 o'clock, A. M. The following subjects have been proposed for discussion:

Pear culture, in its present condition as a profitable pursuit; Pear blight, results of another season's observation; Raspberry culture, best methods and varieties; Tree planting, for shelter and the roadside, and best trees for the purpose; Our small birds, is their destruction justifiable; Peach culture, and best varieties for New Jersey; Our native nuts, their cultivation and commercial value; Upland cranberries, has their cultivation proved profitable; Old-fashioned flowers.

All who are in any way interested—if only to the extent of a city lot—are cordially invited to be present and take part in the proceedings.

Domestic Economy.

CONDUCTED BY EMILY MAPLE

PITHS.

Never use a fine comb.

Apply lemon juice to corns.

Hellebore will kill roaches.

Never eat too much—never go hungry.

Carpets having small figures are fashionable.

Kitchen floors, when oiled, will not show grease.

May-weed blossoms put into alcohol make a superior liniment.

The sick-room should be the lightest and brightest in the house.

Pure orris-root powder is a harmless and agreeable tooth-powder.

Raisins are rendered quite digestible if boiled or steamed before using them in cakes or pies.

A delicious sirup is made by melting one pound of maple sugar with two pounds of white sugar.

To sweeten the breath, pour a few drops of tincture of myrrh into a wine-glass of water and gargle the mouth thoroughly with it.

An Idea for Mothers: Baste a piece of needle-work on the bottom of children's cloaks; this takes the place of a white dress in the street, and is far more easy to do up.

SIFTINGS FROM THE KITCHEN FIRE.

ANNIE L. JACK.

THE SUNDAY DINNER.

The "Kitchen Club" held its meetings at our house yesterday. It is an informal gathering to talk over domestic matters, and is dubbed "*kitchen*" because no fancy work, or anything outside of the real work of everyday life is allowed in its discussions. "Thoroughly practical" is our motto. Sometimes we take for our subject the troubles of the kitchen fire, and plans for preventing smoke, or bad regulating. At other times the various ways of preparing our simplest meals. This week, the subject was Sunday dinners, and there was such a variety of opinion that the summing up was as hard as it would be to pick out the prettiest pattern in a patch-work quilt, made of a traveler's samples.

Mrs. John Jessup advocated that as Sunday was a day of rest, cooking should not be done on that day. Cold pork and beans, with plenty of pie, were good enough for any Christian. Mrs. Ronald Rutherford went to the other extreme and stated that as the Sabbath was a day of rest from labor and from play, both husband and children had more time to digest a good dinner than on any other day in the week. With our good cooking conveniences, no one need be kept from church to prepare the dinner, if the fire was kept up by the person remaining in charge of the house; a good joint would cook partly through, to be basted and finished off while the vegetables were boiling. There was nothing pleasanter than a good warm dinner in cold weather, when the family can gather together with leisure to eat it, and quietly enjoy each other's society, without any of the haste of every-day life.

"But," spoke up little Mrs. Lennox, "we are as busy on Sunday as any other day; what with Sunday-school and the two services, and prayer-meeting afterwards, we see less of our family than on any other day." Then Delia Dewell rose and gave her opinion. "I am an old maid, I suppose," said she, "and not supposed to know much about such matters. But I often think when I see the hurry of the Lord's Day in many families, even though it be crowding in a *good* cause, that we cannot, as a people, lay off our restless hurry and enjoy the day as we ought."

It had been settled at the last meeting that I should give on paper, details of a good, warm, easily-prepared dinner, which could do away with the cold pork and beans of Saturday, and yet take only as long to finish after church as is usually allowed for table-setting, and other small, but necessary preparations. So I give my readers the benefit of the bill of fare, merely stating that the *pudding* recipe was given by me to the "Dining-room Magazine," nearly two years ago.

My ideas read as follows: "Take a good roast of beef, sirloin is best; pour over it a cup of boiling water when placing into the oven, which will check the escape of the juices if your oven is really *hot* as it should be. If the fire is kept even and a quarter of an hour allowed to the pound, you will know how early to put it in. Half an hour before the time for dinner, put on your potatoes, which are none the worse if peeled the night before, or early in the morning; and allow five minutes less if you boil a Hubbard squash, which, however, is very sweet and wholesome when *baked* slowly in the oven all morning. Served with good pickles, horse-radish, or other condiment this forms a very good, substantial dinner, with cheese and apples and our favorite pudding.

Put into a deep dish enough apple sauce (or if none is at hand, a jar of canned fruit) to fill it about half full. Make a batter of flour with a little baking powder and salt, and as much cream slightly sour as will make it rather stiff. Beat smooth, and pour over the fruit. It will bake while the potatoes are cooking, and it is extra nice in summer when fresh fruit can be used, although apple sauce will be found very palatable." Such was the plain dinner submitted to the "Kitchen Club," and approved by them. It has been tried many times in our own house, with economy in time and trouble.

All these things, my fellow *Domestic Economists*, are of vastly more importance to our happiness than many of the small *nearnesses* we are apt to call by that name; and I found from the opinions of the "Club" that no subject calls forth such opposite opinions as the regulation of The Sunday Dinner.

CRYSTALLIZING GRASSES.

Dissolve one and one-fourth pounds of alum in one quart of water by heating and stirring, set off until cooled to "blood-heat," then dip in a small handful of grass, for a moment and take out; if not quite as you would like, dip again. If the solution should be a little too warm when you begin, it will soon cool. It must be watched closely, as one ought to be able to dip three or four bunches of grass before reheating the solution. Heat as many times as desired and let each succeeding bunch remain a few moments longer at each dipping, as the alum decreases.

After obtaining all the white crystals you care for, add a very little indigo or other coloring material, that you may have a variety of colors. After all this, one can add more water and heat the mixture, then drain through a cloth, and use for children's stocking yarn or carpet rags, if you wish to color red, and do not wish to throw away the alum. Some grasses are much prettier for crystalizing than others, but this can be told by experience only. If I know the names of the many wild grasses of our State, which I think are more interestingly beautiful than those I have seen in any other State, I could tell what kind are best for that purpose. I, however, reject "timothy"—not wild—wheat, and the wild grasses which resemble wheat, and do not often try oats. There are several kinds which resemble Briza maxima, some of the largest of which are exceedingly lovely crystalized, while the smaller ones are marvels of beauty when colored and mixed with the former. Grasses should always be well dried beforehand, for this purpose, and all the blades removed at the time of picking, as one will break many stems if left until dry.

Dairy Husbandry.

AMERICAN DAIRYMEN'S ASSOCIATION. THIRTEENTH ANNUAL CONVENTION.

BUTTER AND CHEESE.

Cleveland, Jan. 8-10, 1878.

The Thirteenth Annual Convention of the American Dairymen's Association was held at Cleveland, Ohio, January 8, 9, and 10, in connection with the Ohio and Western Reserve Associations. It was admitted, on all hands, to have been the best meeting of the kind ever held in this country. There was an unusual amount of scientific knowledge as well as practical experience and business energy embodied in the men who took active part in the proceedings. The only noticeable defect in the convention was in the comparative smallness of the number of dairy *farmers*, as compared with that of cheese and butter makers and those engaged in the dairy trade.

It was a sad mistake of the farmers who stayed at home, on the supposition that the discussions and addresses would be but of little interest to them; whereas, in fact, much of what was said was designed for their especial benefit—and nearly all the topics were such as they ought to be more familiar with. It is such neglecting of opportunities for gaining information that keeps farmers perpetually in the background.

BUTTER VS. OLEOMARGARINE.

This was one of the first and most interesting topics discussed. Mr. Reader, a member of the Pennsylvania State Board of Agriculture, commenced the discussion, speaking of the growing magnitude of the manufacture and sale of oleomargarine, and of the effects of the sale of the spurious butter in depreciating the price of genuine, and the difficulty, on the part of common people, in distinguishing between them. He read extracts from of. Arnold and Dr. Mott, showing that these two articles differed somewhat in their chemical ingredients, and especially in the essential oils which gave flavor; though prominent physicians had pronounced the oleomargarine a healthful article of diet. He thought the main question was, "What shall we do to protect ourselves, as dairymen, from this form of competition?" As far as he was concerned, he was willing that each article should stand on its own merits, only protecting the consumers from deception in the matter.

The next speaker was Dr. H. A. Mott, Jr., of New York. He said he was not in any way connected with either of the manufacturing establishments of oleomargarine, though he had had much to do in perfecting the methods and apparatus for the patentees of the invention. He then went on in defense of oleomargarine, showing from chemical analyses, that the fat of steers from which it is made, is essentially the same as that in milk or butter; and that when the manufacture is rightly conducted, the product is as pure and wholesome as dairy butter, and as acceptable to the taste of the majority of consumers—even more so than the average quality of the butter sold in our cities—and it could be afforded at half the average price. Hence, he could not see why there should be any popular outcry against the article as an imposition on the public.

He claimed that the nicest chemical analyses had shown that the kinds of oils or fats in butter made from milk were all found in the fat of beef; but there was probably some difference in their proportions which analyses had not yet explained. He said the export demand for our beef was lessening the supply of dairy butter, and consequently the price of this product was becoming too high for the mass of our city people to buy; and now this new article was stepping in to supply the demand, and the people were showing their willingness to accept it; hence dairymen might as well make up their minds to endure the competition, and perhaps it will be as well for some of the dairy farmers to give their attention to raising beef cattle, instead of killing off all their calves. He said the New York and New Jersey Companies had used over eight million pounds of fat up to March 3, 1877, and in the year 1876-7 they sold in one contract 3,295,000 pounds of the artificial butter. In 1877 contracts were offered to them but not accepted, for 3,000,000 pounds annually for five years; and large offers are now pending.

LEGISLATIVE ACTION.—OLEOMARGARINE.

At a subsequent stage of the proceedings Mr. R. P. Cannon, President of the Ohio Dairymen's Association, made a motion that the dairymen of Ohio petition the legislature of that State to pass a law similar to that recently enacted in New York, and that is also asked for in Pennsylvania, requiring the manufacturers and dealers in Oleomargarine to so mark of brand the packages containing this article, that purchasers and consumers can know what they are getting—and to impose a fine on those who may sell the artificial compound as dairy-butter. This gave rise to quite a lively debate. Professor Arnold had no objection to the proposition on the part of the Ohio dairymen, but hoped it would not be regarded as the action of the American Association. Mr. Straight and others of Ohio said they were quite willing the spurious butter should come into fair competition with the genuine, and they believed it would have the effect of stimulating the dairy butter-makers to furnish a better quality for the markets; but they wished to have every tub stand on its own bottom, and they knew that at present much of the spurious article was palmed off as genuine butter, and prices of the latter were thereby reduced. Dr. Mott said the manufacturers only complained of such legislative action because it was calculated to create public prejudice against their product. They were quite willing the article should stand on its own merits, as it could certainly do. They would only ask as an act of fairness, that in the passage of such laws as proposed, a clause should be appended preventing the dealers in poor dairy butter from labelling it Oleomargarine.

The motion asking for action on the part of the Ohio legislature was passed by a large vote. It was stated that a company with large capital is about starting a manufactory of Oleomargarine at Cleveland, and also at Cincinnati.

PROSPECTS OF THE DAIRY TRADE.

Mr. J. H. Reall, well known as a leading butter and cheese dealer of New York, gave an excellent address on the past, present and future of the butter and cheese trade. It was quite hopeful in tone as to the future of the dairy business in this country, but reflected severely upon the course of many of the cheese-makers, especially of Ohio, in that they had lowered the standard of quality of their cheese for the sake of a little temporary gain, by resorting to skimming the milk so generally for butter, then making a second-rate cheese, not suited for the foreign markets, and at the same time discouraging home consumption. He urged the cheese-makers to skim less, or none at all, and also to use all the best appliances and knowledge for the purpose of improving the quality of their cheese. He said there was a gradual increase of the foreign demad for good cheese, and he was sure the home consumption would also increase if a good and wholesome article was generally furnished. He said "If consumers of all classes understood that cheese at any price under double the cost of meat, was a third the cheaper while much more wholesome and nutritious, treble the quantity would be used in this country. Unfortunately, through avarice, we have always given the most inferior cheese we produce to the home trade, going so far as to practice this short-sighted policy with the very people who furnish milk from which the cheese is made—hence it is only from sheer compulsion that our own nation eat any cheese at all. If we gave them the best, which, by the way, the foreign consumer gets as cheaply as our own people do the rejections, we should soon have such a demand for cheese in America, that we should not depend so largely upon the foreign trade for a market. Our people like fine, full-cream cheese as well as do our English cousins, and they should no longer be put off with skimmed and half-skimmed goods. If we give them a fine article, they will soon learn that cheese is a most digestible food, and that it is a want of quality which makes the kind they have been used to eating, lie like grindstones upon their stomachs."

OLEOMARGARINE CHEESE.

Of the new process of making cheese by skimming off all the cream, and substituting a little beef fat, Mr. Reall said it was the invention of Mr. Henry O. Freeman, hence called Freeman's Process. The milk is set in the usual way, where creamery butter is made, at about fifty degrees temperature, and held from twenty-four to thirty-six hours, when it is skimmed, heated to a temperature of ninety-two degrees, and sweet, clean beef suet raised to the same temperature is substituted for the cream, and sufficient rennet is used to cause coagulation in from ten to twelve minutes. Every particle of the cream is taken from the milk, that it is possible to obtain, and the fat is used to enrich the then almost useless curd. The product is a good, wholesome article of food, and I regard the process as one of great value to the public, since a larger supply of fine butter is imperatively needed, while the milk would otherwise be worthless, for when made into cheese it has only a commercial value of from two to four cents per pound, and none as food. It is by this process converted into a palatable and nutritious cheese, worth double to quadruple the price it would otherwise command. The product meets with favor both in this country and in Europe, but is mainly exported. As there is no adulteration or deception practiced, I approve the system, and favor radical skimming, if skimming must be done, but I give the preference at all times to full-cream cheese. The owners of this process do not claim to make as good an article as fine, full-cream cheese, but to greatly enhance the value of skimmed milk."

CREAMERY VS. DAIRY BUTTER.

After speaking of the low prices of butter during the past season and the reasons therefor, Mr. Reall said we must produce more fine butter and market it while fresh, and by increased attention to winter dairying, which has proven the most profitable branch, be prepared to supply it fresh at all seasons of the year. The preference for fresh butter has become so great that in the winter, when the stock cannot be had sufficient for all, the masses take into made butter, however characterless, in preference to the finest early made New York dairies, which formerly commanded much the highest price, in winter, of any kind. The time when New York dairy butter would bring from five to fifteen cents per pound more in the winter than in the summer when made, has gone by, and instead of yielding a profit by holding it, generally produces a loss. The time to market butter, therefore, has come to be when it is fresh.

The creamery system of making butter must supplant the dairy plan to a very large extent, and the result will be a great saving in waste and labor to the milk producer, besides yielding him a larger return.

The price of creamery butter last year will probably average thirty cents per pound; New York dairy, say twenty cents, and all dairy not over fifteen cents; for the poor farmer of the far Western States only realized ten to twelve cents for his product throughout the summer. It will thus be seen that there is a large difference in prices in favor of creamery butter; but, beyond all this, is the fact that all classes of our people should have the opportunity to obtain first-class food of all kinds at reasonable prices.

On the subject of churning the entire milk instead of cream only, Dr. Mott quoted the opinions of several authorities in its favor, but admitted there was need of more facts as results of actual experience. He said:—"In my opinion, the views advanced are at best only theoretical, as they are not based on actual trial. I

do not find recorded any statements against churning the whole milk, except by persons who have never practiced it; but on the contrary, by those who have experimented, all agree that the yield of butter is greater and the flavor and odor far superior to butter made by other methods. I fully agree with Mr. Curtis, who says that more experiments ought to be made with churning the whole milk, for from a scientific standpoint I believe it will be found that the whole milk churning will produce a butter having an odor and flavor far superior to butter churned from cream, other things being equal.

ON TEMPERATURE IN THE DAIRY.

This was the topic of an instructive essay by Prof. Caldwell of Cornell University. After giving the lessons of science and results of experiments, his most practical conclusion was, that in setting milk for cream, it should be cooled as quickly as possible to a low temperature—say 36° to 40°, or near to freezing. So far as the results of experiments go, they show very plainly the separation of the cream is more rapid and complete at low temperatures, in the region of 40°, than higher. A French chemist, as the results of numerous experiments, found that when the milk was quickly cooled to 36° in small vessels, almost the entire cream was separated in one hour; but in a vessel of forty quarts, it took twelve hours to effect as complete separation, while at the temperature of 66°, it required thirty-six hours to effect the same with the same quantity of milk. Nothing was gained in the amount of cream by letting the milk stand longer than twelve hours at the low temperature. Prof. C. approved the plan of setting milk in metallic vessels placed in a bath of cold water and not resting on the bottom, but so that the cooling should affect the bottom more than the top; for if the cooling proceeds fastest at the top, it creates a downward current of the milk which hinders the rising of the cream.

On the subject of testing milk with a view to the detection of any adulteration with water, Prof. Caldwell and others said no easy method had yet been devised, except by the use of the little instrument called the lactometer, and this is not in all respects satisfactory. The average specific gravity of pure new milk is 1 029 by the instrument—water being 1.000; but cream being lighter than milk, it follows that milk which is very rich in cream, will show by the instrument the same as milk that has been slightly watered, and skim-milk mixed with water may be of the same specific gravity as new milk.

ON FEEDING COWS FOR MILK.

"Milk Production" was the topic of an excellent address by Prof. Stewart, editor of the Live Stock Journal. He regarded the cow as a machine for making milk, just as a steam-engine is a machine for producing power; and it is as vain to expect the cow to give milk without sufficient food of the right kind, as to expect the steam-engine to afford power without sufficient fuel and water; but people are all the time vainly trying to make something from nothing! It is vain to give a steam-engine only enough fuel to keep the water warm; and so it is to give a cow only enough food to keep her from starving or freezing. If milk is desired, she must have a surplus of food beyond the other wants of the system, or all the rest is a loss. About two-thirds of all an animal eats, is needed to maintain its existence; all the profit comes from the other one-third, and this is often withheld entirely. He advised soiling cows with green food during dry times in summer, commending for this purpose a mixture of peas and oats, cut when both are green; also Hungarian grass and sowed corn, and more use of roots for winter, where the soil will permit. He did not approve of corn meal alone or with corn fodder for cows; would prefer at least part bran or middlings, the latter having a good share of the albuminoids, while the corn is mostly carbon. Corn and oats ground together, is excellent for cows. He did not think it paid to cook food for cows unless a large number are to be fed; but in feeding a large herd with a good deal of corn fodder, he found it of great advantage to cut the stalks finely by steam power, then mix with meal and bran, and steam the whole. All is done with the use of very little manual labor.

Mr. Bateham of Ohio, said this method of feeding was exemplified on a large scale by Hon. A. C. Wales of Massilon, who feeds annually about 1,000 sheep and fifty or more cattle and horses, without any hay; but grows from fifty to seventy acres of sowed corn, and uses his straw by cutting and steaming the whole, after adding meal or bran, and finds it cheaper and better than feeding with hay. Mr. B. advised farmers who were interested, to go and inspect the machinery and methods of Mr. Wales. Mr. W. had offered to contract to feed several hundred dairy cows through the winter, and have them in first-rate order in the spring, for $8 per head, if time was given for him to grow the fodder.

"WHAT LACK I YET?"

was the suggestive title of an able address by Hon. H. Lewis of Herkimer County. He urged every dairy farmer and manager to ask himself this question, and make all possible efforts to discover the answer, then attain the thing lacking, whether it be in himself or in external appliances for his profession. Most of the hints given in the line of needed improvements are such as are familiar to the readers of agricultural papers, hence need not be repeated here.

SALT FOR THE DAIRY

was the subject of a spirited speech from Mr. F. D. Moulton "Our Mutual Friend" of New York, who is agent for the sale of the Ashton English dairy salt, the superiority of which he set forth in eloquent terms, and backed up his arguments with numerous certificates from American dairy firms. It was then urged that as an act of comity in return for the large amount of our dairy products imported into England without duty, the duty imposed by this country on English salt ought to be repealed; and accordingly a resolution to that effect was adopted by the convention.

Prof. Englehart of Syracuse then followed with a scientific essay on salt and its uses, and showed by chemical analyses that the Onondaga dairy salt is the purest known in the trade, and he also gave a number of testimonials in its favor, as being equal to any imported. So the salt question remains unsettled; the convention favoring free trade and free opinions.

PASTURE LAND AND GRASSES.

Dr. N. S. Townsend of the Ohio Agricultural College, had been appointed to adress the convention on this subject, but being unable to be present he sent a brief letter, setting forth the importance of improvement in this direction; to increase the fertility of dairy pastures by plowing, manuring and draining, and then seeding with a variety of grasses, instead of timothy alone as is the common practice, leaving other varieties to come in with the weeds.

Mr. M. B. Bateham of Painesville being invited to speak on this subject, said he had inspected many of the dairy pastures in different counties of the Western Reserve the past summer, and he found that most of them were fast declining in productiveness so that without a radical change on the part of the dairy farmers they would soon fail of support and the foundation of this whole business would be giving way. He said the assessors' returns of the dairy counties in Northeastern Ohio showed a decline in the productive capacity of pasture lands amounting to one-third or more, the past ten years; and on account of this decline dairy farming was becoming unprofitable. He said the lands were originally quite fertile, but not deep, and the vegetable matter at the surface had been all exhausted; and no plowing or means of restoration being used, the clay soil had become very compact from treading while wet, and the grasses killed out by constant feeding off or over-stocking—then worthless weeds came in. He said the old pastures would have to be broken up, and enriched in some way, and when seeded down, a mixture of grasses should be used, in accordance with the English plan, though he would not recommend using as many varieties. The following he believed would be found adapted to most of the clay lands, and would form a good mixture for dairy pasture. Timothy, Red-top, Blue grass, Orchard grass, Meadow Fescue and English Rye-grass. White clover might be added with advantage, where it is known to flourish.

ON SELECTION OF COWS FOR THE DAIRY.

a good deal was said, not in favor of any particular breed, but that the farmers should take more pains to raise or procure good milkers of common or grade stock. Mr. Horr of Wellington, O., gave some telling facts from the records of his cheese-factory, and his own farm experience, contrasting the annual yield and profits of different cows and dairies, showing that some cows were worth three times as much as others for dairy purposes, and that the difference in this respect was often so great between different herds as to make all the difference between a fair annual profit and actual loss to the farmer.

USE OF DAIRY REFUSE

was the subject of an essay from Mr. Vanduser of Elmira. He gave some useful hints on the use of whey and buttermilk as food for calves and swine, giving preference to the latter animals, as the most profitable and convenient for creamery or factory men; but, adding that the profits from this source were generally less than the dairy farmers imagined. M. B. B.

Coloring cheese is often necessary to insure a fair price, for while the improvement of the article is confined to its color, the prejudice of the purchaser is thus conciliated: Pure annatto alone should be used for this purpose, and a good recipe for cutting it is the following: Take four pounds of best annatto; two pounds concentrated potash, five ounces saltpeter, pound and a-half of sal-soda, and five gallons boiling water. Put ingredients in a tub and pour on the boiling water. Inclose annatto in a cloth and, as it dissolves, squeeze it into the liquid. Two ounces of this liquid to 100 pounds of curds and proportionately.

Entomological.

A LITTLE WINTER WORK.

B. PICKMAN MANN.

Every farmer will, or ought to know for himself, whether he is troubled in summer by the presence of "tent-caterpillars" in his apple and cherry trees. If he was troubled last summer, he is likely to be troubled next summer, unless he is wise enough to prevent the hatching of the caterpillars by his foresight and activity during the winter months.

But there are more kinds than one of tent-caterpillars which attack apple trees, and the winter season does not afford us the opportunity of providing equally against the ravages of all.

Especially are there two kinds of apple tree tent-caterpillars, called so, not because they attack apple trees alone, but because they give very noticeable trouble on these trees. One of these goes more generally, and it may be more properly, under the name of tent-caterpillar; the other is known sometimes as the fall web-worm, or fire-worm. Against the latter (*Hyphantria textor*) nothing of importance can be done in winter; but it is worth while to give some account of it in order to institute a comparison between it and the other species, so that farmers who are troubled only by one or by the other, may more readily recognize either and be prepared to act accordingly.

I have not observed the fall web-worms before the third week of July, but it is stated that they appear sometimes two or three weeks earlier. There seems to be but one generation in a year, yet for some reason the offsprings of the several individuals appear at quite distant times; and the last of them, it is stated, do not hatch until the middle of August. They hatch from eggs deposited in a cluster upon the surface of a leaf. As soon as they are hatched they cover the upper surface of the leaf with a silken web, which is the result of the "united labors of the whole brood." Between this web and the leaf they feed in company, eating the upper skin and soft green tissue of the leaf, leaving the veins and lower skin of the leaf uneaten. During the early part of their lives they are not known to eat any leaves before they have enclosed them in their web. As they increase in size they spin larger webs, extending the threads from tip to tip of the leaves, and attaching the threads to the branches so that they are completely enveloped. The first webs are made near the ends of the branches, and the enlargements extend toward the trunk of the tree, and sideways in every direction.

Finally, if the caterpillars have not been disturbed, the enclosing web becomes too large to make an armful for a man. The remains of the leaves wither and turn brown; the webs are so thin as to be transparent; and the branch seems to have been scorched with fire, from which appearance the popular name of the caterpillar is derived. After some three or four weeks (the time has not been properly observed) the caterpillars leave their webs, and change their habits. Formerly social, or more probably only gregarious, and feeding upon the leaves of trees, they live separately hereafter. Scattering over the gardens and feeding almost indiscriminately upon vines, shrubs and other lesser vegetals. I have found them in the first week of October.

The apple tree tent-caterpillar which is more generally indicated by the name, or in other words the American Lackey caterpillar (*Clisiocampa Americana*) is a more abundant and destructive insect than its ally described above. It appears with the unfolding of the leaves of the apple trees in the latter part of April or the early part of May.

As soon as the caterpillars are hatched they descend to a convenient crotch made by two small branches of the tree, and spin a closely-woven web from branch to branch. Beneath this web they pass their time, when resting, or when driven to shelter by cold or disagreeable weather. They sally forth from it at morning and in the afternoon, returning at noon and at night. As they increase in size they spin new webs, of the same firm texture, and in layers parallel to the former exterior of the nest, leaving only space enough between the layers for convenient passage to and fro. Wherever they go on the branches they spin a thread of silk, by which they keep themselves moored to a tree, so that ordinarily they cannot be shaken off. These threads aggregate, in course of time, to large cords, or even sheets, completely spanning or even enveloping the bare branches and the stems. The nest, at its largest size, makes only a few handsful. When fully grown the caterpillars leave their nest, and seek a place for the formation of the cocoon. They do not tarry to feed on their journey towards a resting-place. By the end of the second week of July, the full-grown caterpillars have all disappeared.

Thus, having defined some of the differences between these two kinds of caterpillars, so that the intelligent farmer may know when he is to act I come to the point of advising what is to be done.

The eggs of the Lackey Moth, three or four hundred in number laid by one female, are placed in a broad band around the smaller twigs, near the ends of the branches, and are covered with a thick coat of brownish water-proof varnish. Each band is about two centimeters wide, and one or one and a-half centimeters in diameter; that is, as wide as the breadth of a thumb, and as large as the end of a little finger. These bands are formed in July, and contain the living insects until the following April. After the leaves have fallen from the trees, until the leaves appear again, these bands are readily visible to any person with good eyesight, standing under the eaves of the trees, and looking at the branches projected against the sky. A little experience in finding the bands of eggs will make the hunter an expert, and in a short time, during the slack days of winter, the eggs can be destroyed, which would otherwise give birth to the dreaded caterpillar at a season of the year when farmers are crowded with work. The branch should be bent downward, and the eggs cracked off with a knife, or with a thumb nail.

Field Crops.

THE SUGAR BEET.

University of N. C., Jan. 14, '78.

The State Chemist of North Carolina, whose labratory is at this place, has completed his experiments on the Sugar Beet, grown in the State; and the following partial analysis of his report may prove of interest to many readers of The Rural New-Yorker:

In 1747 a German chemist discovered that there was cane sugar in the white and red beet. In 1796 the first factory for making beet sugar was erected in Prussia. With much expense experiments multiplied in Europe. To-day nearly one-third of the sugar used in the civilized world is from the beet. French and German agriculturists succeeded by improved culture, in raising beets that would yield an average of, at least, 8 per cent. of sugar. The beet grows wild, as a native, on the Mediterranean coast. The best sugar varieties are the result of cultivation and hybridization.

As to this country, David L. Child of Northampton, Mass., in 1838, made 1300 pounds of sugar from beets raised on his farm. In 1863, Gennett Bros., from Germany, started an experiment at Chatsworth, Ill., but being discouraged, in 1870 moved to Freeport, Ill. They made 200,000 pounds of sugar in 1870, at reasonable profit. Their factory is thought to have been closed recently. Two manufactories have been built in Wisconsin; one in 1867 and one in 1870. The largest and most successful experiment was in California. At the factory at Alvoado, in 1871, 1,000,000 pounds of sugar were extracted from beets that measured 15 tons to the acre. The industry is attracting capital and growing in popularity on the Pacific Coast.

During the past season, under the auspices of the Department of Agriculture, somewhat extensive experiments were projected for the varied soil of North Carolina. The seed were the French and Silesian or "Imperial." The time at which the seed were distributed was one unfavorable accident. They were sent to about 100 farmers, in over 30 counties, in different parts of the State. There were embarrassments in several cases reported, such as the ravages of insects. Altogether, the experiments are not encouraging. The following are the results:

	Per cent.
In Morgantown, the most elevated locality, being in the hills of the Piedmont district	5.91
In Morehead City, the most eastern, being directly on the Coast	5.12
At Raleigh (1) 4 55 per cent. (2)	10,97
At Egypt, in Chatham County	11.23
At Lockville " "	10.83
In Granville County	11.46
At Hillsboro, in Orange County	10.24
At Chapel Hill " " 3.35—4.55	7,61
Other localities, from 4.30 to 7.14	

The report encourages the farmers and the Department to be ready to make more intelligent and promising experiments next year.

A. W. M.

MUSK-MELONS.

Several years ago, our correspondent Mr. T. B. Miner, received a variety of nutmeg melon from France, but being rather late in ripening, he commenced an experiment in crossing it with an early American variety, and in this way succeeded in producing a new variety of excellent quality and far superior, he thinks, to any other known sort. Its flesh is of a golden color, solid, and the melon ripens with him (Linden, N. J.) about August 15th. He calls it Miner's Hybrid Melon, the first time we ever knew him to use a word which he himself has condemned as not applicable to a cross between the same species.

THE
RURAL NEW-YORKER.

PUBLISHED EVERY SATURDAY.

Address
RURAL PUBLISHING CO.,
78 Duane Street, New York City.

SATURDAY, JANUARY 26, 1878.

We earnestly request that all letters containing money, or any communication intended for the BUSINESS DEPARTMENT *of the paper, be addressed to the Editor, the Publisher, or* THE RURAL NEW-YORKER, *and not to any individual. We cannot otherwise guarantee the prompt entry of names upon our books, or the acknowledgment of money.*

THE considerable space which we give to our report of the American Dairymen's Association, crowds out several articles which we desired to publish this week.

A NUMBER of our subscribers have written us that they have seeds of the Shell Flower (Moluccella laevis) raised from the seeds which we sent them. We would feel obliged to such subscribers, if they would state the quantities they have, and the prices at which they may be purchased.

THE seed distribution is now complete. The last packets are mailed to-day. The next free seed distribution will be announced as soon as it is possible for us to determine upon varieties and utities. We shall endeavor to so provide ourselves in quantity as to be able to send all the varieties originally announced.

COUNTRY LIFE IN WINTER.

THOUGH the farmer's life during the busy summer season is one of severe manual labor, there may and should be in winter a time for corresponding relaxation and mental improvement. Books, newspapers and social festivities may make the farmer's winters seasons to be looked forward to with pleasure instead of being so irksome that all are glad when active labor is resumed. That the last is the true picture in too many places is a fact as painful as it is evident.

"Farmers are too isolated." But with good horses and sleighs or carriages there is no necessity for isolation. It is often easier for the farmer or his sons to hitch up and drive two or three miles with good sleighing and jingling bells to a lecture, sociable or concert than it is for city residents to walk a quarter of that distance. Unless the isolation is in the farmer's thoughts there is nothing in his position which need prevent him and his family from associating with his fellow men and women. Farmers' sons find no insuperable difficulties to prevent them from seeking society unless they are unfortunately old before their time. And society is just as important for farmers and their wives as for their children.

The Grange has done an excellent work in bringing together the people of rural neighborhoods. The social features of the order are without doubt those of greatest importance. It has doubtless added dignity to the farmer's calling; but it has done this chiefly by arousing his social nature, stimulating his intellect and thus making the farmer more deserving of public approbation. It is idle to say that the people ought to seek from the farm their representatives in high official station. When farmers prepare themselves for public duties, the fact is not likely to be long overlooked. They can only do this by performing all the duties of their present positions—not only on the farm but in society, in the church and in the political assembly. Thus they will be men among men and if they are qualified for public station the fact will not long be overlooked. That high offices are so poorly filled is chiefly because so few really fit men present themselves. It does not disprove this that many able men keep in the background: that is just what such men should not do.

Winter is the time to consider these facts and act thereon. If there is a really good Grange in your neighborhood, lose no time in joining. If not, plan at once some suitable means of improving yourselves and families morally, intellectually, and socially. Farmers' clubs are excellent, but they alone are insufficient. They discuss mainly questions which inevitably occupy the farmers' thoughts. Besides, it is rare that the ladies will turn out in large numbers to hear discussions. Debating societies and reading circles are more needed. The habit of public speaking should be acquired by every young man, and many farmers in middle life will find talking in debating societies much easier after a little practice than they had expected. The reading circle should, if possible, be in connection with a reading room, where the best magazines and periodicals not generally taken in the neighborhood, may be seen.

It is unnecessary for every family to subscribe for all the periodicals which its members may wish to read. Taking a few of the purest and best for the family circle, a good supply additionally may be had by interchanges among neighbors, or by joint subscriptions of several neighbors to the higher priced monthlies and reviews. For a magazine which comes once a month, four families at least can have the reading before next month's issue is due. In very many cases, one or two copies of such magazine will supply the people of a neighborhood or a town. This is not a suggestion to induce people to take fewer periodicals; but to introduce some of the best literature of the day where it would otherwise rarely be seen. Once introduced, the habit and love of reading will grow, and very soon largely increase the subscription list of all worthy periodicals.

WHAT DID IT LIVE UPON?

FIVE YEARS, the coming spring, we purchased a Yellow Bellefleur and planted it upon a sloping though rather springy piece of ground. It bloomed the first season, and formed flower-buds every succeeding season profusely. We have never seen an apple tree of its size and age so full of blossoms. Seeing that it made no growth; that some of the terminal twigs were dead every spring, and that it decreased rather than increased in size, last fall we set about examining the roots, to ascertain, if possible, the cause of such singularities. The roots as well as the stock up to the graft insertion, were found to be quite dead, with the appearance that they had been dead for a long time, as the roots were partly decayed and had evidently made no growth since their removal from the nursery grounds.

After the second year, we supposed that the tree had so exhausted itself by profuse blooming—as is not unusual with this variety—that it had no power to form new wood, for which reason the blossom buds were pinched out the third season as soon as they could be determined. But no improvement was visible in its wood growth. Had the tree been weighed when first set, and when it was taken up last fall, it would probably have been found to weigh less at the latter than at the former time.

No doubt that in many instances when fruit trees blossom well but set no fruit (as in this case) and seem in tolerable health, if the roots were examined, similar disturbing causes would reveal themselves and we should be entertained with fewer learned speculations respecting "impotency of pollen," "sterility of the pistils," the fine distinction between "vigor" and "vitality," etc., etc.

We said that the roots of the Bellefleur tree had evidently made no growth, and that they had been dead for a considerable time—perhaps from the time of transplantation. The tree itself (graft) must therefore have lived in part, upon the decaying nutrient particles of the stock—or, did it draw its sustenance from the atmosphere alone?

EDITORIAL BLANDISHMENTS.

No one undertakes larger contracts in good intentions than publishers of newspapers. They are an imaginative race, and it is not to be wondered at that their schemes are more comprehensive than is their ability to execute the details. Commonly, about the beginning of the subscription season, many knights of the pen dream a dream, and a vision appears to them. It is a perfect newspaper. Such a one as they would like to make and own. When the time is ripe for an annual prospectus to subscribers, the ideal paper occupies the most prominent niche of the brain, and it is only human nature that the Mss. page should take its coloring, not from what it is to be, but from what it ought to be—if the means were only in proportion to the undoubted ability of the writer.

It comes to pass, then, that more extended plans for the new year, are heralded than can be executed, and readers mourn promised features, as the year drags its slow length, whose announcement filled them with gladness. The editor is not, perhaps, remembered in the family prayer as the spirit of a just man whose promises have been made perfect. Speaking for ourselves, however, as we recall all of our promises, we have no desire to retract or to retrench any one of them. And this we say quite independently of the fact, that our circulation continues, up to this date, to increase over that of last year. Had it been otherwise, we are not aware that we have made a promise or held out a hope that we are not prepared to fulfil. Let us see.

NOTES.

Patenting Plants.—We shall be glad when those good people who advocate the protection of new plants by letters patent shall have had their say and become convinced of the absurdity of the scheme. Ought not he who spends a life-time or a year in producing, creating, obtaining, manufacturing, (will any kind reader name the proper word?) a new and superior variety of fruit, flower or tree, be rewarded as well as any other person who, by his labor or ingenuity, improves upon the best article of its kind previously existing? When tastes no longer differ; when our knowledge and perceptions of color, flavor, vigor, hardiness etc., shall have assumed definite relationships and the soil, situation and season no longer affect the same plant differently and all can understand the source of the pleasure which the old lady derived from "kissing the cat," then we might join in advocating the protection of new varieties of plants. Until that time, however, we say to those who do not deem the benefiting of the human race a strong enough reward for their labor and pains in creating, producing, inventing (here again we want that word) a new green pea, or a rose, or an apple—we say to them, "Why not confine your talents, dear Sirs, to the production of something that *can* be patented?" Now answer that!

A Year of Fraud.—In the history of this country there has probably been no year that has equalled the last in the amount of official peculation and mercantile fraud which has shocked the moral sense of the public and brought unmerited suffering and ruin on thousands of innocent heads. A list of the more prominent instances of notorious fraudulent criminality during the twelvemonth, foots up a trifle over $30,000,000, and of the dishonest rascals who have brought such opprobrium on the age and country and such suffering on a large number of the poor, scarcely half a dozen are behind the prison bars which should shut in the whole of them. A public sentiment healthily severe, and a vigorous enforcement of all legal penalties, are the most effective means of putting an end to such a sad display of knavery.

Midwinter, the proverbially lazy season for the farmer, is so only to the lazy farmer. The grand trouble with industrious people, no matter what their occupation, is that they always have too much to do. Industrious farmers need the hints of agricultural papers only as they may lay before them the work which had best be attended to. For the others, the best advice is: shake off your laziness and go to work. There are hundreds of things to be attended to and you know it! If you don't, sell your farm and hire yourself out to those who do.

BREVITIES.

ENGLAND wants more sunlight—it is a trifling request to be sure.

WE sowed upon the Rural Farm, last fall, five acres of Clawson wheat, which is now in fine condition. Wheat sown earlier in the same section has suffered severely from the Hessian fly.

WE hope our farmers will try, as an experiment, if they have not done so before, planting corn in drills next spring. The experiment can be tried without addional cost, and may prove a source of additional gain.

HENRY M. STANLEY, the now famous African explorer, is having a triumphal journey, indeed, *en route* for London. Among his truest admirers was the late King VICTOR EMMANUEL, who left a medal that Mr. STANLEY says he would treasure through life as one of his happiest souvenirs.

THE advantage of the supposed hybrid cotton plant (Gossypium and Hibiscus), is that it produces "pods in the axils of the leaves instead of branches" so that on the same area of land nearly twice as many plants can be grown as with the old varieties. The cotton is said to be of good quality.

IN all localities where the weather up to within a few days has been so warm, that the ground has not been frozen to any depth, trees, shrubs, strawberry beds etc., may now be covered with manure or straw, with the same good effects as are usually experienced from similar mulching six weeks earlier.

THE editor of the Germantown Telegraph remarks that the Albemarle pippin looks very much like its progenitor, the Newtown pippin, and is about the same size, but in point of excellence it far excells it, in his estimation, as it does every other apple he has ever tasted. A pretty good compliment, we should say, for the Albemarle pippin.

WE were pleased to receive a call from Mr. WM. WELD, the editor of the Farmer's Advocate, London, Ont. Mr. WELD travels a good deal, and says he can glean so many new ideas in this way that it well pays for the time and expense. The advantages of travel are partly secured by attending Farmers' clubs, Hort. and Ag. Societies and the like.

MANY of our friends ask the question—Shall we plant Geranium (Pelargonium) seeds now or wait until spring? If they have greenhouses or even sunny windows, we say, plant now. The seedlings transplant easily and will bloom earlier. That is, if planted now, they will bloom the latter part of next summer. If sown not until late in May or the first of June in the open ground, they will not bloom until next winter.

THAT clipped horses perspire less is offered as an argument in favor of clipping. It seems to us a good argument against it in that other organs are obliged to perform the excretory function of the skin, or diseases or a quicker liability to diseases will be the consequence. We regard clipping horses as a practice that proves the owner who orders or suffers it to be done as either extremly cruel or extremely ignorant.

WE hope our readers who may want fruit or ornamental trees or plants of any kind the coming spring, will send for the catalogues, the receipt of which we announce from time to time, and compare them carefully. There is time to do it now. These catalogues are full of trustworthy information, the pithy teachings of years of experience. It is the rule of this office to mention every catalogue received. But we shall take care to praise none but those of establishments with which we have had dealings or some personal knowledge.

Literary Miscellany.

ANNI FUGACES.

Oh, pilfering years, whose fingers light
O'er form and feature play,
And, half in frolic, half in spite,
Bear every grace away;
Heed not this foolish burst of tears,
Your silent task fulfil;
Yet let me keep, O gentle years,
My heart's fresh impulse still.

Yes, quench the love-light from the eye,
And thin the clustering hair;
I yield to thee, with just a sigh,
Whatever charm was there.
But, oh! the fervor and the truth,
The strength to do and will,
The pure, unsullied heart of youth,
Kind robbers, leave me still.

[Frederick Langbridge.

HER MOTHER'S SECRET.

[Continued from page 45.]

"My mother's name," she answered, overcome by his manner,' was Alice Estcourt; her old lover, Linton; and the man who married her called himself Arthur Mortimer."

"Arthur Mortimer Tressider?" he said, with a groan "I am your wretched father! Oh, what a tale of shame and woe must now come before the world! My child!"

He held out his hands, but his sight failed him, and he fell forward, with a deep groan in a fit.

Edith rang the bell, and then, despite her agony at the words which had escaped her father, she stooped and began unfastening his cravat.

When the servants came in, she bade them summon Lady Tresseder at once, as their master was ill.

She hastened to come with Royston and a doctor, who was among her usual morning visitors.

"A slight attack of apoplexy," said the medical man; "let him be put to bed at once, and I will see what is to be done."

CHAPTER X.
The sick-Bed.

Edith went away stunned and horrified. This, then, was the man who had deceived and betrayed her mother. It not only must be so, but he must have been married at the time, as Blanche was the same age with herself.

And the noble-looking man, so kind and generous, so sweetly fatherly to her, was, indeed, her parent, and yet she was doomed to hate him.

But not while he was sick—almost dying.

She waited with welling tears, bated breath and deep anxiety for news. She was on her knees.

Meanwhile all had been done for Sir Arthur that could be done, and after the remedies had been applied, the physician expressed an opinion that he would do well. He had a very excellent constitution, and they were of opinion he had received a sudden shock or surprise.

"I have no doubt of it," said Lady Tressider, with a strange smile.

A nurse had been sent by one of the medical men, and she was to remain up all night with the sick man.

Royston would remain smoking in the library, to be within call.

Lady Tressider intimated her intention of lying down in her clothes.

Dinner was announced, and as one must go through the duty in times of sickness, and death, every one joined the table, except Edith.

Royston, however, gravely sent for her, and as he might in a few hours be master, neither of the ladies dared interfere. But their satisfaction was unbounded when a message came that she was altogether too ill to come down, but would take a cup of tea in her bedroom.

"Won't some one see her?" asked Royston.

"After dinner," was the cold reply.

But after dinner Royston sent up a note by a maid, and begged Edith to come down to the library for half an hour. He would not detain her longer. Edith came, looking very ill, with tearful eyes and swollen cheeks.

"My darling, what is the matter?" he said, caressingly. "Has your illness anything to do with my uncle's sudden attack?"

"Yes; something I told him," she faltered, "gave him a great shock, and made him ill. But I cannot, without his permission, repeat a word of it. He is better?" she gasped.

"Oh, yes; and will, I believe, get quite well," he answered. And so, in talk, more than half an hour passed away.

While they were yet talking, the butler entered, and informed them that Sir Arther was quite calm and collected, and wished to see him alone.

"I will come at once," said Royston.

"Oh, my lost love!" said Edith. "Now you will know all, and we shall be parted for ever! But go—ask me no questions!"

And Royston was obliged to be satisfied with this, as he could not keep his uncle waiting.

He went to the room, and found his uncle to all appearance alone. He had sent away the nurse.

"Close the door," he said, in a low tone; "and then give me a cordial. I must not say much. But now fasten the door. We must keep the fearful secret as long as possible."

"Uncle," said Royston, kindly, "you are agitating yourself. Wait until the doctor comes."

"No; right must be done," he insisted: "and I want you to do it. So now you must start for Longmead, and make certain researches. If what Edith told me can be substantiated, she is my only daughter and heiress!"

"Great Heaven!" cried Royston.

"Yes, it is wonderful. But the wrong, if there was one, was no doing of mine," he went on. "I have been deceived."

"But as her mother only died six months ago, what about Lady Tressider?" urged Royston.

"My supposed present wife is simply Widow Baker," groaned the crushed man, "and I am a bigamist! How is the poor girl?"

"Utterly overcome," he answered. "Evidently she looks at things from the dark side."

"I fancy," the other answered, "she has nothing to fear. If Mrs. Marshall can be identified with Alice Estcourt, there is an end of the matter. If I live, I can prove the identity of Arthur Mortimer with Arthur Mortimer Tressider. Besides——"

"But what do you want me to do now?" asked his nephew.

"Take down the names of a few places—the place where we were married, the place where we lived; then visit the doctor at Longmead, to whom she told all, and who signed her statement," he went on again, sipping his cordial. "Then come back, and I will tell you what to do."

"Everything shall be as you say," was the nephew's reply. "Edith, my cousin!"

"And my heiress," the other went on; "you will have only the entailed estates."

"And her, more precious than all!" answered Royston.

"I hope so, my dear boy. Now send back the nurse, and I will sleep," said the Baronet.

The nephew hurried away, and had scarcely gone ten steps when a ghastly figure came from the head of the bed. It was Lady Tressider. She crept out of the room with extreme caution, and going along the passage, entered Edith's room. She rose hastily, as the mistress of the house entered.

"Is anything the matter? Is Sir Arthur worse?" she gasped.

"Your father is better," was the cold response. "Be not astonished, girl. I know that this disgraceful discovery has been made.

"How can you know it?" faintly said Edith.

"No matter—I know it. Either you are the offspring of a wicked intrigue between my husband and some other woman, and then you have no right to remain an hour in my house," she went on pitilessly; "or you are his lawful daughter—in which case I shall leave the house to prefer a charge for bigamy!"

Edith shuddered.

"Fancy his honored name bandied through the streets!" she said with a hollow laugh. "But he married me with a wife and child living. He will be sent to prison for seven years—a pretty ending for Sir Arthur Mortimer Tressider!"

Edith did not hesitate one moment. In either case, her presence in the house was not right. For her own part, she saw no likelihood of her mother's marriage proving legal. How could the matter be proved after all these years?"

"I will go at once," said Edith, quietly, "and you shall not hear of me again! Let one of the maids call a cab, while I pack up."

Her luggage was put into a vehicle while Royston smoked in the library.

She had plenty of money, and she bade the cabman drive to a respectable quiet hotel near the railway station. There was no name on her boxes, and she gave the name of Estcourt.

Meanwhile Lady Tressider had gone to her daughter's bedroom.

"Girl," hissed the mother, "we must be up and doing. If your father lives, we are ruined! Edith is your elder sister and the only legitimate heir to Sir Arthur. Let her right be proved, and we are outcasts. You know how your father loves us!"

CHAPTER XI.
Twelve Events.

When, next morning, Royston entered his uncle's room, he found that gentleman very calm and collected. He had enjoyed a good night's rest.

"Well, Royston, my boy," he said, in quite a cheerful tone, "are you quite ready to go?"

"Yes, uncle, answered the young man; "but, before I leave, I must convey to you some rather unpleasant intelligence. Miss Edith has left the house."

"What can it mean?" exclaimed the Baronet, in a tone of deep irritability. "She must be found. How did it happen?"

"Well, sir, I have held a strict investigation, and by threatening the household in your name, have learned part of the truth," he said. "It is not pleasant," he added, in a hesitating kind of way.

"Tell me all. Time is everything!" cried the other.

"Just as I left you, Lady Tressider was seen to leave your bedroom, whence she went to Miss Marshall's," he continued; "then my aunt went down and ordered the cab to be sent for, in which she shortly after went away."

"Send a messenger to Linton's at once," said the Baronet, anxiously; "probably she has gone there!"

The man took a cab, with a note from Royston, but no tidings had been heard of her. Most likely his young friend would write.

"Go," said the Baronet, sternly, "and let right be done. Satisfy me that Edith is my child, and I will publicly own her, come what may. Be not long gone; spare neither trouble nor expense."

"Leave all to me," replied Royston, and hurried out without seeking an interview with either aunt or cousin. He need not have troubled himself; they were out.

When they returned, they asked for Royston Yorke, and found that he had taken his departure.

The two eminent doctors who came twice a day had, on the second occasion, an interview with Lady Tressider, who was very anxious.

While they sipped their wine, the question was discussed.

"Then he is progressing well?" she said, after they had made a favorable report.

"Yes, my lady," replied one. "Unless something very unexpected happens, he will be up and doing as well as ever in a week. His constitution is excellent."

"That is good news," was the reply.

"She seems really anxious about her husband," said one of the doctors, as they went down stairs. "I did not think it of her."

"His death would make Royston Yorke the Baronet," answered his friend, drily.

"Something in that," remarked the other.

Lady Tressider entered her boudoir, and sent for Blanche. She was very pale and haggard, some might have thought from sorrow, while keener physiognomists might have suggested fear. Blanche entered, looking weary and anxious.

"How will it all end?" she said pettishly.

"If your father lives, badly for us. As things stand at present, I have a rich jointure, my own fortune settled on me—on you after my death, while Sir Arthur has left you a rich legacy. I have seen his will, and since he knew that Royston would not marry you, he has added some more, showing me the will. But if this woman steps in, we are lost; the will is null and void."

"But surely my father would not let me fall into poverty?" pettishly cried Blanche.

"He is not your father," she answered, in a low, hushed whisper. "You were born one year before we were married. My first husband was your parent. You are two years older than you think."

"Why this cruel deceit?" huskily asked the girl, utterly crushed and overcome.

"Your father and I were traveling in Rome when he was killed by an accident. I had a young baby, but I kept it out of sight. I met Sir Arthur, who was fretting himself to death about the death of his first wife, he told me.

"Some one had told him that she had eloped with a certain major; but that person being found, proved that he had been employed by the then Baronet to make believe with the girl that she was not his wife; that, maddened by this discovery, she had escaped to the river and drowned herself.

"The Baronet was susceptible; I was an interesting young widow, and obtained unlimited power over him. We were married, and traveled about for years.

"When we took you from a school, I persuaded him, as we had no children, to adopt you as his heiress.

"To a certain extent, he did; but never gave you out as his child. He allowed the inference to be drawn."

"Then I have the honor to be Blanche Baker!" said the girl, with savage bitterness.

"Unless we can crush this girl," was the savage response.

"How is that to be done?" asked the girl. "Do you expect me to slay or poison her?"

"You might do worse," was the response whispered in her ear. "But here is a man who has a formidable attack of apoplexy, who was considered dying. We stand on the verge of ruin. No one can prove the identity of the two women of different names but Sir Arthur. He will, if he recovers, do so."

"What then?" asked Blanche, gloomily.

"He must die!" was the answer of this modern Borgia, speaking in a hollow tone.

"Mother," said the girl, after some reflection. "I understand many things that I did not before. If Sir Arthur has not shown me the deep affection of a parent, he has treated me well and kindly. I will do nothing against him. If he dies, well and good; but I will have no hand in it."

"You would betray me?" gasped the mother.

"No; only let me know nothing, and then I cannot speak," was her answer.

With which she walked away.

Lady Tressider looked at her for a few minutes in silent contempt, and then followed.

Not another word did she say of the project which she had ventured to unfold. She kept it within her seething and teeming brain. But she was determined not to fall from such a hight without a struggle.

The day passed slowly. Many called, but no one was admitted except the doctor. Mr. Linton sent round to say that he had heard no tidings of Edith, but he had privately issued a description of her to every police-station and offered a considerable reward.

As soon as Sir Arthur was well enough, he would pay his respects. He was very anxious to know why Mademoiselle Marechale had left, and hoped there was no fault on her side.

When this message arrived, the intimate family physician, Dr. Wilcox, was in the house, and Sir Arthur got him to write these lines:

"Dear Linton:—The poor girl left under a very sad misapprehension, which I will explain when I see you. A. M. Tressider."

One of the servants sat with the Baronet while the nurse took her meals and got a little sleep. She came on again at eleven, when, if need be, she slumbered in her cosy arm-chair. She was a very excellent woman as nurses go, and only gave way to slumber when compelled by utter exhaustion.

This woman, sent by the doctor, was, in a word, shrewd and faithful. She saw that the Baronet was comfortable, smoothed his pillow, gave him his dose, and then composed herself.

"If I should dose off just a little, sir," she said, respectfully, "just pull that white cord"—she had tied it to the head of the bed and to her own arm—"and I'll be up in a minute."

"Very good," said the sick man, and closed his eyes in search of much-needed sleep.

No sound was heard but the ticking of the watch on the table, of the breathing of the nurse, and Sir Arthur prepared for slumber. There was an anodyne in his draught, and he would probably sleep sound.

He dozed, and then went off, as she believed, into a deep, sound slumber. Then he dreamed; yes, dreamed, oddly enough, that he was in the same room, but rather under somewhat changed circumstances.

The nurse appeared to have disappeared, and another woman had taken her place. She was taller, and dressed in white, and moved along the floor without making the slightest sound.

Then she leaned over a chair, and he knew it was that in which the real nurse slept.

Then she gazed at the bed with a fixed glance. Her eyes were like coals of fire, and a steam seemed to come from her mouth.

"Her hair was perfectly dishevelled, and from her bosom she took something—a bottle.

This she held over a small glass on the table—a glass from which he usually drank—and into this she dropped—something.

Then she turned and fled noiselessly away, with a white, scared face and quivering lips.

Then Sir Arthur Mortimer Tressider knew that he was awake, and had seen his wife.

"Wretched woman!" he said to himself; "she somehow knows all, and wants to poison me before I can prove the rights of my child. Heavens! if she were to succeed I could never do justice to my poor Alice, murdered by my cruel father. And yet it is a temptation. Well, it must be thwarted."

And he pulled the string, at once awakening the vigilant nurse.

"Anything the matter, sir?" she cried.

"Oh, no; only I cannot sleep, and it is nearly my time for another dose," he said. "Nurse," he added, "you are a discreet person, and will allow me to do what I wish without asking questions. Put the glass in the cupboard at the head of my bed, just as it is, and give me the key."

The woman started, but obeyed, noticing as she did so, there was sediment in the glass.

She selected a clean glass, rinsed it, and gave the Baronet his medicine.

Shortly after he slept nor waked until dawn. He was calm and collected, but stern beyond his usual manner. When Doctor Wilcox came, the medical man saw the Baronet was agitated.

"Send the nurse away," said Sir Arthur, "and now fasten the door. You have done so? Well, take this key, and take a glass from out the cupboard there—my medicine glass."

Wondering excessively, the physician obeyed, and brought the glass out.

"Don't waste that," the Baronet went on, sarcastically; "don't waste a single drop, but when you go home test it for poison, and let me know how many doses it would take to kill me."

"My dear friend——" began the physician.

"Come back at four o'clock," said the Baronet, querulously; "and then we will talk about the matter. I have much to say."

The doctor saw to him, gave the nurse some fresh instructions, one of which was at his own request, that he should not be disturbed under any pretence whatever, even by his own wife

This excited no comment, as it is very usual to be excessively cautious in such cases.

At four he returned, with a very white and serious face, which made the Baronet smile.

"Was I right, Wilcox? Is there a prisoner in the house?" he asked.

"There is! Four doses taken four consecutive nights would have killed you, and left no trace under the circumstances," he replied, solemnly; "but, in the name of Heaven, how did you discover it?"

"I saw it done," was the reply; "and bade the nurse, whom I awakened, put it under lock and key."

"But, my dear friend, do you intend to do nothing?" said the doctor; "it is your bounden duty."

"I shall do nothing until the time comes," was his sorrowful reply. "The fact is, there is a great domestic tragedy going on in this house. If I recover, there will be great changes; but I want all my intellect and thought to do justice. But now I am only on my guard I shall know what to do."

"But will you not warn the evil-door?" said the doctor; "it should be done."

"I wish to have the evil-doer wholly in my power," was the sad reply; "it may save much trouble."

As the master of the house was obstinate, and could not be controlled, Wilcox yielded, but took the precaution to put a powerful antidote in his sleeping draught.

That evening, the nurse still fast asleep, and the sick man awake, but pretending slumber, the awful vision of the night before again appeared, and the same performance went on over again.

Once more the small glass was locked up, and this went on for four nights more.

Doctor Wilcox affected to believe Sir Arthur

was much worse, and in her guilty soul the woman rejoiced.

CHAPTER XII.

The Return.

On the sixth morning after his departure Royston Yorke returned and presented himself before his uncle.

The good doctor had come with him and was quite ready to repeat, word for word, the dying statement of the lady.

"But she gave it to her daughter," he added, "in my presence, to take up to Mr. Linton."

"Very good. That is so much gained," said the Baronet; "but how about the certificate?"

"I have a copy of it," replied Royston; "but that proves nothing."

"Exactly so," said the Baronet. "I want the original copy that was handed to my wife, and which I put in my pocket, which she ought to have had."

"That is most mysterious," mused the Baronet, "and it must be somehow explained. My poor head is not so clear as it was; but I remembered something very particular about that certificate."

"If you could only remember," urged Royston.

"I will try," said the Baronet, whom anxiety and other matters had rendered very weak.

"Can I do anything more?" asked the doctor politely.

"Oblige me by being my guest for a day or two," said the Baronet, heartily. "My nephew, my more than son, the discoverer of my daughter, will entertain you. I have need of you," he added.

"Then I will stop," replied the doctor.

"Now, Royston," continued his uncle, "oblige me by taking the doctor down to lunch, and sending my man up to me."

The man came, and was surprised by his master's first order.

"Dress me," he said.

"But, sir——," he replied, really believing that the Baronet was going mad.

"I am not nearly so ill as I look," he said, more peremptorily, and got out of bed without any assistance.

The man saw at once how great a change there had been for the better.

He dressed his master carefully, and then shaved him, so that he looked himself again, only thinner and paler. Then he took some refreshment, which seemed considerably to revive him. This done, he wrote two letters, which he dispatched by special messengers, and waited.

His countenance was deeply agitated, but he otherwise kept down the outward manifestation of his anxious soul.

The first to arrive was Doctor Wilcox, and, as soon as he came, he sent to ask Dr. Williams to join them. He came at once, and was duly introduced to his professional brother.

"Now, Wilcox," said the Baronet, "have you brought the test for that poison with you?"

"I have brought several tests," was the cautious reply, and he placed a small chest on the table.

"Now," said the Baronet in continuation, pointing to four wine-glasses in a row, "take one of them at random, examine it, and then test for poison."

Doctor Williams looked very grave, but at once went to work, and after some little time, turned to Wilcox with a look of wonder on his face.

"This is a very rare and little known poison," he said, "and very difficult to detect or defeat."

The other doctor mentioned the name.

"That is sufficient. Put it away, and now summon my nephew," continued Sir Arthur. "I wish him to come up now. I expect some one else shortly."

Royston was soon in the room, and then the conversation became more general until Mr. Linton arrived. He was gladly welcomed by the Baronet and by Royston.

"No news of Miss Marshall?" asked Royston, eagerly.

"Not any whatever. She has left London," replied Linton, "or is in secure hiding. She is tolerably well provided with money, unfortunately. But may I ask why you are so interested in her?"

"Heavens, Linton!" cried the Baronet; "but, there, you don't know it. Edith Marshall is my daughter and heiress—and, furthermore, she is Edith Tressider."

Linton fell back as if struck.

"Are you Arthur Mortimer," he said sternly, "who eloped with my darling, my affianced wife, and then deserted her?"

"I ran away with your affianced wife," was the grave answer, "but I never deserted her. We were duly married, as Royston is able to prove; but the identity is the same. Have you the statement with you which Edith told me in brief?"

"I have," was the cold reply of the man, who was for the first time face to face with the robber of his peace and love.

"Will you kindly read it?" said Sir Arthur, gently; "slowly—not omitting one word."

The other obeyed.

Suddenly Sir Arthur leaped up.

"My dear sir—my dear sir!" cried the doctor.

"Have you that desk?" said the Baronet, in accents of agonized dread.

"I have," was the quiet reply.

"Then send for it. By Heaven, it is a miracle! Now I can make it all clear," said the Baronet. "Do not hesitate. I am my daughter's guardian until she is of age. Believe me, Linton, all shall be cleared; "and, by Heaven," he added, in a stern voice, "justice shall be done! I will send a man, and do you write to Martha to bring it."

"I will," replied the virtuoso, overcome by the other's dignity of manner.

The note was written, and despatched by a messenger in a Hansom cab.

Meanwhile, Lady Tressider and her daughter were below. As far as they could make it out, there was a consultation of physicians, which proved that he must be worse.

CHAPTER XIII.

Waiting for the Desk.

"I may as well," said the Baronet, as soon as the statement of his wife was finished—a statement which, towards the end, made him weep bitterly,—"while we wait for the desk, give some explanation.

"Very dependent on my father, I had to be careful in my actions. Without his assistance, I had very little more than the portion of younger sons.

"He gave me permission to marry whom I pleased so that she was rich; but poverty was to be my portion if I married a poor woman.

"Hence all the precautions I took to conceal my marriage.

"They were useless. In the hight of my happiness I was found out. But my father took care not to let me know anything about the matter.

"He summoned me to town on pretence of asking my signature to some documents, and when there he detained me some time.

"As soon as I could get away—I noticed a disagreeable smile on his face—I darted off in search of my darling. I could find her no where; but they said she had eloped with a man whom, on their description, I knew. I went at once to town.

"I met my man—that is, I went to his lodgings. With a pistol in one hand, and a horsewhip in the other, I asked him news of my wife.

"He had none to give me.

"'I am a desperate man, I said. 'Life has no charm for me. Take me where she is, or I will shoot you like the dog you are!"

"'She is dead!' he replied coolly.

"'But—how dead?' I frantically cried.

"'Your worthy father found out your little affair. He paid me handsomely to go down and break it off. In want of cash, I went down, saw the lady, and told her you were a scoundrel—had not married her at all. On which the foolish lady ran to the river, jumped in, and was carried away by the current.'

"As a similer story was told down there by some one, doubtless paid by him, I believed; and after giving him a good thrashing, I went to my father's house.

"He saw by my face I knew all.

"'So you did not find her!' he said, with a diabolical sneer I never have forgotten.

"'I have not, sir," was my cold reply. 'My wife died, murdered by you! Well, it shall not serve you, as I shall never marry. Never, too, on this earth do we meet again. You have taken, in cold blood, the life of my wife, and I can never forgive you!'

"He began humbly to beg my pardon at first; but when I flatly refused, he flew into such an awful passion, that he dropped down, and before medical attention could be called, he was dead.

"I was sorry, but my own sorrow had made me callous; and as soon as the funeral was over, and I had taken possession of my empty honors, I left England, leaving my poor darling in the belief that I was faithless and false.

"I should not have believed the lies, but spent thousands to have found her.

"I traveled more like a madman than a sane person, and in Rome met a widow—a vain, vulgar English woman, with money.

"As a satire on my father, I married her, though, after some months, I heard things said of her that made me inclined to shudder.

"But I did not believe the reports; they were falsehoods, calumnies—anything.

"Well, at last we came to England, with her child, which, having none of my own, I allowed her to call ours.—To be continued.

THE GOLD ROBBER.

It was on a November evening that we all sat round a cheerful fire after dinner. Uncle John, who had come home from Australia a week before, was giving us various bits of information about the climate, people, &c., in that favored country. He paused for a while, so I asked him, "Couldn't you tell us a story of your adventures, or something that happened to you, uncle?"

"Well," he answered, "I've had so many adventures, small and great, that it's hard to pick out one; but suppose I tell the first that happened to me,—will that satisfy you?"

We all declared we should be delighted to hear it; so, giving the fire a poke, and all of us drawing near the blaze, he began the following:

"You know, when I first went to Australia, there was a great excitement about the gold that was being found in several places; and, like a great number of people, I was seized with gold mania, and went to the diggings. You all know, also, that I was very fortunate there,—but of that I have nothing to say now, as I am going to tell you what befell me one night, about a fortnight after my arrival at the diggings.

"Your uncle Tom, who was with me, was up the country for a couple of days with an old schoolfellow, whom he had found in that remote region; so I found myself on this particular night the sole occupant of our hut. I had retired to my hammock rather early that night; but I could not go to sleep, but kept tossing about for a long time. At last I opened my eyes wide, with the conviction that sleep was not within my grasp for that night; and I began looking round the hut, but at such objects as the remains of the fire made clear enough to be seen. As I looked round, a dark object in one corner arrested my attention; it was a corner not lighted by fire, so that I took some moments to make out what it was; but at last I came to the pleasant conclusion that there was some one else in the hut besides myself.

"Now this was a particularly inconvenient thing, to say the least of it; for I knew nobody personally who lived about us; but I knew very well that as a general rule, they were a coarse low lot of ruffians, a great many of them convicts, and men who had to fly from their countries for various reasons best known to themselves, so you may perhaps form a slight idea of my feelings. I knew it was not my brother, for he would not be back for two days; besides, why should he come in so silently, and stand there so mysteriously. But what puzzled me most was how any one could get there, for I had most carefully fastened the door before retiring to rest. I thought my eyes might be deceived, but on looking more intently at the dark object, I distinctly saw the outline of a pair of shoulders and one arm, but it was impossible to see the head or feet, as the shade was so heavy in the corner.

"Now, in this very corner we had a chest, in which we brought various clothes and other necessaries, and in which we meant to put any gold we might find—I say meant, because we had not got any up to the present time—so I, of course, concluded that my visitor was examining this chest with a view of robbery, and I thought the best thing I could do would be to remain quiet for the present; but I spoiled my plan by turning on my side so as to watch the robber better, and in doing so I made what seemed to me a great deal of noise. I now thought there was no use in concealment, so drawing a revolver, which I always kept under my head at night, I called out, "Come forward at once and show yourself, or I'll blow your brains out."

"I made as much noise as I could in cocking the revolver, so as to give my threat more weight; but the gentleman in the corner seemed to take notice, for he remained perfectly quiet. I was undecided what to do till the thought struck me that the robber might at that moment be meditating shooting me from where he was, and this thought made my blood run cold, for I thought of the friends and relations I had left at home, and of the state they would be in when they heard I had been shot in Australia; so I again called out, 'Whoever you are, I'll give you but one chance; I'll count three, and if at the third word you don't come forward, I'll fire.'

"I told you I could not see the man's head, so I aimed at where I thought it ought to be, and counted slowly, 'One, two, three!'

"At the word 'three' I fired four shots in quick succession, for I thought that in the almost total darkness my aim might not be very good; but they seemed to have taken effect, for when the smoke cleared away, I looked in vain for my midnight visitor. I could not summon courage to get up and look for his body; not that I was exactly afraid, but I had a horrible feeling of having shed a human being's blood, which I had never done before, and I firmly believe I would almost rather have been shot by the robber than have the fearful thought on my mind that I had killed him.

"Never did I spend such a dreadful night. I could not get rid of the one thought of having deprived a fellow creature of life, especially while he was in the act of robbing, and perhaps intending murder; but more horrible than all was the idea that I might possibly have been the means of sending him to a fearful eternity. In vain I tried to persuade myself that it was to save my own life I had done it; this seemed to me a poor excuse. However, I at last fell into a disturbed sleep, which lasted till morning; but the moment I awoke the dreadful night recurred to my mind, although I felt rather more calm. I thought I had had a horrible dream, but on examining my revolver I found four chambers discharged. I rose and looked about the room, but in vain I sought the body of the intruder. This, however, relieved me greatly, as I thought he could not have been killed, but only wounded, and had escaped out of the hut while I was asleep; but on going to the door I was more perplexed than ever, for the door had evidently not been opened, as it was securely fastened on the inside.

"That day I could not bear to do anything but sit at my fire and think over my adventure, and try to solve the mystery, for mystery I concluded there certainly was; but I could come to no satisfactory conclusion with regard to it.

"The next day my brother came back, but I thought it better not to say anything about my visitor to him—at all events not until I found out who or what the intruder was.

"That evening I returned to the hut after my day's work. I had found my first nugget, which, however, was a very small one, and was entering the door, when I saw my brother sitting on a stool, with a coat across his knees, which seemed to perplex him very much. When he saw me he called me, and asked me if I could account for two holes which were in the back of the coat he was examining. Of course I knew nothing about them. He said he had left the coat hanging in the corner, and had just found it down behind the chest, and with those two holes, which he thought very like pistol shots, through the back.

"The explanation flashed across my mind immediately: my midnight robber was nothing else than my brother's coat hanging on the wall! On examining it further I found the loop by which it hung was cut, evidently by one of the shots, and this accounted for its falling.

"I need scarcely say what laughter it caused when I told my brother this; but, small adventure as it seems, I shall never forget my night with the gold robber." F. V. O.

A FEMALE DETECTIVE.

A strange, not to say sinister, character has recently passed away from among the dark dens of crime, which she haunted with unflinching persistence. This extraordinary woman was as peculiar in her appearance as in the nature of her avocations. Short, thick-set, with the arms of a prize-fighter, and features which might perhaps be compared with those of a bull-dog, but certainly bore no resemblance to the ordinary countenance of "gentle-women," this creature could not fail to inspire a sense of repugnance in those even who were disposed to admire her courage and acknowledge the utility of the services she rendered. There are but few persons, however, who were ever acquainted with the secret of her life. In Blackfriars there lives an artisan, much respected by his neighbors, whose voice is not without influence at election times, but who is also notorious for his republican, not to say revolutionary, views. Some years ago his children and wife were seized with scarlet fever. Helpless and alone, with all his family dangerously ill, the father rushed wildly about for assistance, and when the woman, whose appearance has been but faintly described, came forward and offered her services as a sick-nurse, he at once accepted her help. She was known in the neighborhood as an experienced nurse, and had often been recommended to poor patients by the parish doctor. The nurse subsequently confessed her real character. In a word she was a police detective. Nursing was but a pretext; it was an excellent excuse for gaining admittance into suspected households, and doubtless the police had their eye on this republican.

The female detective in question was not, as a rule, employed on political missions. Her chief duty was to discover criminals, and those of the lowest and most dangerous type. For this purpose her appearance was more an advantage than otherwise. No oath was too loud, blasphemous, or coarse for her to utter; there was no vulgar turn of speech that she ignored, and she was ever ready to greet the most revolting jokes with the heartiest laughter. Her manners were also apparently so loose and low that little restraint was observed in her presence, and her reports forwarded to Scotland Yard were thus rendered all the more valuable. As a monthly nurse she welcomed into the world the children of notorious criminals who were ultimately destined to become her prey, while as a sick-nurse she extracted from her half-unconscious and debilitated fever patients the confession of some dark deed, and hints as to the whereabouts of confederates in crime. Such was the general plan of action observed by this extraordinary woman; but this was rather a slow process, and at times it was necessary to fall at once on the wrongdoer.

On one occasion, for instance, the police received information that there was a gang of false money makers in a certain street; but notwithstanding every effort they were unable to ascertain in which house the coiners worked. The services of the female detective were thereupon requisitioned, and she was despatched to the street in question to see what could be done. After walking up and down a little while she noticed a child come out of one of the houses, whose face indicated a kind disposition. Seizing hastily this opportunity the detective feigned illness, and begged to be taken indoors for a moment. Forgetful of her parent's warning, the child in her excitement, seeing nothing but a woman apparently in great agony, at once and without giving alarm, admitted the detective into the house. The sudden entrance thus obtained enabled the detective to hear the metallic sounds proceeding from the coiners' workshop, before the latter were aware that any stranger was in the house. They were not long in discovering their danger.

Before the detective had time to leave the premises the chief of the gang rushed up from the cellar, where he was at work, and, in his fury, hurled a ladle full of melted lead at her head. Fortunately the poke bonnet that she wore saved her life; the burns she received were not fatal, though they destroyed her hair and its roots. The police arrived in time, on hearing the alarm, to arrest eighteen coiners. The chief, who was first aware of the surprise, was able to escape, but he was subsequently captured in France, and there sentenced to eighteen years' servitude in the galleys. It might have been imagined that if anything could make a woman abandon her particular calling it would be the loss of her hair; but with the detective it only increased her love of what she called sport. She considered that it would now be more easy for her to dress as a boy, and in this, her favorite guise, she penetrated many a thieves' den. On one occasion, however, she was discovered. A brawny thief asked her to speak—that is to say, to give the pass-words and to use certain slang expressions known only to the particular gang whom she was spying. This she was unable to do. The thief then inquired whether any one had seen her enter the house, and, on her answering in the negative, coolly informed her that she would never be seen to go out again. This was the signal for execution, and after brandishing an iron bar, he struck a terrible blow at the detective's head. She had just time, however, to dash her hand through a window-pane and spring a rattle, and the police stationed outside rushed to the rescue. They found the detective lying insensible on the floor, with her skull fractured, and it was been her boast that this adventure cost her fourteen small pieces of bone extracted from the wound. Still

undaunted, and so long as health lasted, the detective continued on the scent, encountering adventures at every step, always in danger, often indulging in hand-to-hand fights, and selecting indiscriminately for her foes both men and women, proving on either her skill in the "art of self-defense." She constantly received subsidies from Scotland Yard, and was armed with the magic whistle, rattle, and number, given her by the authorities, and which insured the assistance of every policeman, stranger or not, whose service she might find it necessary to call for. Sickness at last subdued this turbulent spirit, and the thieves on the Surrey side need no longer fear the visits of the female detective.

CASSIUS, A CYNIC.

L. H. CLEMENT.

CASSIUS was a cynic. A keen, far-sighted man, yet, with all that, he was a selfish, morose fellow. He was a slave to his business, but a tyrant at home. He could be courteous, too, when he saw he could gratify his selfish purposes by it. He flattered Brutus because he expected to be benefited by it. "The learned pate ducks to the golden fool." His logic and his sophisms won him a reputation among his countrymen and purchased for him a place in the front ranks of political demagogueism. But his "lean and hungry look" was against him. He thought too much, and was too silent and surly. His sallow face sent a sensation to the heart of Cæsar that was somewhat akin to fear, and produced in his bosom a wonderful partiality for fat men; those who have sleek heads and who sleep well at night. Cassius was not one of your fiddling, fluting fellows, and he was never seen at a theater in his life. Shakspeare tells us that he scarcely ever smiled at all, and when he did, it was in such a dry-grin sort of a way

"As if he mock'd himself and scorned his spirit
That could be mov'd to smile at anything."

What a surly companion he must have been around a domestic fireside! With no word of kindness for any one, he must have made his home one constant scene of sneers, sour looks and angry speeches. Many, many must have been the sobs and heartaches he wrung from the woman whose very name he dishonored and whom he never addressed save with a growl or a sneer!

Moroseness and selfishness are always inseparably blended. His "itching palm" led him into all kinds of ugly little money transactions with his neighbors. We take it, that by his unscrupulous love for money he filled his own coffers, but, in so doing, brought misery and privation into many a poor man's cottage. Cassius is dead; but he has left his counterparts all over the world. We meet this sallow-faced Cassius at every corner of the street. A snarling monster in the shape of man, who is day by day manufacturing more misery, and causing more heartaches than the drunkards themselves, because this class is more numerous, and then too he is everlastingly growling and making other people unhappy. His home is the home of the cynic. It looks comfortable enough outside, but within there is a deceptive hollowness which bespeaks anything else than comfort. The affections are necessary to brighten any home scene. What little affection he ever had has been given to his money and his business. But there is his wife—where are her affections? Alas, his indifference and brutal words have crushed them out years and years ago!

Everybody abhors and justly abhors the character of a cynic. Yet we all are acquainted with plenty of men who answer the description of one in every single particular, or, in other words, who fill the bill exactly. But it is such a detestable term we are loth to apply it. There is something in his very manner that is forbidding. He is the last person in the world from whom you would expect a generous act of kindness. Somehow or other you don't feel comfortable in his society. You are constantly expecting him to say "good evening," and are heartily wishing he would. If he is not grumbling he is doggedly silent, and by his sullen looks and bitter retorts he checks the flow of other people's spirits. Strangers say he is in good circumstances. His neighbors say he is "close-fisted." Somehow or other you have heard that he stints his family, and that his children have on more than one occasion been publicly humiliated by it.

But the cynic causes most misery where he is best known, viz., at home. How many homes are made wretched by his intolerable ill-temper! How many pale, broken-hearted women there are all around us who are daily trudging on in the position of slaves, trying to brighten the fireside of the tyrant whom they serve and from whom they never receive one word of tenderness! How many daughters are snubbed and sneered at because they are caught looking over the fashion-plates or indulging in some other foolish freak of "girlish nonsense!" And even the little boy who comes down stairs in the morning, with a face radiant with health and happiness, whistling his gay little tune, receives some hard angry word and a short impatient command which at once banishes the tune from his lips and the gladness from his heart. Let us have men about us that are fat, jolly, good-hearted fellows. Away with these chaps who are "of such vinegar aspect,

That they'll not show their teeth in way of smile,
Though Nestor swear the jest be laughable."

Let the next crusade the women undertake be against this Cassius of the home circle. Let the war be waged against all cynics and their everlasting croaking, growling, grumbling, snarling, fault-finding and abominable selfishness.

For Women.

[CONDUCTED BY MISS FAITH RIPLEY.

LOVE'S FLOWER.

Translated from the Russian of Khovansky.

[The infant poetical literature of Russia had its birth but yesterday. In due time it will ripen; and it will then be an interesting task to compare the mature charms of Sclavonic Song with these its earliest years.—Sir John Bowring, 1821.]

WHEN the calm and quiet gloaming
Lit the woodland's tangled bowers,
Through their leafy alleys roaming,
Gathered I Love's votive flowers;

And for one who sways my bosom
Twined a chapel in the grot:
But one sweet suggestive blossom,
Seeking still, I gathered not.

Wandering all that tranquil even
Through the forest's floral ways,
That wee bud, as blue as heaven,
Still escaped my anxious aze.

Disappointed, disenchanted,
Home I wandered through the night;
When, behold! the flower I wanted,
By the rill-side met my sight.

And I learned no more to question,
Weary though awhile my lot,
By that flow'ret's sweet suggestion—
It was Love's Forget-me-not!

[*Maurice Davies.*

THE CARRICK POLONAISE.

AT Fig. 6120 we give the Carrick Polonaise. The addition of the Carrick cape (from which the garment receives its name lightens the stylish effect of the polonaise.

6120

It can be made of any kind of dress goods and trimmed with galloon, folds, or braids. The model here shown is of camel's hair, trimmed with bone buttons and machine-stitching. Price of pattern thirty-five cents. When ordering, please give bust measure.

SOME PICTURE NOTES.

MRS. J. E. S.

To remove photographs from their cards; immerse in warm water, letting them soak until they can be removed freely. Clean warm water does not injure the picture in the least. After being removed, place the photograph upon a sheet of clean paper, and sponge off the surplus water carefully, with a soft linen cloth, from the face side of the photograph. Use linen because it leaves no lint.

As a number of readers of the RURAL seem to have difficulty in obtaining the Flow (a flowing varnish) used in Opaline Painting, I would say it can be obtained of BONTA & CURTISS, Photographers, of Syracuse, N. Y., at fifty cents per bottle, if not of any photographer.

SHALL WE DANCE?

MRS. POTIPHAR.

YES, and why not? But my dear Madam do you not know that there is in progress a crusade against dancing, headed by no less a personage than Mrs. GENERAL SHERMAN and that a famous book has been published in the interests of the crusade entitled "The Dance of Death," and knowing all this, do you advocate dancing?

As for your book, if report speaks truly, I should hesitate before reading so immoral a production, and if by any chance I should read it, I'd be exceedingly shy about making a confession of having done so. I have too much respect for my purity of mind to sit down to such a feast of nastiness. In my opinion a publisher who would issue a work so full of low suggestions and indelicate allusions should be indicted. And Mrs. SHERMAN'S indorsement of the reform doesn't incline me favorably toward it. Far be it from me to go out of my way to disparage a woman, but this one (Mrs. SHERMAN) has been so persistently thrust to the front during this dancing controversy, that I very naturally fell to wondering what manner of woman this was, the mere fact of whose championing a cause is urged as a reason why all should indorse it. I can gather nothing from her public acts that inspires me with any confidence in her judgment or her ability to be a leader among women. Quite the contrary. On two or three occasions she has conducted herself in a manner which reflected little credit on her courtesy or her good taste. Let me instance one. The lady it is understood, considers dancing as highly indecorous, not to say absolutely immoral, and yet whilst holding such extreme views, we find her attending a ball given at Washington in honor of PRINCE ALEXIS, where of course dancing was the most prominet feature of the occasion. But you say she was in a measure compelled by her position to be present. Granted, but does that excuse hold good for her allowing her daughter to attend so "immoral" an exhibition? This same daughter on being courteously invited to dance, rudely refused, assigning as a reason that her Church forbade her indulging in such pastimes.

About as consistent as for a man to hang around a bar-room for four or five hours, and to resent as insults all invitations to drink!

If gracefully gliding to the sound of sweet music is such a ghastly sin, why, oh! why, did the fair MINNIE countenance such naughty proceedings by her presence?

Again; what could possibly exceed the vulgarity of the display made on the occasion of Miss SHERMAN'S wedding?

6120

The mother who would not permit her daughter to dance in respectable society, was quite willing she should make an exhibition of herself in a metropolitan church on the LORD'S day, and be stared at and jostled by a rabble so lost to all sense of decency, that the very priests at the altar had to reprove them for their unseemly conduct. I prefer to weigh questions for myself, rather than blindly follow the leadership of one who has shown herself so conspicuously lacking in the cardinal attributes of a lady!

If dancing is abolished, what is proposed as a substitute? Conversation parties are usually lamentable failures. Cards are apt to suggest and to lead to the milder forms of gambling; and games——well, they are mostly of the osculatory class, and are hardly to be commended as conducive to pleasure or morality. Dancing is a healthful, graceful amusement, and while public balls are perhaps to be condemned, there can be no possible objections urged against dancing at private entertainments, unless it be on the score of late hours.

JOTTINGS FROM MY NOTE BOOK.

CLINTON.

I DO not often read an article which gives me more satisfaction, or which so clearly expresses my sentiments on the subject of which it treats, than does the one on page 329 of the RURAL of Nov. 17, 1877, headed "Two Girls." I would that every female in our land could be induced to read it, and to ponder its lessons well—and to profit by them. No greater mistake was ever made by the young ladies of our country than to suppose that any deformity of their persons that may, for the time, be required by the mandates of foolish fashion, can, by any possibility, render them more agreeable or attractive to the eye or sense of those of the opposite sex whose opinions are of the least appreciable value.

It is most emphatically true, as the writer of the article puts it, that "no man worthy of the name, ever loved or honored a woman because either her waist or her feet were small." Silly, senseless dandies, and artful, designing flatterers will of course *pretend* to be captivated by them, but I would that our females had more sense than to allow the pretended admiration of the classes to which I refer, to govern their action in this or any other matter. I speak with much positiveness when I assert that that form, and those features which the Almighty Creator, in His infinite wisdom designed for woman—His "last, best gift to man," as being best adapted to her position, in rendering her not only most attractive to man, but being best adapted to her use in the proper performance of her varied duties in life—when, I say, this perfect form is, in obedience to the mandates of foolish and tyrannical fashion, distorted and deformed, her natural beauties despoiled, and her bodily health seriously imperiled, if not destroyed for life—then, indeed, a grievous wrong is perpetrated, not only to the individual herself, but to that society which it was intended that she should benefit and adorn.

It is true that any natural defect in the features or form which is noticeable as being a marked deviation from the general rule, may, in some cases, be improved, and perhaps happily corrected. This is surely permissible. Not so any attempt to *deform* that perfect form with which the Creator saw fit to endow the last and most lovely of the works of His creation.

Dec. 3, 1877.

A PRETTY TRIFLE FOR THE TOILET.

LORETTA E. K. TURNER.

TAKE three pieces of Bristol board each nine inches square, and one piece of gilt paper the same size. Pink them around the edges, and make up into cornucopias, using the gilt paper to line one of the white ones. For another one, crochet some zephyr, as a cover for it as near the color of the gilt paper as possible, and use it as a hair-pin receiver.

For the other, use gold-colored silk and make a tiny pincushion, which will just fit in the top of it. Join the backs of them all together and fasten with cords and balls between each of them. The balls for all such toilet articles may be made by splitting common or double zephyr, and winding it over the finger until there is enough for a ball. Then take a needle and stout thread, tie the two ends of the thread together pass the threads around the zephyr after you slip it from your finger, and slip the needle between the threads at the knot. Draw up as tightly as you can and sew through the ball once or twice. Sew the cord fast, and with a pair of sharp scissors, cut the zephyr where it is joined together, and trim into proper shape. The ball looks much more fuzzy when the zephyr is split. This is a much quicker way than to make over paste-board, but unless one is quite skillful the pasteboard is better. Pasteboard balls are made by cutting two rounds of pasteboard, the size you desire the balls, and cutting out the center of them. Place them together and sew them through and through passing the zephyr around the pasteboard until they are filled. Then with a sharp knife cut the zephyr at the edge of the pasteboards; draw a strong thread between them and tie firmly. Pull out the pasteboard and trim. To finish up the triple cornucopia, ornament the fronts of them with embossed pictures. The same style of article is pretty made of black perforated card-board, embroidered around the edge with scarlet and hung with scarlet balls and cord. Very bright or light pictures are required with black foundation.

THE RIGHT TO A LIVING.

GERALDINE GERMANE.

THE writer of a prize article on "Training Girls to a Practical Knowledge of Some Profession or Trade," says, in italics, "A woman has no more God-given right to depend upon her husband for a living than he has to depend upon her for his." What of the women who spend all their time, health and strength in "tending the house, rearing the children," waiting on hired men and making butter and cheese for their "lords and masters?" If they ask for the smallest pittance from their united earnings, the husband "bristles up" and says, "Why, what do *you* want of money! Don't *I* provide everything you need?"

If those who, longing to enter into some other occupation than housework, with a faint hope down in the despairing hearts, that there *will* be *some* way in which they can work at something more congenial, broach the subject to their "lords," they receive the withering answer. "Madam, *I* can find plenty of work for *you*. *My* house is to be kept in order, *my* meals to be cooked, *my* clothes to be cared for, and *you* ought to be glad and contented to do it, instead of sighing for other employment. A woman's place is in the house, working for her husband and children." Or how can those who are "broken down" in the service of their "masters," engage in work of any kind, the more especially as the law denies them the right to the disposal of their earnings?

And, finally, how many women with families, especially farmers' wives, have time or strength to earn their own living outside of their domestic duties? And have not those who toil the hardest, suffer and endure the most, a "God-given right to a living?" or is it only a man-given right?

I wish "A. E. S.," or somebody posted on the subject, would inform me.

The Querist.

ANSWERS TO CORRESPONDENTS.

A. L. W.—Will the RURAL in its answers to questions tell me where I can get a cheap reliable barometer. Is the one advertised as being that used by the Government in the signal service a reasonably reliable instrument? And, is it really used as advertised.

ANS.—The barometer advertised as being used by the Government, is not, we are informed, so used. It is, however, a very fair cheap instrument. MCALLISTER, New York, will supply you with something trustworthy.

Mrs. F. M. B.—I would like to ask if the seed (Geranium) is always slow in germinating. Mine were all the time from the middle of March until June, coming up.

ANS.—This is just our experience. Some will germinate after lying in the ground a week—others not in three months.

S. D. Rathbun, Wrights Co., Ind.—I wish the RURAL would give a description of the European Larch and say whether it would be a good kind of tree to grow on the Western prairies.

ANS.—The accompanying sketch, which was published in the RURAL, several years ago, will give a better idea of the European Larch than a mere verbal description. This is a pendulous variety, though in other respects the same. It is one of the most valuable trees for timber and has been quite extensively planted on the Western prairies with entire success, so far as can now be judged.

J. A. Younge inquires how to fence his flats that overflow every spring. He can do it by making a board and post fence. I use boards 12 feet long, 6 inches broad; bats 3½ feet long 2x3. Nail them about 16 inches from ends of boards and hook them to posts by means of a hook in the post. If there are hard winds two hooks are better. This makes a good fence and is handy, for you can take off a pannel and pass through anywhere.—A. B. B., *Sus. Co., Pa.*

Old Subscriber.—In Women's Department of this issue (Jan. 26) you will find answers to your queries about photographs and opaline painting, under head of Some Picture Notes.

S. T., New Bedford, Mass.—In RURAL of Dec. 22, one of your correspondents, N. R. of Syracuse, N. Y., speaks of setting in black currant bushes. I am very partial to them and would like to learn through the RURAL where I can get a few good ones. I have never seen any advertised in any of the catalogues. Perhaps your correspondent or some other will inform me how to get some.

ANS.—You may send to any nurseryman and he will supply them.

COMMUNICATIONS RECEIVED FOR THE WEEK ENDING MONDAY, JAN. 21ST.

News of the Week.

CONDENSED NEW YORK TELEGRAMS.

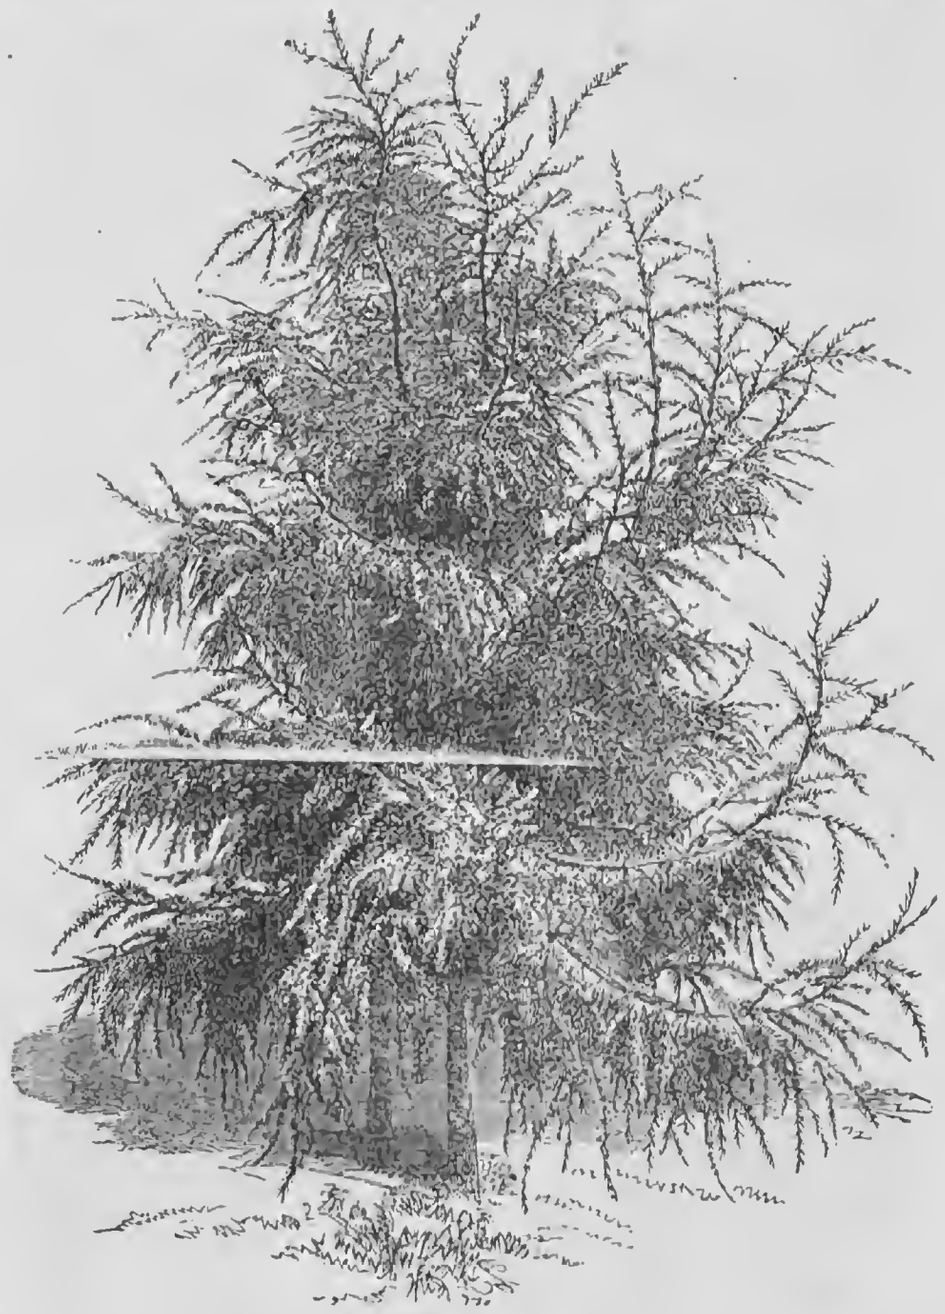
TUESDAY, Jan. 15.—Some of the "boss" shoemakers at Lynn, Mass., have yielded to the demand of their men on strike. The latter have been very orderly, and are hopeful of a favorable issue to the present dispute. Italians all over the country are holding meetings of condolence in honor of the late King of Italy.

French Consuls have been instructed to ascertain the sentiments of the people of Great Britain and Ireland in regard to the Eastern question. Widdin offers to capitulate, the garrison to be allowed to depart with their arms. The Servians have taken Vranja and Gen. Blimarkovich is marching on Prishtina. Server Pasha, Minister of Foreign Affairs, and Namyk Pasha are the envoys appointed to negotiate with the Grand Duke Nicholas. They have been invested with full powers to treat for peace. At least 20,000 fugitives from Roumelia arrive weekly in Constantinople, mostly in a destitute condition.

WEDNESDAY, Jan. 16.—Senator Voorhees made what opponents of the measure concede to have been a very able speech, in the Senate, yesterday, in advocacy of unlimited silver. Gen. McClellan was yesterday inaugurated Governor of New Jersey with such unusual pomp and ceremony that most folks think it a strong hint that an effort will be made to make him Democratic candidate for President at next election.

Erzeroum is an hospital and charnel-house; 100 soldiers die there daily, and two or three are frozen to death every night. The Turkish fleet has shelled Sebastopol and other Russian seaboard towns. The Grand Duke Nicholas has been invested with full powers to make peace. If England engages in the Eastern war, she fears that Germany will seize upon Holland and Belgium and thus secure a seaport in her immediate neighborhood on the Atlantic. Servia insists on making a separate peace, claiming independence, the cession of Old Servia and an indemnity.

THURSDAY, Jan. 17.—Two engines attached to a long train containing about 600 visitors to the Moody and Sanky exercises at Hartford, Conn., broke through a bridge over the Farmington River on the Connecticut Western Railroad, and



EUROPEAN LARCH.

the engines, together with the four cars, plunged into the frozen river. Loss, so far as known, sixteen lives, at least twenty seriously injured and many others, more or less severely. Cause, a culpable weakness of the bridge. Samuel Bowles, editor of the Springfield Republican, and one of the foremost journalists of America, died at his home in Springfield, Mass., at 11 o'clock last night.

Ismail Pasha has offered to surrender Erzoroum if permitted to retire with his troops. A more friendly feeling seems to be springing up between Russia and Great Britain, the former having assured the latter that she will not threaten her interests, and that Constantinople ought not to belong to any great Power; Russia's attitude towards Austria is also conciliatory.

FRIDAY, Jan., 18.—The working men and hoodlums of San Francisco have organized to exterminate the Chinese. The mayor has enrolled a number of special police while the entire military force in the city, has been placed under arms, and several arrests made of the ring-leaders among the conspirators. Ex-Gov. Bullock of Ga., has been acquitted, at Atlanta, of all the charges brought against him.

The Russian loss at Shipka Pass was 5,464 men. If armistice negotiations fail, Turkey will declare a sacred war, and hoist the flag of the Prophet. There is a report of a fierce battle near Philippopolis, between the forces of Suleiman Pasha and the Russians, the former repulsing his enemies, and continuing his retreat towards Adrianople. Since the capture of Shipka Pass, Russia's terms have become severer, and her attitude more independent of the wishes of other Powers. The British Parliament was opened yesterday. The Queen's speech, read by the Lord Chancellor, was of a peaceable nature, and declared England neutral but watchful. Supplies were asked for only on a peaceful basis. The remains of Victor Emmanuel were buried yesterday in the Pantheon at Rome with the greatest honors.

SATURDAY, Jan. 19.—A strong effort is being made to force Secretary of Interior, Schurz, out of office. Geo. Williamson has been nominated Collector of Customs at New Orleans, a place for which ex-Gov. Packard was pressed by Republicans. State Senator John Morrissey has been dangerously sick at Jacksonville, Fla., but is now reported out of danger.

Suleiman Pasha, having with him the Division he brought from Bulgaria, the garrisons of Sofia and other towns up to Nisch, and Chakir Pasha's army, on the 15th, partly burnt Philippolis, which was occupied by Skobeloff on the 16th, since which time nothing certain has been heard of Suleiman, and the Russians under Skobeloff, Gourkha, and others, are closing in from all sides on his line of march. It is said that the armistice conditions are too harsh to be accepted by the Turks. The Turkish envoys and the Grand Duke Nicholas have met.

SUNDAY, Jan. 20.—A strong effort is being made to secure the admission of Utah as a State into the Union. The House Committee of investigation into the Naval Department is of the "smelling order," as no charges have been made, and the members are merely "smelling" about, to find some patriility.

The Russian scouts are in sight of Adrianople, and the garrison, with arms and baggage, are retreating towards Constantinople. Suleiman Pasha has not been lately heard from, and it is feared he may be cut off by encircling Russians. The Porte has issued an Irade, ordering the enrollment of all males. The mortality among Turkish prisoners is awful. The Bulgarians massacred the Turkish peasants who remained behind in the villages within the region abandoned by the Ottoman forces. At Paris, the Geographical Society has given Henry M. Stanley a magnificent banquet, at which all the French celebrities were present, to do the intrepid explorer honor. Specie is flowing from England to this country, $1,000,000 having been shipped yesterday at Liverpool.

MONDAY, Jan. 21.—A vote on Senator Mathews' resolution, advocating the remonetization of silver is expected to be forced in the Senate to-day.

Mouktar Pasha has been appointed to command the army for the defence of Constantinople. Colossal exodus of refugees from Roumelia. Before quitting Adrianople the Turks burned their provisions, and blew up their ammunition. The Russian advance guard have entered the city. An insurrection in Thessaly and Macedonia is fostered by Greece, the latter having just ordered a portion of her army to the frontier. An armistice will probably be signed to-day—(Monday) at Adrianople, as a preliminary to negotiations for peace. The Turkish envoys are said to have full power to settle the terms of peace, despite the expressed wish of Great Britain and Austria to take part in the settlement. As these won't go to war to aid Turkey, she seems resolved to do the best she can independently, having already suffered severely by her reliance on promises or hopes of foreign aid.

HOME NEWS PARAGRAPHS.

Canada mutton is largely used in New York city.

The balance of trade in favor of this country for the last year is $120,000,000.

The wealth of Iowa, equally divided, would give $501,78 to every person in the State.

Horses are fast taking the place of oxen even in the roughest portions of New England.

Pennsylvania supplies one-fifth of the rye produced in this country, or 3,577,641 bushels out of 16,918,795.

The gold product of the Black Hills for 1877 is thus estimated; From quartz, $1,500,000; placer mining, $1,000,000; total, $2,500,000.

When a tramp arrives at Dallas, Texas, he is taken in charge and put to work on a farm which the city has bought for the purpose.

In 1877 there were 1,690 insolvents in Canada with $25,000,000 liabilities, being three millions less than in 1876, when 1,968 merchants failed.

According to the Governor's message, Kentucky owes only about $180,000, and ample provisions have been made to meet this debt on its becoming due.

Of the fifty millions of our population, the ten millions who are heads of families, are taxed less than ten cents a day for the support of the Federal Government.

As a rule the quality of the buckwheat raised in the Atlantic States is much better than last year. At the mills the price ranges from $2.50 to $3 per hundred pounds.

Last year a Chicago dealer failed, among his assets being $600 worth of ice. The marshal kept watch over the estate till it melted away, and then brought in a bill for $674 for doing so.

From trustworthy figures just compiled regarding the liquor traffic, it appears that there are nearly twice as many drinking saloons in New York as in any other State. The exact number is 23,934.

The entire mass of tobacco which is annually consumed in smoking, snuffing and in chewing on the earth is 4,000,000,000 pounds—manifestly too high an estimate for from 1,200,000,000 to 1,500,000,000 of inhabitants.

A correspondent of the Toronto Globe recommends licensing horse-shoers. He takes the ground that thousands of horses are ruined every year by improper shoeing, and that the only way to correct the evil is to license shoers,

Cranberry culture is worth more to Cape Cod than are the fishing and whaling interests, which have greatly declined in the last five years. Cranberries can be easily cultivated by using the proper means, where they are not indigenous.

The Hussey Hill gold speculators intend to make a search for the "Cave of Ninety-nine," which is supposed to be in the Shawangunk mountains. This cave was named after an old Indian chief and is said to contain an immense amount of treasure.

William Black, the celebrated novelist, says of Nebraska:—"The wooden houses were stuck down anyhow on the grassy plain; without any trace of the old-fashioned orchards, and walled gardens, and hedges, that bind as it were an English village together."

The culture of coffee in Southern California is becoming profitable. The plant grows as vigorously as in the coffee countries of South America, and yields a bean of a strong aromatic flavor. The central and southern portions of the State are the regions peculiarly favorable.

Mr. P. T. Barnum writes to a friend that he will undertake no new enterprises. He says he is now sixty-eight years of age, and is doing the work of ten men. He adds:—"I am setting my house in order, and shall be ready to pass in my checks whenever required."

Since the 1st of January last year until the 1st of January this year, there have been exported 102,148,504 pounds of fresh beef at a value of $10,063,302, and of 20,057 head of cattle at a value of $2,987,540, making a total value of beef exported amounting to $13,040,842.

Snook's boy heard him say the other day that there was money in hens, and he proceeded to investigate the old man's poultry-yard. He had gone through a dozen fine specimens when the old gent descended upon him, and the boy now wonders if there is a balm in Gilead.

A California paper says: James English is still at work on the Redwood tree he felled at Russian River Station some months ago. He has already made from it 250,000 shingles, 1,000 fence posts 6,000 stakes, lumber for dwelling house and outbuildings, and has lumber left for 300,000 more shingles. The tree was fourteen feet in diameter.

The expenses of Stanley's great African journeys, just concluded, have been about $115,000, borne equally by the New York Herald and London Telegraph. These expenses have been heavier than those of any previous African expedition, private or governmental, but the discoveries have been more important than those of any other.

Free labor is doing a good deal more for the South, already, than was ever accomplished in an equal time by slave labor. In the eight years preceding the rebellion slave labor produced 28,797,841 bales of cotton; in eight years since the rebellion, from 1869 to 1877, free labor has produced 31,570,212 bales, showing an increase of 2,772,371 bales. During the same time there has been a large increase in the grain production of the South.

The annual reports of the Commissioners of Emigration shows there arrived at this port last year 54,536 alien passengers (or 17,729 less than during the previous year), and 42,685 persons who had previously been in the United States making the total arrivals during 1887, 97,221 persons. Germany furnished 17,753 aliens; Ireland, 8221; England, 6652; Sweden, 3710; Italy, 2832; Bohemia, 2325; Russia, 2391; Denmark, 1801; Norway, 1485; Scotland, 1400; Switzerland 1323, and France, 1121. The following table shows the decline in immigration at this port during the last few years: 1866, 233,418; 1867, 242,731; 1868, 213,686; 1869, 258,989; 1870, 222,179; 1871, 226,639; 1872, 294,581; 1873, 266,818; 1874, 140,040; 1875, 84,560; 1876, 71,265; 1877, 54,536.

Reliable help for weak and nervous sufferers. Chronic, painful and prostrating diseases cured without medicine. Pulvermacher's Electric Belts the grand desideratum. Avoid imitations. Book and Journal, with particulars, mailed free. Address PULVERMACHER GALVANIC CO., Cincinnati, Ohio.

FOREIGN NOTES.

Wrecks on British coasts last year, 3,757.

There are 154 sects in England, six having been added during the last year.

Seventy-nine per cent. of the productive area of Ireland is in grass and forage.

Paris eats a thousand horses every month, and hippophagy is gaining ground in the large towns of France.

It is stated from Belgrade that Russia is paying the Servian Government a monthly subsidy of 1,000,000 roubles.

The amount of sugar annually consumed in Great Britain is 900,000 tons, being about sixty pounds for every one of the population.

The English feed for fattening sheep consists of cotton-seed and turnips. They claim that it will put on the most fat, is the safest feed, makes the best mutton at a less cost, and produces the best and strongest manure.

From 1870 to 1874 the Austrian Government realized nearly $35,000,000 from the public lotteries; the ticket-holders won $16,500,000. In Italy the net receipts of the Government lotteries in three years reached $40,500,000 while the sum won by the people was $20,000,000.

The number of emigrants who left the ports of Ireland during the quarter ending September 30th last amounted to 11,656—6,235 males and 5,424 females—being 1,158 more than during the corresponding quarter of 1877, but 4,379 under the average in the third quarter of the last ten years.

A terrible famine is now desolating the north of China and the Corea, and the inhabitants are dying by thousands. The famine is principally due to a host of grasshoppers which have ravaged the plantations for two hundred miles inland, and the plague has come to aggravate the existing horrors.

Canada is doing an immense business in shipping lobsters to England. Lately one ship from Halifax took $83,000 worth in cans for London, which represents something like 655 000 lobsters, and a few days before a shipment worth $72,000 was made. Frank Buckland is warning the Canadians against thus destroying a fishery that in future years will be even more valuable than now.

Last year there was expended for telegraphs in the countries of Europe, $15,400,000, at an average of thirty-two cents per message. In this expenditure Great Britain led the list, with nearly forty-three per cent. of the whole; France came next, with about twenty-two per cent.; no other country exceeded four per cent. The length of wires in Great Britain very slightly exceeds that of Germany, and is nearly a fourth more than France; in this particular, Switzerland takes the lead of the smaller European States.

M. Gartiaux has published some curious statistics on the dangers of traveling by land in France. He says that in the *diligence* days a man had one chance of being killed in 300,000 trips, and one chance of being injured in 30,000. On the railway between 1835 and 1855, there was one chance of being killed in 2,000,000 journeys, and one chance of being injured in 500,000. From 1855 to 1875, one chance of being killed in making 6,000,000 journeys, and one chance of being injured in 600,000. Now the chances of being killed are as one to 45,000,000, and of being injured one to 1,000,000. Consequently, a person traveling ten hours a day at the rate of forty miles an hour, would in the first period have had one chance of meeting destruction during 321 years; during the second period in 1,014 years; and between 1872 and 1875 in 7,439 years.

Asthma.—Thousands of the worst cases of Asthma have been relieved by using JONAS WHITCOMB'S REMEDY. In no case of purely asthmatic character has it failed to give relief.

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Jan. 19, 1878.

BEANS AND PEAS.—Receipts of beans past week, 5,760 bbls.; Exports, 488 bbls. Medium beans have still no easy lots; round parcels can be had lower. Reasonably cheap potatoes and a mild winter spoils the local demand. In marrows there is some sort of a hitch in exporters, contracts and prices are lower with a diminished demand. Pea beans have declined, Choice White and Red Kidneys are firm under grades easy. Ordinary use will not consume the stock of Black (turtle soup) beans and prices are weak. Green peas are lower $1.30@1.35, but now held with some firmness; Southern H. E. peas are scarce and peddle out at the high figures $3.20 per two bushel bag. Canadian held in bulk and bond have declined to 83@83½c.; some extra in store held higher.

We quote:—Beans, medium choice, $1.75@1.80; other, $1 60@1.65; marrows, choice, $2.15@2.20; other, $1.95@2.05; pea, $1.75@2.00. White kidney, choice, $2.00@2.25; other, $2.10@2.25; red, choice, $2.00; extra, $2 50; other, $2.25@2.35. Turtle soup beans, $1.65. Lima, $3.00.

BEESWAX.—There is a light inquiry from shippers. Sales at 27@28c. for Western and Southern.

Exports past week, 3,950 lbs.

BROOM CORN.—There is very little inquiry.
Green brush at 5@7c.; green hurl, 6@7c.; medium green, 5@5½c.; red-tipped, 4@5c., and common red, 3@3½c.

BUTTER.—Holders of fine butter have the market at their command, as most of the fine State dairies and lots are owned here, and the quantity will not exceed the remaining wants of winter. Our extremes are generally asked, and a class of trade is forced to support them in half-tubs and fine Welsh, or pay the high rates quoted for Western creamery. There is a noticeable improvement in the under grades of butter to this extent only: the really good tubs pickings from some heretofore quiet grades are 24@26c.; stock below that merit continues dull and uncertain. One of the local phases of butter here is peculiar—the times never seem to become hard enough to make the poorer part of the population accept very common stock, regardless of cheap rates. Trade in full dairies has been good, though not more than one or two entires go to buyers these days. It looks like a small business when the old war times are brought into comparison, when a buyer would jump in and take a dozen long lines. Western factory butter is dull, owing to medium quality as much as anything else. Shippers make some offers—generally 2@3c. under sellers' views. Extra fresh Western dairy would bring as much as as a good grade State. Our merchants begin to decline to make advances on any stock of a trashy character. Rolls have accumulated, and are lower. We notice that what ought to be a worn-out deception—putting of old in rolls—is still practiced. This method always makes bad butter worse, in the views of retailers.

We quote State fancy pails 28@30c.; other 25@30c.; creamery, good to choice, 25@31c.; half tubs, fine, 28 30c.; extra, 33@35c.; other, 22@27c.; Fall Welsh 27@29c.; Welsh tubs, dairy, 24@26c.; other, 20 24c.; full dairies, fine, 26@28c.; common, 20@24c.; firkins 20@26c.; poor State, 12@18c.; Western creamery, good to choice, 38@40c.; poor to good 25@32c.; Factory, choice, 18@20c.; good, 16@18c.; common, 7@11c.; rolls, 12@17c.; grease, 6½@7c.

Receipts for the week, 21,950 pkgs.
Exports past week, 15 pkgs.

CHEESE.—Exports for the week have been 21,332 boxes. The market has not changed through the week. Receipts have fallen off, and the impression prevails that the assortments back in the country are limited. Holders of some special factories practically keep them off the market, 13½c. having been refused; the more general prices for average fancy lots are 12½@13½c. Medium or good grades have most attention from shippers just at the moment.

Fancy factories, 13 13½c.; good and prime, 12½@12¾c.; fair lots, 11½@11¾c.; poor, 8@10c.; 7@10c., skimmed. Farm dairy, 12@12¾c. for good to prime; 10½@11c. for fair lots; 7@10c. for skimmed; Western factory, cheddar, 13@13½c. for fine 11@12c. for good; 5@9c. for poor.

Receipts for the week, 21,079 boxes.
Liverpool cable, 61s. 6d. Hold closes 101¾.

COTTON.—There has been a very irregular and feverish market, closing weak.

Latest prices are for January, 11.20@11.20c.; February, 11.23@11.23c.; March, 11.38@11.38c.; April 11.52@11.53c.; May, 11.66@11.67c.; June, 11.79c.; July, 11.84@11.85; August, 11.91c.; September, 11.63@11.65c.; October, 11.46@11.45c.

Quotations for spot cotton are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted.

	Uplands.	*Ala.*	*Orleans.*	*Texas.*
Ordinary	9¾	9¾	9¾	9¾
Strict ordinary	9¾	9¾	9¾	9¾
Good ordinary	10¾	10¾	10¾	10¾
Strict good do	10⅝	10⅝	10⅝	10⅝
Low middling	10 13-16	10 13-16	10 15-16	11 15-16
Strict low middling	11 1-16	11 1-16	11 3-16	11 3-16

Strict good middling	11⅞	11⅞	12	12
Middling fair	12⅜	12⅜	12¼	12¾
Fair	12⅞	12⅞	13	13

Stained.

Good ordinary, 9⅝c.; Strict ordinary, 9¾c.; Low middling, 10¼c.; Middling, 10⅝c.

DRIED FRUITS.—Best sliced and quartered apples have a fair inquiry, and they are at strong prices. Peaches and small fruits generally are quiet.

Apples—State quarters, old, 6¼@6¾c., new, 6¾@6¾c.; Western quarters, old, 6@6¾c.; new 6@6¼c.; Southern, new, prime sliced, 7c.; fair to good, 5@5½c. Peaches—Peeled, new, 11@12c.; unpeeled halves, 4¾ 5c.; unpeeled quarters, 4@4¼c. Pitted cherries, 15@17c. Blackberries, 10@10c. Raspberries, 27c. Plums, 16c.

EGGS.—Receipts for the week, 7,157 barrels. Eggs show a marked decline, and the low rates annexed have been current most of the week; many dealers fear that bottom has not been touched in prices. The markets are full of cheap stuff, and the weather will not give eggs their special demand. Grocers are afraid to stock up heavily enough to make the low figures an advantage. Limed eggs are dull and decidedly lower.

Near points, 17@19c.; State and Pennsylvania, 16@—c.; Canadian 12@15c; Western, best, 15@16c.; ordinary 12@13c.; Southern, 10@12c.; Limed, State, 12@13c.; Canada, 12@13c.; Western, 10@12c.

FEATHERS.—Live white prime Western geese, 45@47c., mixed, 30@40c.

FEED.—Is more freely offered and easier. Sales 40 pounds ave. $20.00@20.50; 60 pounds ave. $19.50@20; 80 pounds ave., $20@21; 100 pounds, $20.50@22; and rye at 19@20.

FLOUR.—Lower prices for wheat, and the expected early termination of the trouble abroad has exerted a pressure to sell, which has led to steadily declining prices. At the close there is rather more steadiness.

Latest prices are $4.25@5.00 for poor to fancy superfine State; $5.10@5.45 for common to fair extra do; $5.45@5.75 for good to choice do.; $4.25@5.00 for superfine Michigan, Indiana, Iowa, &c., outside for choice; $5.00@5.45 for shipping extra do., the inside price for poor, and $5.45@5.75 for good to strictly fancy extra do.; common to choice white wheat extras, $5.75@7.25; fancy do at $7.25@8.25; red and amber winter wheat, good to choice family, at $5.25@7.10; round hoop Ohio at $5.25@5.55, and trade brands of do. at $5.75@7.10, the latter for choice; St. Louis, $5.50@6.25 for poor to fair extra and $6.25@7.50 for good to fancy, (with a few brands of very fancy quality quoted up to $8.00@8.25); Minnesota clear, $5.00@6.50; Minnesota "straight," common to fancy, at $6.00@7.65, and patent poor to very choice, $6.75@9.00, with a few fancy at $9.25@9.75; unsound stock at $2.50@6.25; city mill extra at $6 10@6.35 for fair to very choice for West Indies; do. for England $5.25@5.35; do. trade and family extras, $6.65@7.75; do. South American, $6.60@7.50; No. 2 at $2.50@4.00.

Buckwheat Flour—Quoted at $2@2.60. Corn meal is selling at $3.00@3 for Western yellow and $3.20 for Brandywine.

FRESH FRUITS.—Exports apples past week, 2,900 bbls. The market is strong for prime apples, though few dealers will reap a benefit from the small supply.

We quote Baldwins, $4; Greenings, are firm at $3.75. We shall soon have to draw more largely upon Russets. Selected sorts, $3.50@4; fancy small lots $4.50; fair to good, $2.50@3; common, $2@2.25. Cranberries, have a fair outside call and dealers think the supply will go out well, though city wants are light, the demand being chiefly from bakers. Fancy lds., $5.75@7.50; crate, choice, $2@2.25, good, $1.87; poor, $1@1.62. Grapes have only a special quotation 6@7c. for Catawba. Florida oranges, $3@3 50 box. Speculators are holding peanuts firmly, but there are other sellers at inside rates and the market is not quite so firm under a limited demand, handpicked, $1.60@1.65; $1.35@1.50 for Virginia. Hickory nuts selling better; Texas pecans, 8@10c.

FURS AND SKINS.—There has been little trade in ordinary manufactured goods this season, and that fact alone is a weakening one for the raw stock. Few lots of the latter arrive, with the present unattractive prices, and it is unlikely that European rates will give much stimulation.

	No. 1 quality. Nor. & East.	West & N. W.
Otter, ₩ piece	$3 00@ 4 00	$2 00@ 2 50

Kitts	@ 2	@ 2
Beaver, ₩ ₩	1 00@ 1 25	60@ 75
Raccoon	35@ 45	35@ 45
Opossum	3@ 6	3@ 5
Skunk, black		40@ 45
striped		5@ 20
Wolf, mountain		1 50@ 2 00
prairie		50@ 60

GRAIN.—The impression that the war on the other side is not likely to continue long, and the depressed condition of the general markets there for breadstuffs generally, have led to free offerings, through which a sharp decline in prices has occurred. At the close, the feeling seems to be that bottom has been touched, and prices are steadier and a more vigorous speculative demand.

Latest sales are of No. 2 red at $1 41@— ungraded red and amber State, $1 10@1 37; white, $1 41; No 1 Northwest spring, $1 32; No. 3 Chicago, $1 26½; No. 2 red for January at $1 26; No. 2 Milwaukee spring, $1 34. Rye is a trifle steadier; sales of Western at 71@7 c.; State at 72@77c. Barley, 38c for No. 1 Canada; 36@36c. for six-rowed State. Corn is weak and quiet. Latest sales are of New York No. 2 at 53½@55½c.; steamer mixed, February, 53@55½c. Oats of New York extra white, at 41½c.; do. No. 1, February, 37c.; No. 2 white, 36@36½c.; mixed Western, 37@38½c.; white Western, 33@39½c.

HAY AND STRAW.—Supplies are fair, but demand has quickened, and prices are firm.

Bale hay, 65c. for shipping, and 75@85c. for retail qualities; clover, 40@50c. for prime. Straw, 50@55c. for long rye; 40@45c. for short rye, and 40@45c. for oat.

Exports last week, 100 bales; since Jan. 1, 2,475.

HIGHWINES are lower—$1.09.

HONEY.—Almost too dull to quote. White clover, 2-comb boxes, has sold down to 11c.

HOPS.—Exports for the week have been 2,358 bales. Prices remain unchanged, notwithstanding the stronger country advices.

State choice to fancy, 11@13c.; good to prime, 9@10c.; do., low and fair, 5@7c.; Eastern, new, 8@12c.; Wisconsin, do. 5@8c.; Yearlings, 3@5c.; Olds, all growths, 2@3c.; Californians, 12@14c.

LEATHER.—Hemlock sole, 21@22c. for light, 22@23c. for middle, 22@23c. for heavy, 20@21c. for good damaged.

OIL-CAKE.—Western is lower at $32 ₩ ton.

POULTRY AND GAME.—Live poultry is low; a good deal of trade is stopped by the enforcement of the law upon Jewish buyers, which prevents them from keeping stock on their premises. The market for live can hardly recover while dressed is selling in most cases quite as cheap.

N. J. chickens, 7@10c.; fowls, 10@11c.; Turkeys, 9@10c.; Toms, 7@8c.; Ducks, N. J., pair, 60@$1; Geese, N. J., $1.50@1.62; Western, $1.10@1.25.

Perhaps the hardest market that dressed poultry ever suffered has occurred during the past season. Dealers count upon at least two good days in winter after January sets in; but the light demand thus far leaves a surplus that prevents prices from improving. "Cheaper than meat" fails to rally the large army of consumers, and fine-grained turkeys and bright, fresh chickens are passed by, from day to day, regardless of the remarkably low quotations. Should the weather again become soft, some more large losses will be added to a season already rough enough.

Fancy Phila. and N. J. turkeys, 11@13c.; good, 8@10c.; large or Toms, 6@7c; chickens, choice, 11c.; good, 9@11c.; common, 6@8c.; ducks, choice, 12@13c.; other, 9@11c.; geese, fancy, 10c.; other, 6@9c.

Game has only a chance trade—some days high and then reversed. At the moment supplies are light and prices are firm. No sale for partridges after Feb. 1st. Present prices are better than they were early in the week. Wild pigeons are in stock.

Hares and rabbits, pair, 30@40c. Canvas-back ducks, $1.00@1.25; Red-heads, 75c.; Mallard, 65@75c.; Teal, 50@40c.; Quail, prime, $1.50@1.75; soft, $1.00@1.25. Partridges, pair, 40c.@$1.00. Grouse, 80c.@$1.12.

PROVISIONS.—Hog products generally stronger and active. Mess pork $12.25@13.50 for spot lots $12.20 for January, $12 50 for February and $12.45 for March. Bacon at 6¾@—c. for long clear and 6¾c. for short clear. Lard—Western steam at 7-85c. for spot, 7-85c. for January, 7-87½c. for February, 7.95c. for March. Tallow, 7¾c. for prime. Stearine, 8c. for prime Western. Beef hams at $16.50. Beef—New extra mess, $13@13.50; plain, $11@12.50; new packet, $14.50; family mess, $16@17; extra India mess, $27@28.00 for city brands; do. Philadelphia, $23 50@24.

SALT.—Ashton's at $2.50; Higgins', $2.50 and other sack lots at $1,10@1.15.

SEED.—Grass are lower; clover 8¼@8¾c. for prime, timothy, $1.37½@1.42½. Rough flax, $1.55.

TOBACCO.—Export movement fair, and prices generally are strong.

Ohio assorted lots	8½@12
Wisconsin assorted lots	6½@ 9

VEGETABLES.—Protracted dull trade has weakened the potato market and much of the later trade is at inside rates. Some dealers look for a decline before stock is diminished to expected price-supporting firmness. Few Easterns coming. Onions are steady for choice; some poor stock is being pushed on the market. Cabbages are higher and squash show a large advance.

We quote Peach Blows, $1.75@2, bulk and double-heads. Early Rose, $1.75@1.87; Peerless, $1 25@1.50; Nova Scotia, $1.50@1.75; Sweet, $1.50@2.50. Cabbages, 100, $2.50@4.50; red, 5@6. Marrow squash, bbl., $1.50@2; Hubbard do., $2.00@2.50. Russia turnips, 75@87c. Carrots, 75@87c. Beets, bbl., 75c.@$1.00. Red and yellow onions, $1.25@1.50; white, $1.25@1.75. Celery, doz., 75c.@$1.

WOOL.—The market displays more activity, and prices generally are firm.

Ohio, Pennsylvania and Virginia—XXX and picklock, 48@52c.; XX, 41@46c.; X, 42@43c.; No. 1, 35@46c.; No. 2, 33@40c.; common, 35@37c.; combing, 5@38c.

New York, Michigan, Indiana and Wisconsin—XX, 38@42c.; X, 37@41c.; No. 1, 42@45c.; No. 2, 35@38; common, 31@36c.; combing, 50@56c.

Iowa, Vermont and Illinois—X and XX, 36@40c.; No. 1, 38@42c.; No. 2, 36c.; combing, 48@52c.

LIVE STOCK MARKETS.

NEW YORK, Jan. 21, 1878.

BEEVES.—Receipts for the week, 8,958 head; do. last week, 9,920 do. The droves this week were not so entirely from one section; even Cherokee and Colorado stock were included in the offering. Prices have fallen off a shade since our last; trade has been sluggish, and the lighter supplies came near proving oppressive. Very fine quality has not been largely included in the receipts, but the few extras at the close did not exceed 11c.; from that grade down to prime the range went to 10¾c.; really good, selected stock was thought to be well sold at 10c.; good cattle in wholesale lots, 9@9¾c., the lower price for Colorado and Cherokee; under-grade stock, 8@8¾c. About 500 heifers were held for export from Saturday's receipts. Bulls quoted at $3.70 ₩ 100, live weight; rough oxen, 7¾c.

COWS AND CALVES.—Choice milkers are scarce and high; $75@90 for first-class; a good grade can be quoted $60@65. When cows are below good quality it is difficult to sell them at any price.

VEAL CALVES.—The market is dull and somewhat perplexed by the appearance of "bobs." These are quoted at $2.00@2.25 per head. Two to four-weeks' growth, 5@6c. ₩ lb.; fair stock, 5½@7½c.; prime to choice, 8@8½c. Hog-dressed veal, at West Washington Market, 8½@10½c. Grass calves not wanted; slow at 2½@3½c. ₩ lb.

SHEEP AND LAMBS.—Receipts for the week, 19,601 head; last week, 27,163 do. Colorado sheep are altogether too poor for our market. Ordinary to choice sheep quoted at 4¼@4¾c. A few car-loads of extra sheep held for 5¼@6c. Choice Canadian lambs sold at 7¾c.; other, 5¾@7c.; do. ewes, 5¼c. Market closed dull.

SWINE.—Receipts for the week, 37,813 head; do. last week, 41,420. Market rather steadier than it has been during the week; an improvement in city-dressed helped the tone. Quoted at 4¾@4¾c. ₩ lb.; a few pigs, 4¾c. Country-dressed pork, 5@6c. for heavy to light.

It is the easiest and surest Dye known, and always gives a rich, deep jet black. Give it one trial. Price 25c. Send for book and beautiful samples of colors, free. Wells, Richardson & Co., Proprietors, Burlington, Vt.

TO PRESERVE THE HAIR,
Stimulate its Growth, and render it soft and glossy, use Dr. Jayne's Hair Tonic. This unequaled dressing for the hair, being free from all deleterious substances, exerts a beneficial influence on the scalp, removes dandruff, and in most cases causes new hair to grow.

Reading for the Young.

DARLING'S QUESTION.

"WHERE does the Old Year go, mamma,
When it has passed away?
It was a good Old Year,
I wish that it could stay.
It gave us spring and summer,
The Winter and the fall;
It brought us baby sister,
And that was best of all.
Where does the Old Year go, mamma?
I cannot understand."
"My love, it goes to join the years
Safe folded in God's hand."

"From where will come the New Year,
When the good Old Year is dead?
Now all my birds and all my flowers
With the Old Year have fled,
I do not think that I shall love
This new New Year at all."
"Yes, dear, it too will bring the spring,
The summer and the fall."
"Where will it come from, mamma?
I do not understand."
"It comes from where all coming years
Are hidden in God's hand.

[*Scott Campbell.*

POOR KATE.

BARBARA SEMPLE.

A MORE plain-looking little girl could scarcely have been seen than the orphan niece of the niggardly Mrs. Scatterby. Her complexion was of that sort which never looks clean, her mouth was unusually large, and she had a great quantity of dry sandy-colored hair of so unmanagable a character that it would have required the daily care of a skillful hair-dresser to make it presentable. Kate was clumsy in person too, and her natural ungainliness was further increased by the oddity of her dress, which consisted of Mrs. Scatterby's cast-off gowns. These garments were altered to fit the little girl, it is true; but the fashion in which they had been originally made was retained, it being too great a trouble to alter them in that respect. Thus attired, Kate usually presented so ridiculous an appearance that it was no uncommon thing for her to be followed by a crowd of street boys who mocked her, and even at times threw stones at her. So timid was the little girl, that she had not even the spirit of the proverbial worm that is said to turn on its oppression. At home Kate was a domestic drudge. She was not pretty enough for the parlor, and not clever enough for anything but the commonest work, her aunt said. And indeed every one thought her stupid, because she was crushed in spirit and did not dare to call her soul her own, as the phrase is. Ah, well, what matter whether she dared call it her own or not, so long as it was her own?

Mrs. Scatterby occupied the second floor of a house, and the kitchen in which her despised niece spent many hours of the day overlooked a pretty garden. Here she frequently saw a delicate child carried in the arms of his father. When she opened the window she could hear the gentleman talking lovingly to his little boy. Occasionally he would put him down to look at the flowers. If the little fellow smiled, his father's face brightened; if he coughed or moaned, a look of tenderest pity overspread the face of the fond parent. Other children this gentleman had, and to all he was an affectionate father; but none seemed so dear to him as the little ailing boy. To watch this parent and child constituted the greatest pleasure and perhaps also the greatest pain of Kate's life. She had no remembrance of her parents, nor indeed of any one who had ever loved her. She had no recollection of ever having been kissed. Love was to her a mystery. All dusty and begrimed as she was, she looked down into the beautiful garden at the father and child till a great yearning for an affection she had never known made her cry as if her heart would break. Then at night, when the shutters were closed and the gas was lit, Kate would in imagination put herself in the the sick boy's place and fancy that she was encircled in the arms of a loving father. Oh, how willingly would she have borne any pain for such sweet solace as that.

Usually it was Katie's part to remain at home on Sunday morning and make the dinner for her aunt, who always kept up appearances by going to church. One Sunday morning, however, a slight indisposition rendered her unable or unwilling to observe her usual custom; so she decided to remain at home, and sent Kate instead. In her usual subdued cheerless manner the little girl dressed herself and proceeded to church; and oh! what an odd little creature she looked sitting alone in her aunt's otherwise empty pew.

"Like as a father pitieth his children, so the Lord pitieth them that fear Him," read the preacher.

A change has come over the queer child that sits alone. Her large and old-fashioned bonnet is pushed back, and her eyes, which are beautiful, are fixed intently on the preacher as she listens with awakening hope. Pity is precisely the aspect of love which she has learned to esteem the most divine, and it is hers, if the minister speaks true; and if the book out of which he reads deceive not.

Eagerly she attends to the sermon; for she is most anxious to know what it is to fear the Lord. Ah! now she understands. It is nothing more than the fear of every loving heart, the fear to offend. The ugly face becomes beautiful as it is irradiated first with intelligence, then successively with hope, faith, and love. Joy at length overpowers her. She weeps, she sobs. Then a hand is laid on her wrist and she is led gently out into the churchyard.

"What is the matter, my dear?" asks some one. The voice is pleasant and not unfamiliar. She looks up in the speaker's face, and, to her surprise, finds that she is addressed by the kind papa who walks in the garden with his sick boy. Regarding him not as a stranger, but as a friend, Kate frankly tells how the sight of him and his little boy awakened in her heart a great longing for love which is now satisfied.

"I have a Father who pities me. I used to make believe that I was your little sick boy, and that you were my papa; but I don't need to do that any more," she observes, with a look of heavenly joy.

LETTERS FROM BOYS AND GIRLS.

Another New Cousin.

DEAR RURAL COUSINS—If so a stranger may call you, I have been watching Editor, Grandmother, Cousins, and all, with considerable interest for some time, but "Slayerofconceit," in issue of July 21, brought me to the speaking or writing point. Now "Slayer," don't be frightened—I'll not harm you; but do let me exclaim, "in an oratorical voice," what a good-natured, quarrelsome company of Cousins you are! Hence my wish to join you: not to quarrel, however. For I'll promise to be good, if you will let me in.

Firstly, that naughty Editor goes for that dear old "Grandmother"—says she has switched off the track. Do you not see, she is a very good illustration of the mother she speaks of, who went to church and left the boys? Only "Grandmother," poor old lady, is fretting over all creation, in place of three little boys. Pray don't disturb her, she is improving.

And then comes "Slayerofconceit." How he does pitch into the women! Wonder if he speaks from experience? Oh, my! don't he write as though he had never inhabited anything but a lemon-rind all the days of his short, uneventful life? Speak back, little Cousins, and ADEL W—— in particular. Give him plenty of room, and he will soon complete the business of knocking the conceit out of himself, if out of no one else.

To MATTIE F.'s question, "Where is the command given in the Bible to 'Trim the garments with blue ribband?'" I answer, she will find it in Numbers 15: 38.

What a solemn letter "Solomon Sap" has written on that very solemn subject, "The Oyster!" —HATTIE A., *Chippewa Co., Wis.*

A Touching (?) Incident.

DEAR RURAL COUSINS:—I have just returned to my dear country home to spend my vacation, and with the permission of Mr. Editor, I would like to tell you of an incident that occurred a few days before I left school.

It was on Monday morning and all the largest girls were together in the drawing-room, when Mrs. W., the principal's wife, came in and said, "Girls, I am in a worry this morning. Mary, my washerwoman, is sick, and I know not whom to get to do my washing. All my other help have more than they can attend to, so they cannot do the washing." We all sympathized with her, and asked if such and such a person in the neighborhood could not be procured, when Laura Hawthorn, the loveliest and most advanced pupil in school, and one whom we all looked up to as our leader said, "Mrs. W. I will do your washing for you this week." For a moment there was silence in that room, when Mrs. W. broke it saying, "My dear Laura, you have always been a kind-hearted and intelligent girl, but you have never, no never, made such an impression on my mind and heart, as you have this morning. Since you have entered this institution you have won the esteem of both my family and your school-mates, but this morning by your kind and loving spirit you have taught me a lesson I never can forget." Then, turning to us girls she said, "Girls, this is a lesson for all." It is needless for me to say that the example was not thrown away.—COUSIN MAUD.

Ambitious to be a Dialect Writer.

MR. EDITOR:—With yure purmishun, I will step intu the "Kuzens' Curkle" a moment, to chat with the gurl labeled AMELIA. Du you suppoze the artikle heded "Old Bachelors" (that wuz red by the boys, and laffed at by the gurls,) iz tu be shuved around the curkle unansered? A shout like the rore uv the tempust ansers No! Thare iz, az yu say, wunce in a while an Old B. But it iz hiz own folt. He cood hav been a hen-pecked huzband, with teath nocked out, and his hare komed oph, &c. Thare ar sutch kases. So sez history. But it iz when thay married Old Mades, tho. If Old Bachelors wur invented befour Old Mades, I must say the latter is knot muteh improvment. I cood deskribe wun, but it might raze the ire uv sum uv the gentlur seeks. AMELIA'S Old B. must hav ben "pekulyor." But the trubble wuz, I gess he wuz only flurting, and left hur for sum uther gurl for a change. Hents the terrybul "ink sling" at Old Bachelors in genral. You ma think I am wun; but I am a good-nachured, blu-ide yooth uv nineteen awtums. But, gurls, giv the Old Bachelors fitts if you kan. I hoap yure efforts will be krowned with sucksess. And now, ladiz and gentlemen, I will bid you adoo.—YANKEE BILL.

An Experiment With Cat-Birds.

DEAR MR. EDITOR.—I have not written to the RURAL in so long a time that I hardly know what to write about; but am so anxious to write that I cannot wait longer.

Since my last letter I have been to school and enjoyed it. Am now having my vacation; I study just the same as if I were going to school. I must tell you about my brother's experiment.

My little bird, Nip, died, so WALLIE and BERTIE thought I would like some little Cat-birds. They took Nip's cage and put a nest of young Cat-birds in it, and allowed the mother bird to go into the cage and feed them till they were nearly ready to fly. Then they closed the door and hung them on the porch. Now the mother-bird feeds them through the wires, and we are very careful not to frighten them, and they seem quite contented and happy. If, after a time, they seem discontented, we shall let them go free. Their names are Muff, Puff and Ruff. Your friend,

Otisville, N. Y., Aug. 5, '77. LOTTIE KING.

Rocky Mountain Joe Once More.

DEAR COUSINS:—I think perhaps you will be somewhat surprised to see me back again, thinking I had fled for good; but not so. WILD FERN asks if boys sew with thimbles? I can, for one, and can also do housework and wash dishes as well as any of the girls. I would like to ask WILD FERN what she can do in the line of out-door work, or is she one of the kind of girls that dwell in the parlor, pounding on the piano, while mother is in the kitchen doing the work? I sincerely hope she is not.

One word to A. W. Have the "Murphys" been your way with their blue ribbons? I wear the blue ribbon, and do not drink, chew or smoke. How many of the readers of the RURAL can say the same? I hope all can. I would like to keep up a private correspondence with some of the Cousins.—ROCKY MOUNTAIN JOE.

Tries It Again.

DEAR RURAL COUSINS.—As the editor was so kind as to print my other letter, I thought I would try again. This is a fair, pretty morning and therefore I felt like writing. I agree with Cousin ALLIE about all of you writing oftener, for I like to hear from you all, and get more and more interested in our columns. I think the boys have a rather hard opinion of the girls (especially SLAYEROFCONCEIT, and SOLOMON SAP.) I think they had better look to themselves and not find fault with the girls all the time. I would like to hear from PRAIRIE JIM again. MOLLIE.

Barnesville, Ohio, 1877.

The Puzzler.

HIDDEN BIRDS.

1. WE have lost riches and gems.
2. Pigs wallow in the mire.
3. Do you wear black, Birdie dear?
4. I crave new cider.
5. In yonder wood cockatrice eggs were found.
6. You must go, Adolphe, as Antony is very ill.
7. It is part rid, George, and you hide the rest.
8. She is a fast snip, even in frolic.
9. He bought a game cock at Oolong, China.
10. Do you burn wood, Peckeredge?
11. Papa roqueted his billiard ball.
12. Chuscue Koover is an Austrian.
13. In her dress of blue, Birdie looked sweet.
14. See the thorn Billie got into his throat.
15. Do dogs go mad in winter?
16. You may go, Shaw. Kate has sent for you.
17. Sweet Pet relied upon me.

☞ Answer in two weeks. LITTLE ONE.

ENIGMA.

AN ear-splitting instrument, noisy and loud,
Tho tocsin of troops, the joy of a crowd;
An empty, a hollow, a profitless thing,
Ever storming and staring and blustering.

A scene at "My Lady's"—squeeze, clamor and heat;
A good deal to drink, and but little to eat;
For thus rules stern Fashion—her slaves must obey—
Keep awake all the night, lie in bed all the day.

A part of our system that oft is annoyed
By organs and bands, at street corners employed;
What with bagpipes and banjoes, by violins backed,
'Tis a wonder 'tis not very often quite cracked.

☞ Answer in two weeks. MD.

CHARADE.

As void of my first as the flower in the breeze
She looked as her fingers flew over the keys;
And she wore rings of pearl and carbuncle.
Could she do second than make e'en seraphs despair,
As whole she sang the sweet, heart-touching air,
"Now Tommy make room for your uncle?"

☞ Answer in two weeks. MAY.

BURIED ENGLISH CITIES.

1. SELL only on security; but even then beware.
2. May Roger send over Bob at half-past one with part of the ox for dinner?
3. Tell either Mary or Kate to get the hamper the boy left lately.

☞ Answer in two weeks. D. B.

PUZZLER ANSWERS.—Jan. 12.

ILLUSTRATED REBUS.—Strike while the iron's hot.

DOUBLE ACROSTIC.—Initials, Spring; finals, Season.

Sabbath Reading.

SMALL THINGS.

DESPISE not thou small things;
The soul that longs for wings
To soar to some great hight of sacrifice, too oft
Forgets the daily round,
Where little cares abound,
And shakes off little duties while she looks aloft.

God has sent some below
Who must their all forego,
And at His bidding give their loved, the best;
The lot of some, like thine,
Is small things to resign, [blest.
Yet, if thou giv'st that little, then thou too art

Thou tread'st a lonely way,
Be willing day by day
To give up little comforts at God's call;
That thou may'st ready be
To yield up cheerfully,
When he shall crave thy dearest and thine all'

[*Sunday at Home.*

CYNICISM.

THE Presbyterian is responsible for the following:—To this day the cheapest way in the world to get a reputation for great depth and strength of mind is to set up as a cynic. The method is easy. All that is necessary is to stand off and grumble. In every realm of thought and action we find a large class of people who make this their occupation; and even in the Church there is a prevalent way of looking at and talking about things which plainly deserves to be called cynical. The people who indulge in it (for their evident gusto shows it to be an indulgence) have a profound conviction that the world is "going to the bad"; that vice is rampant to an unparalleled degree; that "the chasm" between science and religion is wider than ever before, and that almost everybody is on the wrong side; the Church, especially in other denominations and foreign countries, is corrupt and renegade; that missions do not seem to do much good, and that total depravity has risen to the top in every one except themselves.

They look back and sigh for the good old times, or they look forward to some "golden year"; and, lost in reverie, forget the work which alone can transform the present into that higher future. The cynic exclaims, with Hamlet:

"The time is out of joint; O cursed spite!
That I was ever born to set it right,"

and then sit down to wait for some great opportunity, some revolution, in which he may become the savior of his country, or the reformer of his Church. The future may bring some such grand mission; for the present he will content himself with dignified growling.

Constant carping and disgust with the world react on the soul, and stiffen it into dead misanthropy. Contempt for humanity is fatal to that spirit of charity which implies and vivifies all good works. For this reason it is true that people who are always moaning or snarling about the dreadful state of things in the Church are the last ones to take part in any labor to make it better. Take, for example, those who are so very cynical on the subject of the Church's neglect of the poor; how many of them are willing to do mission work of any kind, or to welcome some ragged brother to their comfortable seat in the synagogue?

THE SALVATION OF SOCIETY.

As of every species, depends on the maintenance of an absolute opposition between the *regime* of the family and the *regime* of the State. To survive, every species of creature must fulfill two conflicting requirements. During a certain period each member must receive benefits in proportion to its incapacity. After that period, it must receive benefits in proportion to its capacity. Observe the bird fostering its young, or the mammal rearing its litter, and you see that imperfection and inability are rewarded; and that as ability increases, the aid given in food and warmth becomes less. Obviously this law, that the least worthy shall receive most, is essential as a law for the immature; the species would disappear in a generation did not parents conform to it. Now mark what is, contrariwise, the law for the mature. Here individuals gain rewards proportionate to their merits. The strong, the swift, the keen-sighted, the sagacious, profit by their respective superiorities—catch prey, or escape enemies, as the case may be. The less capable thrive less, and on the average of cases rear fewer offspring. The least capable disappear by failure to get prey, or from inability to escape. And by this process is maintained that average quality of the species which enables it to survive the struggle for existence with other species. There is thus, during mature life, an absolute reversal of the principle that ruled during immature life.—HERBERT SPENCER.

A LITTLE CHILD SHALL LEAD THEM.

THE Rev. Dr. Milnor was brought up a Quaker became a distinguished lawyer in Philadelphia, and was a member of Congress for three successive terms. Returning to his home on a visit during his last Congressional session, his little daughter rushed up to him exclaiming, "Papa, papa, do you know I can read?" "No," he said, "let me hear you." She opened her little Bible and read, "Thou shalt love the Lord thy God with all thy heart." It was an arrow in his own heart. It came to him as a solemn admonition, "out of the mouth of babes." God's Spirit moved within him. He was driven to his closet, and a friend calling upon him found he had been weeping over the "Dairyman's Daughter." Although forty years of age, he abandoned politics and law for the ministry of the gospel. For thirty years he was the beloved rector of St. George's church, in Philadelphia, the predecessor of the venerated Dr. Tyng.

PERSONAL ITEMS.

Bismarck says if Turkey is the sick man of Europe, England is the sick woman.

The wedding presents made to the Duke of Norfolk cannot be worth less than $5,000,000.

If Pope Pius IX. lives until next June, he will have reached, according to tradition, the years of the Pontificate of Peter in Antioch and Rome.

Darwin's father and grandfather were atheists. The grandfather had a seal engraven with the legend, "Omnia ex conchis"—everything comes from shell-fish.

Carlyle is a moderate eater, rarely exceeds two glasses of wine daily and smokes a clay pipe. He is eighty-three years old, and his tall form is but little bent when he walks.

Gen. John O'Neill, who led the Fenian incursions against Canada at Fort Erie, Ont., in 1866, and at St. Albans, Vt., in 1870, died in an hospital at Omaha, on the 8th inst.

Gen. Cushing is in his seventy-ninth year. He entered Congress in 1835, during Jackson's presidency, and is one of the very last survivors of the first-class men of those times.

Senator Beck of Kentucky is very large and has crisp, curly hair. He shows his Scotch derivation in temperament and expression. He is solid, square-cornered and emphatic.

Senator Rollins of New Hampshire looks dyspeptic, and probably is. Most of the New England Congressmen are inclined to stomach weakness from lack of care in their diet, and also because of their excessive mental activity.

The incomes of the leading surgeons in London are enormous. Sir Henry Thompson performs the operation of lithotomy ninety times a year, on an average. His fees range from $1,000 to $2,500, and amount to about $150,000 per annum.

Prince Iturbide of Mexico, the adopted son of the Emperor Maximilian has just sailed for England, to become a military student at Woolwich. He is a clever, intelligent young fellow of fifteen, and seems perfectly able to take care of himself.

Baron Rothschild rides to his business in the omnibuses, and recently presented to each of the drivers and conductors of one of the London lines a hare, a pheasant, and a bottle of wine in testimony of his appreciation of their courtesy and good conduct.

A Madrid special says Don Alfonso is to be married to Princess Marie Mercedes on the 23d, by Cardinal Wavarette. Ambassadors from England, Germany, France, Austria, Belgium, Denmark, Sweden and Norway will be present, but neither Italy, Portugal nor Russia will be represented.

Mercedes, future Queen of Spain, will be one of the most beautiful sovereigns in Europe. She is a very pretty young woman of the pure Spanish type, with very black eyes and hair, fine features, and a full figure. She receives from the Duke de Montpensier, her father, a dowry of $5,000,000, a great quantity of diamonds, and a magnificent trousseau.

The relative wealth and income of the three most opulent men living—the Duke of Westminster, Rothschild, and Mr. Mackey the Bonanza King—have been reduced to gures as follows:

	Duke of Westminster.	Rothschild.	Mackey.
Capital,	£16,000,000 00s.	£40,000,000	£55,000,000
Per year,	$80,000 00	2,000,000	2,750,000
Per month,	60,000 00	170,000	200,000
Per day,	2,000 00	5,000	7,000
Per hour,	90 00	200	300
Per minute,	1 10	4	5

SENATOR CONKLING, when at college, is said to have had manners so reserved that they provoked his fellow students to tease and torment him. He was then a tall, slender youth, and not strong, and feeling his inability to protect himself properly, he quietly procured a teacher in the art of self-defense, and soon became an expert boxer. After he had held a few emphatic interviews with divers aggressive students, they concluded it was the better part of valor to let him alone, and he finished his college course with no more molestation.

"Mark Twain," whose real name is Samuel L. Clemens, is a man of middle hight; solidly built, but not stout; his features are all of a clear massive modeling, and the prevailing expression seems to be resolute courage and determination. His upper lip is covered with a thick brown mustache, and the broad territory of his forehead is usually encroached upon by his brown curly hair. His eyes are small and keen, but are by no means lacking in kindliness and humor. In his whole bearing there is a frank cordiality which is very winning.

The new King of Italy, upon whose head the crown has fallen, is in his thirty-fourth year. He proved himself a good soldier in his early manhood. He has the reputation of being highly educated and naturally intelligent. Married to his cousin Margarita, who is now twenty-six years old, and one of the loveliest women in a land of beauty, he is moral and domestic. His patriotism has always been a marked characteristic, and his basis is what in a sovereign is called "determination," while in a subject it is known as "obstinacy."

Longfellow has five children. Onslow, the eldest, is married and a man of business in Boston; Ernest is a rising young printer studying abroad. Alice, the eldest of the girls, is a pleasing writer, unincumbered by matrimonial bonds; Edith is a golden-haired young lady of twenty-five, who has just united her life with that of the third son of the noted Richard H. Dana Jr., and Anna is another who leans to the pen of the authoress rather than to a penchant for conjugal felicities. The mother of the great poet's household died long ago.

PARTICULARLY

FOR THE LADIES!

THE RURAL NEW-YORKER, at the instance of Miss FAITH RIPLEY, conductor of the Department "For Women," offers, as one of the most valuable and acceptable Premiums of the season, a Steel-Plate Engraving, size 24x32.

The subject,

"OUGHT AND CARRY ONE,"

portrays a pretty young girl, gracefully poised, and holding pressed against her side, a slate on which she is "doing sums." The contracted brow, puzzled expression and drawn corners of the mouth, express most comical dismay.

This charming picture is printed from a new plate, the lights and shadows are clearly defined, and this work of art, when nicely framed, is a decided ornament.

Nothing is more refining and elevating than *good* works of art, and we confidently proffer this as something greatly in advance of anything heretofore announced.

We anticipate that this offer will appeal especially to our lady readers, and in order that the picture may be placed within the reach of all, we have scaled the club so low that it partakes more of the nature of a gift than a premium.

5 SUBSCRIBERS AT $2 EACH,

will entitle any one to the Engraving.

For specimen copies and outfit for canvassing, address

RURAL NEW-YORKER,
78 Duane St., New York.

Implements and Machinery.

Switzerland to America Greeting.

The Centennial Judges having awarded to the Messrs. BOREL & COURVOISIER 2 Prizes at the late Centennial Exhibition for their production, one for extreme accuracy in adjustment and regularity in performance, and the other for Watches at a great reduction from display, they are now offering their improved machinery, whereby the former prices, having introduced cost of manufacture greatly reduced, and the production is increased, and the quality improved, insuring a first-class and durability NICKEL MOVEMENT WATCH within the reach of all. These Watches, so favorably known for the past 18 years, are made of the best material, and have all the modern improvements in watch making having **Chronometer Balances, Breguet Hair Springs, Tempered, Hardened and Isochronised for R. R. Travel, Fine Ruby Jeweled,** and are warranted to perform with the regularity and accuracy of a Chronometer. These Watches are for sale by all our local agents throughout the country, and parties desiring a good and durable time-keeper, are requested to examine them before purchasing those of other manufacturers or home productions.

It is a mistake to suppose that any department of a paper may be slighted. The most important information is to be found, at times, under the guise of an advertisement; and it is agreeable to the advertiser and a courtesy to the publisher to mention the source of your information—in other words, to mention the paper.

Wit and Humor.

EXPLANATIONS.

At church I sat within her pew—
O pew!
But there I heard
No pious word—
I saw alone her eyes of blue!

I saw her bow her head so gracious—
O gracious!
The choir sang,
The organ rang
And seemed to fill the building spacious.

I could not hear the gospel law—
O law!
My future bride
Was by my side;
I found all else a mighty bore.

And when pealed forth the organ's thunder—
O thunder!
I fixed my eyes
In mute surprise
On her whose beauty was a wonder.

To me that maiden was most dear—
O dear!
And she was mine—
Joy too divine
For human words to picture here!

Her love seemed like a prayer to bless me—
O bless me!
Before she came
My life was tame;
My rarest joy could not oppress me.

The service done, we sought the shore—
O shore!
And here we walked,
And sadly talked—
More sadly talked than e're before.

I thought she was a type of goodness—
O goodness!
But on that day
I heard her say
Plain words, whose very tone was rudeness.

We strayed beyond the tide-mill's dam—
O dam!
She jilted me,
And now I see
That woman's love is all a sham!—[*Hawkeye.*

SPARKS AND SPLINTERS.

A sweet thing in combs—honey.

A YANKEE belle remarks that "Boston girls are not so well educated as the boys, but they know more."

NEVER write letters to a widow. She always takes down the old box and compares yours with the other man's.

LET the whirligig of time spin and spin until it creates a hat box, and it cannot bring the hair trunk into fashion again.

IN Switzerland donkeys have bells on their necks. In this country it is not unusual to see them with belles on their arms.

HAWTHORNE says: "We live in dead men's houses." Perhaps we do; but isn't this preferable to dying in live men's houses?"

GUM camphor placed around the haunts of mice will drive them away; before going they sing in chorus: "O, gum, gum away."

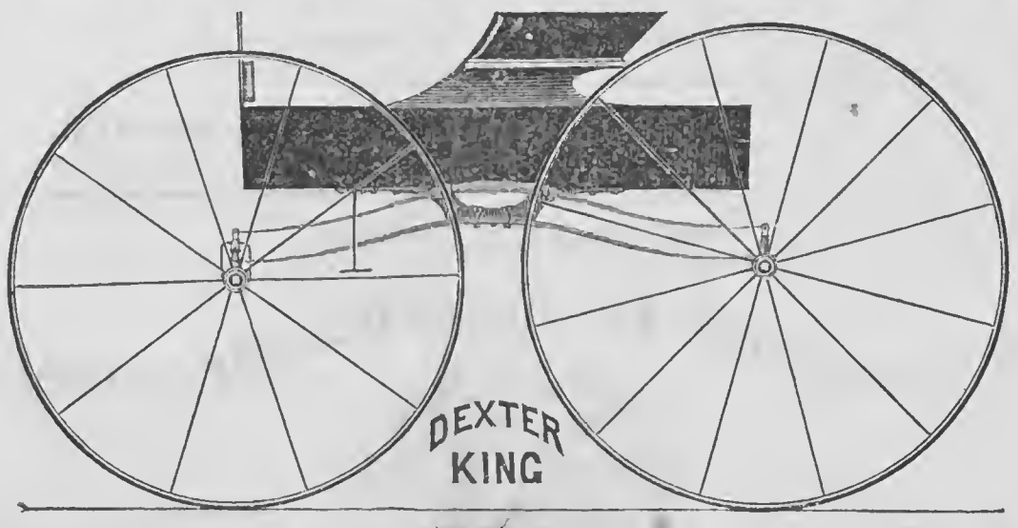
FOND PARENT to a son.—"What's the capital of New Jersey?" Son.—"Hain't any. They've spent it all for quinine!" (Sensation.)

ELNORA—Both of your poems are wrong in metre, and we think that you will discover that two wrongs don't make one write—poetry.

A PRECAUTIONARY MEASURE.

"Now go to School, and be a good Boy. And mind you, don't use any rude Words!"
"Rude Words! Tell me a few, Mummy, and then I shall know, you know!"

The Celebrated Dexter Spring



COMBINES

STRENGTH, DURABILITY AND COMFORT,

At Moderate Cost.

THE SPRINGS FORM THE REACH OR COUPLING.

The Dexter consists essentially of two "concord" or side-springs upon each side of the Buggy, one spring above the other and parallel to it. The two springs are rigidly attached to each other at their centers, and are pivoted at their ends to spring shackels above, or on either side of axle and head block.

TO PUBLISHERS.

THE RURAL NEW-YORKER has accumulated a very large number of desirable Wood Cuts, Electrotypes, etc., representing illustrations that have appeared in this journal from time to time. We have had numberless inquiries from publishers, asking our terms for such cuts as were desirable to them; but we have never, until the present time, had them arranged in a manner that made them easy of access for reference.

We are now prepared to fill orders for these Cuts, and as we do not care to do more than secure a part of the first cost of the pictures (having used them once), we shall make the prices very low. Similar Cuts cannot be bought in New York for less than 20 cents per square inch, and from that price ranging up to 50 cents, according to the quality of the work.

We now offer any Illustration appearing in the RURAL NEW-YORKER, at the following price, delivered in New York:

TEN CENTS PER SQUARE INCH.

All expenses of postage or expressage must be borne by the purchaser.

FLOWER PICTURES.

Not only does the living substance of flowers, bright, variegated, and odoriferous, in the garden, the greenhouse, the window, or the bouquet, afford a refined pleasure to the taste and senses, but even their counterfeit presentment in paintings and engravings, possesses a peculiar attraction. Besides the satisfaction arising from a fine representation of an exquisite object, the pleasure produced by such pictures is probably due, in part, to an often unconscious sense that by this means, those floral charms proverbially almost as fleeting as the sweet strains of music, have been in a great measure perpetuated.

Frequent as are such sources of pleasure to-day, it is less than a couple of centuries since flowers were considered to be in themselves unworthy of the limner's subtle skill. The artists of Holland, influenced doubtless by the love of gardening universal in that country, were the first to paint these living jewels for their own sake, for their beauty of color and their natural graces.

In the art schools of Italy, France and Germany, it is true, flower-painting had previously been skillfully practiced, but almost exclusively as an agreeable adjunct to some other work, to which the flower-feature was quite subordinate. However graceful the grouping, free the penciling or harmonious the coloring of floral treasures, their introduction was always either as a foreground of a picture, an enrichment in colored decorations, or as a pleasing feature in ornamentation of the panels, walls, or ceilings of rooms.

Among Dutchmen, Jean van Huysum—who was born in 1682 and died in 1749—was the first to gain a European reputation for his treatment of floral compositions, and especially of roses, for which he cherished a warm partiality. Brought up among artistic decorations, his love of flowers was founded on a pure worship of Nature which he strictly copied in all his labors. Although previous flower painters in their decorative treatment, were in the habit of arranging their floral groups with artistic symmetry, van Huysum disdained such conventionalisms, and never tried to add a grace of his own to the profuse groups of gorgeous flowers which he was accustomed to depict just as they were gathered early in the morning, with the dewdrops still sparkling upon them. In our present illustration of one of the finest of his floral groups, the artist has not sought to trim, and balance, and guide, but to reproduce purely and simply, and free from all fanciful elegancies of mere art. Roses, Auriculas, Larkspurs, Carnations, Hyacinths, and Tulips, are blended gracefully together just as they were plucked, without any attempt at artistic composition. Insects, birds'-nests, and other objects associated with gardening, were also lovingly treated by the cunning pencil of this charming artist, and frequently introduced, as in the present instance, into his floral representations.

ROSES, POPPIES, CONVOLVULUSES, TROPÆOLUMS, Etc. — AFTER VAN HUYSUM.

BULBS FOR THE FLOWER GARDEN.

W. C. L. DREW.

SCILLAS.

What can be more charming than the handsome, delicate little Scilla? They are the hardiest, prettiest, and brightest of any of the spring-flowering bulbs with which I am acquainted. I have grown nearly all the varieties of spring bulbs, and I would part with none with more regret than with the Scilla. They are all hardy on this coast. In the Northern States, I believe the variety known as S. Peruviana, will not succeed in the open ground; but with this exception, they are well adapted for open ground cultivation in the North and East.

The Scillas commence to throw up their spikes of bloom as soon as the frost has left the ground, many of them blooming before their leaves appear. Each bulb produces from three to five spikes, one after another, thus prolonging the flowering season for many weeks. The flowers are produced on spikes or racemes, of from six to twelve florets each. Their general hight is six inches, although in good soil I have had them grow ten inches. In color we have them in many shades of blue and pink, also in pure white; in all the shades, they are delicate and pleasing to the eye.

CULTURE.

In planting these bulbs, it will be found to give the greatest satisfaction where a dozen or more of each color are planted in clumps. The bulbs in nearly all the varieties are small; in shape they differ in the several varieties. Plant in October or November, in light, rich loam, setting the bulbs never more than two inches deep. To obtain a good display, set the bulbs one to two inches apart. With few exceptions, the leaves do not appear until the blossoms have withered: they should not be bruised or cut away or the future blooming of the bulb will be greatly injured, if not totally destroyed—at least such has been my experience.

VARIETIES.

Of the Scilla there are over fifty quite distinct varieties in existence.

S. Siberica is a perfect gem; it is also known as S. amœna; it grows six inches high, and is in color the richest, shining metallic blue. It is the earliest of the family to bloom, blooming with me in March.

S. Peruviana is very handsome. For house culture in pots, they are charming; they are in two colors; S. P. cœrulea, rich blue, and S. P. alba, snow-white.

S. campanulata has pretty flowers, in shape like Canterbury bells. Of S. campanulata we have 12 varieties:—S. campanulata, a deep, rich blue; S. c. alba, pure white; S. c. compacta, white, with very dwarf, compact spikes; S. c. carnea nova, a pretty, flesh-colored variety, with close spikes; S. c. corymbosa, pure white—flowers in a corymb-like spike; this variety has a very large bulb, over two inches in diameter; S. c. hyacinthoides in four colors—white, blue, rose, and crimson—is very pretty; S. c. major is a dark-blue flowered variety of good growth; S. c. minor is the lowest growing of the Scilla, sky-blue color. The S. campanulata blooms

in March, and keeps up a succession of bloom to the warm days of June.

S. bifolia is among the early flowering varieties, blue, with a purple tinge.

S. cernua we have in four colors—rose, crimson, deep-blue, and a lighter shade of blue.

S. Japonica is reported to be an extremely fine, new variety. I do not know it; does any of the RURAL readers? [We do not.—EDS.

El Dorado, Cal.

SEED EXCHANGE.

EDS. RURAL:—Wishing you a Happy New Year and much success to the old RURAL, of which I have been a reader for many years, I will permit you to make known the following offer, and agree to stand the consequences:

Having saved a quantity of a few choice strains of flower seeds, greatly in excess of my individual needs, I will be pleased to send a small package to any lover of flowers who may be a subscriber to the RURAL, provided he sends to me a post-paid addressed envelope.

Milan, Ohio. W. B. DIMON, JR.

Horticultural.

DISEASES OF APPLE TREES AND FRUIT.

PROF. THOMAS J. BURRILL.

THE outline given below of the diseases and injuries, to which the apple, in tree or fruit is more or less subject, may not be scientifically arranged, nor altogether correct, as it certainly is not fully comprehensive; but it will serve the purpose of convenience here sought, and will aid in an appreciation of the numerous ills that these orchard trees are heir to. Thanks to the vigor and hardiness of the fruit in spite of such a struggle for existence, we still gather, and may hope to gather, choicest sun-blushed treasures, and richest golden harvests. This formidable showing, luckily for us, does not augment the number of, or increase the danger from, diseases, though it may open our eyes to thus take in at a glance the hazardous gauntlet through which tree and fruit have to run.

If desirable in any way, it would be manifestly impossible, in such an article as this, to enter into detail upon all or upon any considerable number of the subjects here indicated. None are new. Each and all have in various places and divers ways been discussed. Causes have been assigned and remedies proposed, hence, it may be, the less need of treatment now. Indeed, an apology is here made, for venturing to the length of this paper without more of the sweet and peculiar flavor of the fresh and the original, yet, unless distinctly mentioned to the contrary, no statement is made at second-hand. Right or wrong as these statements may be, they are all founded upon personal observation and experiment, though no one can be more conscious than the writer of the necessity of very much further investigation.

OUTLINE OF CLASSIFICATION.

Diseases and injuries caused by

I—MAN—1. By improper planting and improper cultivation. 2. Injudicious pruning. 3. Ignorant selection and propagation. 4. Willful or irresponsible trickery and fraud.

II—HARMED ANIMALS.—1. Rabbits: gnawing the bark. 2. Rats and mice: gnawing the bark. 3. Stock, cattle, horses, &c., breaking and otherwise injuring the trees, tramping the soil, &c.

III—BIRDS,—4. Sapsuckers (Sphyrapicus varius): pecking rings of holes in bark of trunk and branches.

IV—INSECTS (*a*) ON ROOTS.—1. Apple-root plant-louse (Erisoma pyri): forming potato-like swellings upon, and finally causing decay of the roots. 2. White grubs (Lachnosterna fusca, &c.): cutting off small roots and gnawing the bark from larger ones. 3. Seventeen-year cicada or locust: sucking sap from roots and afterwards boring the twigs to deposit eggs. (*b*) ON TRUNK AND BRANCHES. 4. Flat-headed borer (Chrysobothris femorata): boring under bark, then deep into wood. 5. Round-headed borer (Saperda bivittata): boring from near the beginning in the wood, usually near or below surface of the earth. 6. Bark lice (Aspidiotus conchiformis and Harrisii): scale insects sucking sap. (*c*) ON LEAVES. Far too many to be enumerated here. The following are the more commonly injurious. 7. Canker-worms (Anisopterix vernata): often in great numbers and entirely defoliating the trees. 8. Tent caterpillars (Clisiocampa Americana): making webs in the trees and eating the foliage. 9. Fall web-worms (Hyphantria textor): same damage as preceding, but appearing later in the season. 10. Leaf-crumpler (Phycita nebulo): rolling balls of leaves which are tightly fastened to the twigs, feeding thereon and transforming therein. 11. Handmaid moth (Datana ministra): collecting in companies, but without webs, feeding on leaves. 12. Tarnished plant bug (Phytocoris linearis): piercing swelling buds and tender leaves (and probably fruit) causing peculiar black patches and death. 14. Plant lice (Aphidæ): leaf hoppers and mites: causing, by sucking or otherwise, a yellowish, sickly appearance of the leaves. (*d*) ON FRUIT. 15. Codling moth (Carpocapsa pomonella): "worms" in and around the core, causing many apples to fall prematurely and spoiling others. The scientific names here given are not all such as a punctilious entomologist would give but are those best known.

V—FUNGI.—1. White mildew (Erysiphe communis and a Phylactina): especially on seedlings, but often on twigs of older trees, causing leaves to drop or wither, and young stems to decay. 2. Leaf scab (Roestelia lacerata): causing blistered and discolored spots ultimately swollen or thickened, and slow death to leaves. 3. Black mold (Spilocæa pomi, &c.): forming dark cloudy patches on the skin of the fruit, very common; associated with other species on the leaves and twigs; possibly causing twig blight. 4. Fruit scab (Malanconei): burrowing beneath the epidermis of the fruit, and slowly enlarging the discolored scar, with distortions of growth. 5. Fruit rot (Penicillium and Mucor species): usually following bruising, breaking of the skin, as by the "scab," insects, &c. 6. Rotten root (Polyporei): a more or less felted whitish envelope causing disease and decay of roots, probably spreading from rotting wood. 7. Leaf blight (Sphæriacei): causing spots on leaves in which may be noticed minute conical black points, the leaves often prematurely dropping—different from the white mildew previously mentioned. 8. Bitter rot, probably.

VI—CLIMATIC INFLUENCES.— (*a*) 1. FROSTS. Winter-killing by hard freezing under certain conditions of growth, ripeness, &c., usually first affecting the heart wood. 2. "Sun scald." Freezing of cambium, especially of leaning trunks, after being started to grow by the heat of sun's rays. 3. Winter-killing of flower or leaf buds by intense cold. 4. Killing of flowers, &c., by late spring frosts. 5. Ice freezing on branches and breaking by weight or otherwise injuring buds, &c. (*b*) HEAT AND DROUGHT. 1. Exhaustion by over-evaporation. 2. Destruction of root fibers. 3. Prematurely checking growth. (*c*) WINDS. 1. Breaking tops. 2. Loosening roots. 3. With wet preventing fertilization of flowers. 4. Shaking off fruit. (*d*) RAIN AND CLOUDS. 1. Weakness from over-absorption and want of assimilation. 2. Tendency to fungus growth.

VII—SOIL AND SITUATION.—Too wet or too dry, too rich or too poor, too little or too much shelter, too flat and level, or too much inclined and bad exposure.

VIII — CONSTITUTIONAL PECULIARITIES. — 1. Not "hardy." 2. Want of root development. 3. Want of foliage development. 4. Want of flower development. 5. Want of fruit development. 6. Tendency to over-fruitfulness.

This list, long as it is, might, without doubt, be considerably extended; but, for the most part, such additions would be correlatives of those mentioned, as indeed it may be noticed, some of these are of each other. Leaving any omissions that may have been made, we turn to examine a few of the topics suggested.

An interesting inquiry, and one worthy of attention, is the injury man himself often does while meaning to benefit or improve. When results are not directly traceable to their cause, such well-intentioned but mistaken effort is much more liable to occur. Learned and conscientious physicians, not long since, drew blood from patients in the hope to cure, but really, in many cases, by so doing, helped to kill. Under the impression that the trees were "bark bound," men have ruthlessly slit the covering of the trunk from top to bottom, and seeing the cut gaping wide from the shrinkage of the tissues, the diagnosis is considered sustained and the savage treatment vindicated. Had they noticed that all such slits, even more markedly in the healthiest trees, were followed by the same results, and especially had they bethought themselves that this shrinking is a necessary consequence of the fundamental laws of structure and growth, the demonstration would not have appeared so satisfactory. It is, however, more surprising to see the process recommended in a recent publication by one who is supposed to know something of vegetable physiology. The fact is, cuts and wounds are serious things, and should be avoided except for well-considered reasons to the contrary. Selecting, in our first division, only the second topic, a few words are offered in regard to pruning, considered with reference to the healthfulness of the tree.

Shortening in the tops at the time of transplanting is generally beneficial for the purpose of reducing the leaf surface and thus preventing undue drying of the tissues before the roots are able to supply an abundance of water; but as leaf buds are mostly on the twigs of the last year's growth, uniformly shortening these is much better than cutting here and there large limbs. Aside from this, until trees become quite old, it is best to limit pruning to securing proper hight of head and proper shape, and this by attention to the young trees and small limbs. If much pruning must be done, see to it that it is before the buds expand, that wounds are not horizontal, and that large ones, if any, are painted or varnished. Beware of severe "summer pruning to induce fruitfulness," and put up with a little difficulty in gathering fruit rather than sever large limbs. Beware also, of root-pruning by spade or plow, and remember that the roots of thrifty apple trees, forty feet apart, soon occupy the whole ground. An enthusiastic advocate of root-pruning, as a preventive of the "fire blight" of pear, directed the operation in several orchards some years ago, giving such a shock to the trees that they have never recovered. Under some conditions the injury was not fatal, even good results may have followed; but the general effect was bad, only bad. It was fashionable at one time in Illinois to ridge land for apple trees by back-furrowing, planting the trees on the ridges. One such orchard, seven years planted, was leveled in the spring of 1876, and in so doing, many roots were broken by the plow. The injury was not severe enough to show itself much during the summer, yet a large number of these trees were injured by the sudden November freeze following, while others in the same orchard not so treated, escaped. Pruning tops or roots may be useful, and advantageous, but we shall be much better cultivators when we learn to practice it just as medicine should be taken—for a well-considered purpose and under competent direction.

II. A very little protection, as by sticks, cornstalks, or even dry weeds, keeps off rabbits as do grease or blood, but these favor rather than otherwise the attacks of rats and mice. The best protection in the orchard is tarred building paper, and this may be useful in other ways. Hundreds of trees, three to four inches in diameter, were killed in Illinois last winter by rats, which were very numerous in the fields. In the nursery, shoot, trap, or feed these animals. If well-killed off, and the stragglers fed with corn when the snow covers the ground, trees may be saved.

III. Shoot the sapsucker without mercy, but be sure you know the bird. Two other woodpeckers winter over with us and much resemble the enemy here spoken of, but these are friends, picking insects from crevices and cocoons with wondrous instinct. All these birds have a red-crested head and a black-and-white speckled body above, but the harmless ones are white beneath, the other yellowish. It, too, eats insects, but the orchardist will not profit by sparing it.

IV. We pass here the whole subject of insect depredations because they have been so often written up and for want of space, merely stating our conviction that orchardists should be thorough practical entomologists at least so far as their special insect friends and foes are concerned.

V. Here we have to acknowledge the opposite of the remark in the previous paragraph. No one has ever given us anything like a complete history of the fungus parasites affecting apples, neither do cultivators appreciate the real and often serious consequences of their injuries. Fungi are looked upon as the productions of peculiar states of the atmosphere; conditions of growth of the plant etc., while to the botanist a "mildew" is as much a distinct and specific plant as the apple-tree itself. Each is the product of a germ, each is subject to certain conditions and laws of growth, each lives, secures food in its own way, develops and dies. Among animals some crop the herbage and are content; but others, usually minute creatures, lice, intestinal worms etc., only exist by parasitism. So with plants, some use as food inorganic substances, while others are wholly dependent upon the living or dead bodies of other plants and animals. The whole class of fungi (mushrooms, toadstools, molds, mildews, smuts, etc.) belong to the latter category and some of them exist only upon living subjects. Some of these last can be as successfully sown and propagated artificially as wheat or corn, notably, for example, the mold (Oidium) upon growing peaches.

It is true, many of them become seriously destructive only under certain condition of the host or of the weather etc., but this argues nothing against the active cause of the resulting disease being the fungus parasites. But, however specific the action of these agents, we know little of specific remedies. The best of all preventatives are wise cultivation and management so as to secure vigorous growth and well-matured wood. Wheat rust — a fungus — is mainly avoided by early seeding; so seedling apple-trees may escape mildew if great care is taken to get them early and vigorously started. Besides this, plant in open, sunshiny ground, not as has been advised in half shady positions. No application of chemicals has yet been found practically useful. The disease here called Leaf Scab is not very common, I believe, on cultivated trees, but frequently occurs on the wild crab-apple. An orchard of several varieties was seriously injured by it in August 1877 in Southern Illinois. No remedy known.

Various forms of black molds or mildews prey upon apple trees and one, at least, affects the fruit, forming dark, cloudy patches upon the skin, which it does not penetrate. This upon the fruit does not appear injurious except in spoiling the appearance of the apples. Sometimes it shows itself in minute black spots clustered together, especially conspicuous on yellow surfaces. The same fungus spreads over the twigs and leaves, though not so often noticed in these situations. In all cases the cloudy patches are formed of closely-jointed, irregular, black threads variously woven together. It has been known under the name of Spilocæa pomi Fr., but doubtless is a form of some other species having more definite fruit. It is quite probable that strong solutions of potash would remove it, could these be applied to the growing apples. Smoke, especially of tobacco, is another probable antidote and by the use of some kind of a hood for the tree might become a practical remedy.

Twig Blight of the apple is almost certainly the same as "Fire Blight" of the pear and both of fungus origin. In both the blackening of the bark is preceded by myriads of moving corpuscles in the cambium resembling the products of Fungi and Lichens, known to botanists as spermatia, which have recently been proved to be germinating bodies. After the death of the twig similar germs are found in conceptacles like little pimples raising and finally rupturing the epidermis. Other much larger spores in similar conceptacles are also found a few days after the twig dies if the weather is damp. These have long since been classed in the genus Dipledia, but whether or not they have anything to do with the disease is still unknown. It is more probable that the black sooty mold which appears to survive the winter on the twigs and is known as an Antennaria is the destructive agent, under, in summer time, another guise. The life history of these molds is exceedingly intricate, but we may hope before long to fathom their mysteries and find remedies for them.

The scab on apples is certainly the work of a fungus, but it is fairly probable that its first introduction is due to the puncture of an insect. It may be that Aphididæ or lice do more damage in this way than in any other. At all events the scab when it first appears is a mere point which afterward enlarges from this point as a center. The threads of the fungus, quite dark in color, burrow under the healthy epidermis and soon give rise to a crop of once-divided spores, closely seated on the vegetating threads. As the parasite advances it dies behind, so that the surface of the flesh of the apple, devoid of its epidermis, is left exposed, the fungus existing in a ring which constantly increases in size. The exposed tissues afterward forms a thin corky coating which in some cases becomes much like an epidermis again. If this happens early enough in the season the part generally outgrows the remainder of the fruit and forms an obtuse hump or elevation having a somewhat different texture from the rest. If the corky covering is not sufficient, as is always the case when the fungus continues its growth until the fruit is gathered, common molds (Penicillium, Aspergillus and Mucor) gain an entrance and cause premature decay of the fruit. This is by no means the least of the injuries of the "scab." It is probable that this mischievous parasite lives in some form upon the tree, twigs or leaves.

The unbroken epidermis of the apple is an excellent safeguard against decay, being all but impervious to water and germs of fungi, without which germs rot, as we know it, would probably never occur. For this purpose it is sometimes wise to select such varieties, Ben Davis for example, as have a thick compact skin, however much this may be thought a fault for eating.

In some localities trees of all ages die and upon examining the roots, they are found covered with a papery, or even leathery, felted, fungus production often capable of being peeled off in flakes or sheets. This is the mycelium of a fungus which in this situation bears no fruit or spores, but which is quite certainly some kind of Polyporus so common upon decaying wood and forming hard, shell, or hoof-like excrescences on the surface while the active vegetating threads (mycelium) are busy in the work of destruction inside. It is probable that this spreads from decaying wood to the living roots and if so the remedy is plain. Apparently good results have followed digging a large hole when preparing for transplanting and making a fire in the hole before setting the tree, taking care not to fill in chips etc. Chip-dirt used as mulch may have bad effects.

The word "blight" is used for many diseases of plants, though the diseases themselves are

very distinct. Sometimes in midsummer, even while the tree is loaded with fruit, the leaves drop, leaving the branches almost naked. The pear is more subject to this malady than the apple, but the latter occasionally suffers severely. The cause cannot be definitely stated, but the spots on the leaves with the black papillæ therein, show the presence of minute fungi which may be responsible for it. I am not aware that the matter has been thoroughly investigated.

Bitter Rot is probably, but not positively, due to some similar parasite. Here again nothing has been proved. That certain varieties are more susceptible to it than others tells us nothing as to its cause in these.

The rest of the diseases and injuries named in the table must be dismissed with a word. The tarred paper heretofore recommended as protection to the trunks, is also useful in preventing "sun-scald." Mulching with straw etc. to retain frost in the ground, does not materially delay the swelling of the buds in spring, but trees on a northern slope are later than upon a southern one. Trees on relatively high ground often escape spring frosts which destroy the blossoms on lower lands. Mulching or frequent surface cultivation aids the tree to withstand drought or heat. Wind-breaks of quick growing trees, at least in prairie countries, are valuable upon the south and west sides of an orchard but not on the north. Sometimes evergreens distributed among the trees do good service. Select, if possible, land naturally very deeply drained, remembering that standing water will kill the tree, or so weaken its vitality as to render it a prey to the depredators indicated above. Proceed with caution in the selection of varieties, always preferring those that have been proved in the locality to any others, no matter what the agents say of their value elsewhere. Correct over-bearing by hand-picking soon after the fruit is set. Better one good, fair fruit than half-a-dozen half-developed ones. Thinning over-laden trees also gives them a chance to bear the following year.

SLITTING THE BARK OF HIDE-BOUND TREES.

T. T. LYON.

Nature has assuredly provided all needful means for the expansion of the outer covering of plants, as well as of animals. In the case of what are known as hide-bound trees, my inference, (or theory, if it is preferred to so designate it,) is that the difficulty is to be sought, not in the refractory character of the outer covering of the trunk, but rather in *demoralization* at the root—possibly in some disease, or parasitical robbing of those essential organs of nutrition; or, quite as likely, in some deficiency or incompatibility of the soil—it may be excess, or possibly even lack of moisture, or the presence of some unfriendly constituent.

In the absence of any clearly indicated cause for such disease, if disease it should be called, my first search would be at the root, for indications of disease there; and next, I would resort to the culture and amelioration of the soil, and the free use of suitable manures, if thought desirable, feeling assured that while "slitting" can by no means induce growth, in the absence of nutriment, the wonderful digestive apparatus with which every plant is provided will, beyond doubt, greedily assimilate all the food supplied by the root—providing its own means of "slitting the bark" whenever and wherever space may prove too narrow for its accommodation.

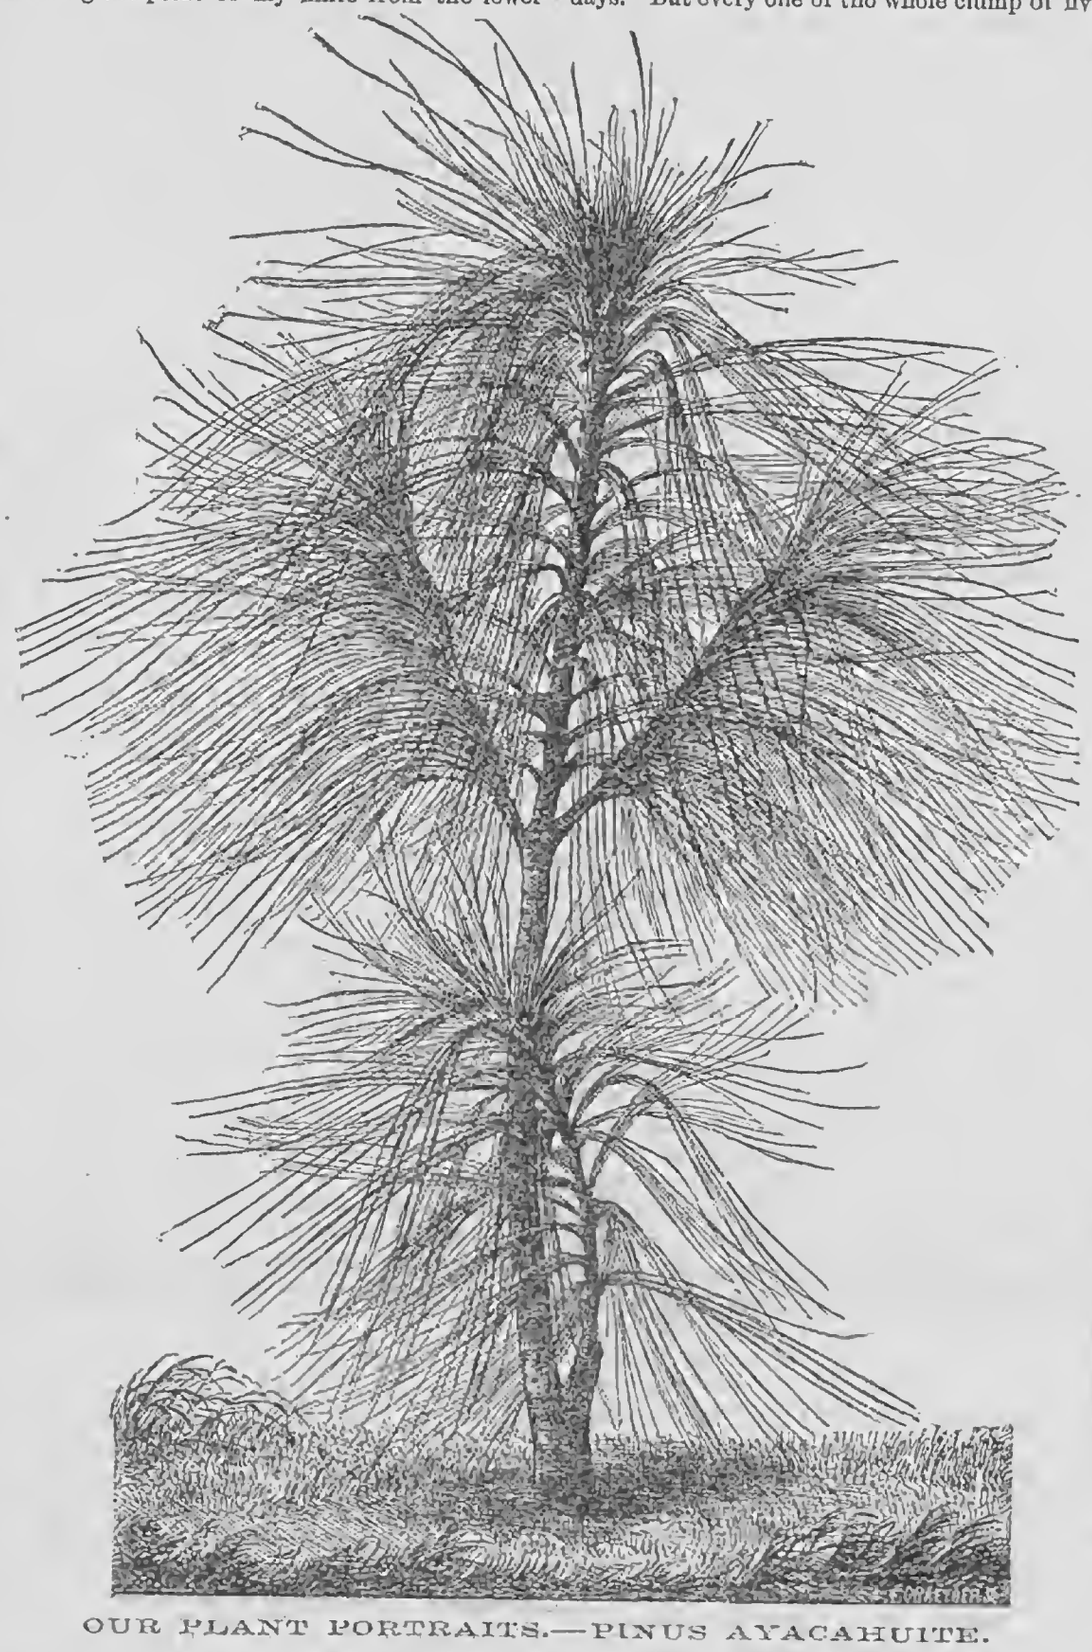
That this "slitting" process may and does result in the more rapid enlargement of the portion of the tree so operated upon, we are by no means disposed to question. But what is gained? The trunk will, if left to itself, appropriate its proper share of the nutriment supplied; while we gain nothing, but rather lose, by increasing its size at the expense of the other members. Slitting the bark is, with more propriety, resorted to, in the case of crooked growths, where a slit or two upon the inner curve will, by increased enlargement at such point, hasten nature's effort to supply the defect. The process should, however, be always employed with care and discretion. Especially is this the case with the stone fruits, such as Cherries, Plums, and Peaches; for the reason that, if the knife should run too deep, or be employed for this purpose at an improper stage of growth, there is danger of the exudation of gum from the wound, which, under the trying climates, and with the rich soils of the West, is very likely to result in the annual enlargement of the wound, and the premature death of the tree.

It is believed that one of the most fruitful causes of this condition of trees will be found in the wrenching or swaying of their trunks by the force of the wind, and the consequent breaking loose of the fibrous roots from the soil; thus cutting off the chief sources of nutrition, and leaving the plant in a semi-starved condition—a condition likely to be continued indefinitely on account of the liability to an occasional recurrence of the cause, operating to prevent the renewal of the connection. We hardly need say that the remedy for this difficulty should be sought in the careful staking of the trees; or, still better—may be prevented by branching very low—at or near the ground.

South Haven, Mich., Jan. 17, 1877.

ABOUT SLITTING "HIDE-BOUND" TREES.

It is more than thirty years since I tried slitting the bark of plum and cherry trees that were said to be "hide-bound." This was done by drawing the point of my knife from the lower



OUR PLANT PORTRAITS.—PINUS AYACAHUITE.

branches along the trunks down to the ground, cutting through the tough, stringy, outer bark a sixteenth of an inch deep, perhaps. As I cut, the bark opened and spread an eigth of an inch wide, and the opening followed my knife as though the bark had been too tight. Then I certainly thought I had done a good thing. My mother set me at the job and showed me how to do it. Afterwards, at her suggestion, I took interest enough in the trees to put some fine scrapings from the barn-yard around them, on a circle of five or six feet, and spaded it in. The trees grew for a few years but are dead and gone long since. Whether mother really thought at the time that the slitting was necessary for the trees or that it was something that a green boy with a jack-knife would probably like to do, is more than I can tell. About that time we were engrafting a good many seedling horse-plums about the house with larger sorts and the cions were very apt to out-grow the stocks, making the need of slitting more apparent. With such a boy and such a lot of trees on hand one might work them off together in that way. It couldn't do much hurt and it might be a good beginning for the boy in lack of more exact science. The children must be started in business if parents and teachers don't know so much. I remember the slits made ugly scars on the trees, that showed plainly enough in the bark when they were cut for firewood. Afterwards mother and I both gave up the practice—being led thereto, probably, by something we learned of the nature of tree growth in the rather meagre agricultural prints of the time. Now-a-days, I would no sooner cut the bark of a tree to let it grow than I would cut the skin of a "hide-bound" calf to let it grow. Vegetable assimilation and the economy of animal life will elaborate materials to swell and enlarge the bark or skin as fast as new layers of fat or sap-wood need more room. I have been tempted since then to slit the backs of Misses' waists that were pinched too tight, as such artificial integuments are not so likely to grow with the form. The white birch, we know, is always "hide-bound," as the thriftiest plums and cherry-trees are. There was a bunch of stunted birches near our garden at the time we began to grow market fruit. When horses or oxen were waiting for any cause they were hitched by the birch, so its roots often got a little manure. Directly it began growing, till now, after five years, it has become a very showy tree indeed, and gives a welcome shade on hot days. But every one of the whole clump of five birches is as "hide-bound" as it can be. This you may prove for yourself by sliting the bark of any birch ever so little after it has commenced growing in spring. J. B. Olcott.

My experience has been considerable in slitting the bark of hide-bound trees. I have never known it to do harm. With regard to young trees that have been neglected, or grown in poor soil, before cultivating and manuring them, I think slitting is a benefit. The back of such trees seems indurated, offering an obstruction to the free flow of sap. This constriction is relieved by slitting the bark on the trunk and larger branches. F. H. Hoskins.

Arboricultural.

PINUS AYACAHUITE.

The life-like engraving of this Pine, which we here present to the reader, is sketched from a specimen scarcely two feet in hight. We had supposed, before soliciting the experience of several of our best-informed writers upon such topics, that it would prove quite hardy, even north of New York. As will be seen, there is some conflict of opinion upon this point.

Mr. Josiah Hoopes writes us as follows:—"It is a Mexican species, attaining the hight of about 100 feet, and found on the mountains at an elevation of from 7,000 to 8,500 feet. In general appearance it resembles the P. excelsa, although, wherever it has been tested in this country, there has been no evidence of the disastrous blight that has destroyed the Bhotan Pine. It is closely related to our northern White Pine (P. strobus), but with longer, drooping leaves, and much larger cones and seeds. After several years' experience, I have no hesitancy in pronouncing it quite hardy in the Middle States."

Ellwanger & Barry say:—"Some twenty or more years ago, when we were collecting conifers from all quarters, we got from Europe the Pinus Ayacahuite, which is a Mexican Pine, something like our White Pine, but it was not hardy, and, with a host of others not suited to our climate, was abandoned."

Mr. J. R. Trumpy of the Kissena Nurseries, Flushing, N. Y., says:—"I have known this Pine for twenty-five years; it is very hardy here, although a Mexican species. It belongs to the Strobus section, or five-leaved Pines. Sometimes, however, you will find six leaves or more near and around the terminal buds. It may be propagated from seed, or by grafting on P. strobus or any other of the five-leaved Pines."

THE OSAGE ORANGE TREE.

This tree recently referred to in the Gardeners' Chronicle as being difficult to get a stock of in England, is among the cheapest articles in some of our nurseries. In Western nurseries it is grown for sale in immense quantities, as it also is by other Eastern nurserymen. The price varies according to the quantity and quality bought, from two to five dollars per thousand plants. It is our best hedge plant for the Western States, where it grows readily and rapidly, is particular neither as to soil nor situation, bears pruning with impunity, and makes a most unassailable fence.

I know nothing about its hardiness in England, but I should consider that it won't be more particular in Europe than it is in America. I lately saw a couple of big trees of it in the gardens of General H. W. Sargent, Fishkill Landing, N. Y. They were growing luxuriantly right up alongside of some Hickories, where anything else would starve. The ground around them was thickly strewn with their fallen fruits. These trees almost annually suffer a zero frost.

Sir Joseph Hooker, while on his recent visit to our country, was particularly interested in these Osage Oranges in Gen. Sargent's garden; and, if I remember rightly, remarked that they were the first fruits of the kind he had seen maturing in the open air. The General tells me Sir Joseph recounted to him the occasion of the Osage Orange tree having ripened fruit in one of the glass-houses at Kew, and a basketful of the oranges were sent to Queen Victoria. By mistake they were served as dessert on the royal table! A not very complimentary appreciation accompanied the acknowledgement of their receipt. W. F.

Pomological.

SOME NEW HARDY APPLES.

DR. T. H. HOSKINS.

In my article upon "Iron-Clad Apples," I spoke of a number of new and mostly unpropagated varieties recently discovered through the exertions of the Montreal Horticultural Society, to which my attention was drawn during my attendance at their exhibition last fall.

These varieties I speak of as new, and they are so in the sense of being new to pomologists. But many of them have been long known among the French population of Canada, and grafts of most of them have been more or less distributed up and down the lower St. Lawrence Valley. There is a great fondness for good fruit, and not a little appreciation of choice kinds among these French peasantry; but they are very clannish, and indisposed to communicate the good things they possess to their English-speaking and Protestant fellow-countrymen. Those who have many trees of these choice varieties, absolutely refuse to allow cions to be taken from them. I have been endeavoring for months, with the aid of leading members of the Montreal Horticultural Society, to obtain trees or cions, but with almost no success at all. I can procure specimens of the fruit, for these are offered for sale in the markets, but that is all. I mention this fact, not only as curiously illustrating a trait of character in a large class of people, but also that my readers may be spared the trouble of sending in vain for cions. If a way should be opened for procuring them, I will make it known hereafter.

The first varieties I shall mention seem to be of the Fameuse type, and give the idea at once of being seedlings from that variety. They are all of medium size or under, strongly colored, with the color penetrating the flesh, sometimes to a very remarkable degree.

Fameuse Sucre.—This is an inviting, blackish-red little dessert apple. It is of the same size as Fameuse, but much darker in color than the reddest of that very variable variety in respect of color; form roundish, or slightly ob-

late; flesh white, deeply stained with red; very crisp, yet tender, at once mildly sub-acid and sugary, with an aroma of a most peculiar, penetrating and enduring quality, more like that of some spicy foreign grape than of an apple. I am bold to say that no known apple equals Fameuse Sucre in delicacy and piquancy of taste. It is a true revelation, in apples, of a capacity for flavor, which we might look for in some rare tropical fruit, rather than in an apple from the extreme north. It is not a *sweet* apple; it is a deliciously *sugared* apple, as its name indicates, with a distinct aromatic acidity beneath the saccharine, like, yet unlike, the highest-flavored strawberry. The season of Fameuse Sucre is from the middle of September until the last of October, or later. The tree seems as hardy as Fameuse; it is upright in growth, it spreads but gradually, its branches bear the bright gloss of health. Like Fameuse, it bears light and heavy crops alternately. Those who have it, say it equals Fameuse in yield.

ROSEAN.—This is not the Rosean of any of the books. The fruit is of oven, medium size, oblate, basin wrinkled; color, a very dark red; flesh white stained with red, crisp, juicy, subacid, high flavored. Season, September. Tree, hardy and long-lived, a moderate grower, with an upright close head; an early, yearly, moderate bearer.

MOUNTAIN BEET.—This is, in some respects, the most singular apple I ever saw. It is of medium size, roundish-conical, very dark-red, almost black, yet with the clear red shining through. But the curious thing about it is its flesh, as deeply red to the core as a blood-beet, with a red juice, staining the fingers like that of a strawberry. The fruit has the aroma, but not the sugared quality of the Fameuse Sucre—a sort of "country cousin" of that variety. This tree is in the hands of at least one nurseryman, is regarded as productive and hardy, and is being set for profit in the well-known fruit growing town of Abbotsford, P. Q. It is the only variety in this list of which I have yet been able to procure cions. Season of fruit, October and November.

CANADA BALDWIN.—Fruit, size of Fameuse; roundish-oblate, overspread with streaks and splashes of dark over light-red, with many distinct gray specks. Flesh white, often much stained with red, tender, crisp, juicy, mildly subacid. Keeps till May or June. The tree is a vigorous grower, with a somewhat upright, though gradually spreading head. It has fruit-spurs distributed evenly along its branches, and bears as young as the Fameuse, in alternately heavy and light crops. This variety has got out of the hands of the French, and is propagated and planted to some extent at Abbotsford. It has the fault, on light soils, of sun-scalding upon the bark, but is otherwise hardy. Would probably do well top-grafted.

POMME DE FER.—This is the late keeper of the Province of Quebec. There is a tradition that it was brought from Philadelphia over a hundred years ago by the Seigneur of Chambly; but this is improbable, as it is not recognized as much resembling any American apple, while its seedling, the Canada Baldwin described above, is of the distinct Canadian type. Tree, fairly hardy, a moderate bearer. Fruit, above medium, roundish to roundish-oblong, dull-red, with many very distinct gray dots, somewhat like the Flushing Spitzenberg. Flesh yellow, very firm, moderately juicy, mildly sub-acid, somewhat aromatic. This apple keeps till June or July, but is not highly recommended by the Montreal Society.

STRAWBERRY OF MONTREAL.—This is none of the "Strawberry" apples of the books. The tree is extra hardy, and its stout and vigorous growth and clean, glossy bark, show it to be especially adapted to the cold north. It is erect in growth, without having a dense head. Fruit above medium in size, sometimes large, roundish-conic, yellowish, mostly splashed with red. Flesh yellowish, tender, moderately juicy, mildly sub-acid. It ripens with the Duchess of Oldenburgh, but is a better dessert apple. Placed by many growers among the best five for profit. It has been propagated to some extent by the Messrs. LACOMBE, BIGARREAU and DESMARCHAIS, Cote des Neiges, P. Q., and I recommend it to the attention of your readers in the cold Northwest.

DECARIE.—Regarding this apple, I make the following extract from the invaluable report of the Fruit Committee of the Montreal Horticultural Society for 1876:—"What, if a seedling, was the 'original' tree, producing this noble apple, stood in JEREMIE DECARIE'S orchard in Coteau St. Pierre, east of the Cote St. Luke road, which orchard is now owned by his grandson of the same name. It was cut down a few years ago. It was then about a hundred years old, had a butt as large as a flour-barrel, and was of a hight so remarkable as to be compared to an elm. The tree is a vigorous grower, and forms an erect head, which spreads but very gradually, so that though it attains great size, yet it may be planted fairly close. We have seen eighty, if not one hundred of these trees, planted fifteen years ago on the Coteau, and growing in sandy loam, and from these we judge the tree to be hardy and healthy. It bears light and heavy crops alternately. We once saw seven barrels under one tree which had been fifteen years planted. Mr. LORTIE, after marketing them for many years, says they are very profitable. Fruit, on trees grown in grass, even when they have suffered from want of drainage, large; but when the soil was cultivated, very large, and commanding marked attention. Form, roundish-conic to oblong-conic, often deeply ribbed, with a deep, narrow, russety cavity, and a basin which, though medium in depth, is wrinkled and obscurely ribbed. Color, light or dark-red, sometimes very dark all over, and covered with a beautiful bluish-white bloom, with many medium-sized gray dots. Flesh whitish, rather firm, juicy, with, says DOWNING, a slight and peculiar quince-like flavor. Season, September 15 to October 1."

Thus I have redeemed my promise with regard to these Canadian apples which magnetized my attention and excited my unbounded admiration when seen and tasted for the first time last fall. Though living within 100 miles of the localities where they grow, they were entirely unknown to me, who am an orchardist and tree grower. I feel sure they will be equally new to most of your readers. I shall keep track of them, and hope soon to rescue myself and others from the present Tantalus-like condition of wanting without being able to obtain them.

Newport, Vt., Jan. 16, 1878.

ABOUT THE PEACH.

PROF. A. W. MANGUM.

A BOOK entitled "The Natural History of North Carolina," was published in Dublin in the year 1737. The author was JOHN BRICKELL, M. D. He does not restrict his account to Natural History, but adds a sketch of the trade, manners, and customs of the inhabitants, both Indian and Christian. Some of his statements are interesting to the reader of to-day. His article on the Peach suggests a comparison of that delicious fruit in that day, with the product of the orchards of the present. He names the following varieties: Queen's, Nutmeg, Newington, Grand Carnation, Black, White, Roman, and Indian Peach; and states there were many other kinds. He says: "These fruits thrive to admiration, coming to perfection without any pains or trouble—a peach stone being planted or dropped on the ground, will grow and bring forth a peach tree that will bear in three years or sooner." The young trees sprang up so thickly as to form a perfect wilderness of trees; and the farmers pulled them up like weeds. The weight of the fruit often broke large limbs. The dried fruit was considered a tonic, and "grateful to the stomach." The people made "a liquor of them which is very cooling and good in fevers." The flowers were used as an aperient, anthelmintic, and to "open obstructions."

The Indian Peach was "common amongst the Indians," claimed as their own, and as being in America before the Europeans came. The tree grew as large as any apple tree, the fruit not generally larger than the common yellow peach, and more downy. It was "an extraordinary good fruit; very soft and full of juice;" would freely part from the stone, which was larger than in the yellow kinds. The Indians that were remote from the whites had no other variety. It was less subject to injury by the northeast winds. Vinegar was made from it, and it was sometimes called the vinegar peach. The author does not give full credence to the theory that it was a native of America, because he could not learn that it was ever discovered growing wild.

Several thoughts are suggested by this peculiar description. Is it not a faint intimation, through an unsuspected medium, of the ancient "Home-laud" of our aborigines? Is not Western Asia the only land to which the Peach is indigenous? May not some of the first wanderers have brought, by accident or design, the seed of the Persian fruit, and dropped it in the soil that proved so well adapted to its growth?

It is worthy of note that we still have what is known as the Indian Peach. It was always remarkable for its size. It is distinguished by its downy surface, its abundant juice, its blood-red color under the skin, and its marble-like texture when divided with a sharp knife. Those that I have seen, at least most of them, are what are commonly called "cling" instead of "free" or "clean-stoned." They appear to thrive longer under neglect than other species. I noticed this in a declining orchard that I visited during the past season. One of this description is called here, the Georgia Peach.

Even in those old times, the peach tree would break with its burden. Did it never occur to you that such a peculiarity indicates the natural demand for pruning? Is it not a process of natural self-help? I am quite sure that the peach tree needs more trimming than it gets. During the great fruit season of the last year, the trees were seriously injured by the loss of large limbs. Some fine trees looked as if they had been crushed by a tremendous sleet. If the limbs had been shortened so as to throw more of the weight on the trunk, the damage would not have been done. Under the advice of an experienced nurseryman, I have sometimes shortened the limbs of the trees in February, or a short time before the bloom opens. His theory was that it delayed the blooming and thereby gave a better chance to escape the frosts. I think it is desirable to shorten them at any time, with a view to the strength and symmetry of the tree.

An old nurseryman in this State, some years ago, finding that the trees of a Peach orchard were failing—they being rather old—fell to work with his saw and cut off all or nearly all the limbs, to so short a measure that all his neighbors thought he had completely ruined every tree. On the contrary, the orchard renewed its growth and yielded abundantly. From observation I am inclined to the opinion that the *better* varieties of the Peach tree are commonly more brittle than others. Has this any connection with their holding their good qualities, or even improving?

Farm Topics.

ADULTERATION AND TESTING OF SEEDS.

PROF. W. J. BEAL.

WITHIN a few years, various European countries have begun to make quite a stir on this important subject. The more the subject is investigated the worse it appears, and the more extensive does the practice appear of selling worthless seeds. Old seeds or those killed by boiling or baking are mixed with good seeds. Some seeds are dyed. Quartz ground and colored, is used to adulterate seeds of clover and other plants. Some old seeds are dressed in oil or smoked with sulphur to improve their appearance. There are many experts in the business of doctoring seeds. In all old countries seeds are liable to be adulterated with seeds of vile weeds. Seeds can be tested by placing them between layers of moist flannel or thick woolen paper and keeping them in the proper temperature.

EXPERIMENTAL STATIONS.

These are becoming quite numerous and very popular in England, France and Germany although it is only about twenty-five years since the first one was started. For testing seeds the oldest station is not yet ten years old. In this country we learn that something has been done the past season, at the experimental station in Connecticut. Last spring at Michigan Agricultural College the writer began some experiments in testing seeds. We know that the rascals do no not all live in Europe. Who can beat our corrupt rings and the extravagance of our insurance companies. We have our basswood hams and wooden nutmegs, our adulterated teas, spices, coffee, candy. We might extend the list indefintely, showing that almost everything we eat, wear, or use is often counterfeited in some way or other. Under this state of things, shall we expect that all the seeds which are sold in this country are genuine? Are the seedsmen alone, above all men honest and beyond reproach?

The past summer, during the month of June, I purchased seeds at different stores in Adrian and in Lansing. These were sold in small packages. I counted the seeds myself and planted them as well as I knew how in nice soil which was very slightly screened from the sun. In nearly all cases, I planted fifty seeds of each variety. In case of beets I planted fifty fruits, each one of which contained from one to three or four seeds.

Look at the above figures. They are worth thinking about.

Of the seeds sown from Detroit Seed Company about 37 per cent came up.

Chicago Seed Company	about 47 "	"
D. M. Ferry & Co.	" 49 "	"
Briggs & Brothers	" 23 "	"

Weak seeds produce weak plants. The vigor of the plants in the above trials was not taken into account. It would have added force to the above tests, if I had sown at the same time, the same quantity of seeds which I knew to be good, or those which we had grown and collected. To a limited extent, I have done this.

On May 20th, I sowed in small boxes in a cold frame two lots of forty seeds each of onion seeds of the following companies.

	Came up

Seed Grown at this College	34
" "	39

In the last experiments with the onions, the College seeds produced plants, which, at the age of three weeks, were fully twice as large as those from the papers bought of the groceries. The plants were not allowed to mature. Something of the fairness of the first experiments may be seen by comparing the results of the onion seeds with those of the last experiments. The seeds of each firm, in each case, were from the same lot.

At two or three different times, last spring, packages of seeds of carrots and parsnips were sent for trial. They had been prepared in some way and had been rolled in a light colored powder. It was claimed that the seeds thus prepared would come up in a few days, and that the gardener would thereby gain a good deal in his fight with the weeds. I am sorry I have lost the name of the person who sent the seeds, but perhaps it makes no difference.

PREPARED SEEDS.

July 13 I planted 20 seeds, in 13 days 2 were up.
" 18 " 50 " 12 " 11 " "
" 25 " 30 " 6 " 26 " "
35 " 10 more were up.

SEEDS OF J. R. ROOT.

July 13 I planted 20 seeds, in 13 days 17 were up.
" 18 " 50 " 12 " 28 "
" 25 " 30 " 6 " 30 "

Comment is unnecessary, you see the inferiority of the prepared seeds in every case tried.

It is impossible for me to learn how much was paid for garden seeds such as are put up in small papers and sold at the groceries. The trade is quite large, however. In Lansing, Michigan, a town of about 9,000 people, one grocery sold last year of these papers to the amount of eighty-two dollars; another a little over one hundred and four dollars. We all know groceries are very numerous in every town. Testing seeds as to their adulteration and germinating powers is a subject which will receive further attention the present year.

WESTERN FARM TOPICS.

PROF. E. M. SHELDON.

WHEAT GROWING.

BRIGHT sunny days, and sharp frosty nights—the frost culminating a week ago, when for two nights in succession, the mercury dropped to within three degrees of zero—have characterized the weather of the two weeks last past. Within this time corn picking has been pushed with an energy that even the holidays have scarcely interrupted. The more closely the corn crop of 1877 is examined, the plainer it becomes that the quality is greatly inferior to that of 1876. The cob is large and the grain chaffy and loosely set. From almost every quarter of the State, the cry comes that the quality of the present crop is fully ten per cent. below that of the year previous.

IMPROVING WHEAT LANDS.

In almost every rotation wheat is the objective point; the culmination of the course of cropping. It is, moreover, of all crops in general cultivation, the safest one by which to judge of the effects of a given system upon the soil. If the yield of wheat is increased or even maintained from year to year, it is safe to conclude that our system of farming is, at least, doing no injury to the soil. Wheat is a plant of Epicurean tastes, a delicate and fastidious feeder. It riots, indeed, in the new soils of all countries; and because they contain in abundance, those subtle combinations of organized and mineral matters in which it delights, it laughs in full harvests at the slovenly cultivation it so often receives. But when from any reason the soil becomes lacking in the elements of fertility, the wheat crop is the first to hang out the white flag. The

wheat plant well repays generous cultivation, but a good soil enables it to endure without complaint, much neglect of this kind.

In reply to Mr. MASON'S inquiry, in the RURAL of Dec. 22, I would say in the first place, that the soil he describes—the bottoms "a medium, heavy, slightly sandy loam, three to four feet deep, resting on a sandy, porous subsoil," the uplands, "of the same general character but with a greater proportion of sand"—comes very far short of being typical wheat land. Such soil as this, will require careful handling; it will become easily "run down," and when once down, it will need skill and patience to bring it into condition again.

The best way to grow wheat, is not to grow it—if I may be pardoned the Hibernianism—upon land such as that described above. Wheat ought not to grow on such land oftener than once in four years, and during the intervening three years, it ought to grow one hoed crop, which should have been heavily manured and thoroughly tilled. The two remaining crops, whether of forage or grain, should be wholly consumed upon the farm. If clover or the tame grasses are safe crops, the farmers of Dodge Co., have a remedy within easy reach. If this land can be laid down to clover or some one of the tame grasses, and pastured for two years, a long stride will have been taken in the direction of its regeneration. As to the possibility of employing commercial fertilizers in the growing of wheat, I question much if anywhere west of the great lakes they can be profitably employed for this purpose. These are very simple directions, and they have a strong flavor of old fogyism, it may seem; nevertheless, there is no "hocus pocus" in the business of farming; there is no such a thing as satisfying the wants of a hungry field with the contents of one's vest pocket; no possibility of making condition powders, pills and drugs satisfy a soil exhausted by a long round of dissipation. What such a soil needs is plant-food, like in character to that which it has so freely yielded the thriftless husbandman, and this will be best obtained by the farmers of the whole country, by growing largely of forage plants, grains and grasses, for consumption upon the farm.

Mr. MASON and his neighbors will do well to beware of the error so often made by improvers, in supposing that a greater variety and a better arrangement of crops, are alone sufficient to increase the fertility of the soil. A farm may be utterly ruined while tilled to the letter of the most approved rotation. The whole secret lies in returning to the soil what has been taken from it in crops sold from the farm; and whether this is done by feeding stock upon the farm, by green manuring, by summer fallowing, or by the use of commercial fertilizers, must be determined by the surroundings of the farmer.

ABOUT WHEAT GROWING IN GENERAL.

In the letter referred to above, the writer, after stating that wheat is the staple crop for export in his State, goes on to say: "the result is, the whole country is under mortgage for borrowed cash, store, machine and other debts and taxes." So far as I have observed, mortgaged farms are the necessary concomitants of every distinctively wheat growing country. The reason of this is not far to seek. While wheat brings a large and quick return in cash, per acre, it requires a large outlay, *in cash*, to produce it. In the first place, the considerable wheat grower must own a drill (cash or note at 12 per cent.,) then he must procure a harvester, (cash or note as before,) and hire harvest hands, paying the highest wages (cash); then comes threshing (cash,) with the summer's waste that always attends this operation. Compare the growing of wheat with that of corn. The growing of the latter crop entails upon the farmer not a single expensive operation. The entire labor of the corn field, from turning the first furrow to cribbing the corn, may be performed by the farmer unaided, and when the crop is harvested it may be turned to half a dozen uses from which wheat is debarred by its very nature.

To grow wheat in a new country is generally a necessity to the pioneer, and often it is a profitable crop, but if after this time, wheat growing is allowed to attain to anything like a specialty, it is pretty certain to bring upon the farmer a long train of evils, among which are "mortgages," which will only be "lifted," when he adopts a course of mixed husbandry,

Manhattan, Kas.

Industrial Societies.

FRUIT GROWERS IN COUNCIL.

Discoveries and Suggestions of 1877.

THE twenty-third annual meeting of the Western N. Y. Hort. Society held in Rochester Jan. 23–25th was altogether one of the most interesting and profitable in its long and successful experience. A great mass of facts elicited from discussions, and in the papers and addresses, and some of these are of great importance.

In calling the meeting to order, President Barry congratulated the Society on the progress made during the past year. Small fruits have been unusually abundant and low priced. The partial failure of the apple and pear crops has alone prevented a more serious depression in prices. But the American market is extending; Western New York is near the sea-board cities, and of winter fruit it is now generally conceded that Western New York apples will keep better than those of other localities. Hence we are reasonably sure of a good market for all the *good* fruit which can be grown. He would advise the planting of apple orchards under proper conditions and in suitable localities, as confidently now as at any time during the last twenty-five years. Work in fruit-growing is sure to be well paid, provided always the work is well done.

The election of officers and appointment of committees were the first business, and resulted in the choice of the following officers for 1878.

President—P. Barry.

Vice President—J. S. Woodward, H. E. Hooker, A. C. Younglove.

Secretary and Treasurer—P. C. Reynolds, Rochester.

Executive Committee—James Vick, Rochester; I. H. Babcock, Lockport; H. H. Farley, Union Springs; E. A. Powell, Syracuse; D. H. Henry, Geneva.

STANDING COMMITTEES.

On Native Fruits—J. J. Thomas, Chas. Downing, Wm. C. Barry, E. Moody, G. Zimmerman.

On Foreign Fruits—W. R. Lazenby, George Ellwanger, T. C. Maxwell, H. N. Langworthy, C. A. Green.

On Nomenclature—Chas. Downing, P. Barry, J. J. Thomas, D. W. Beadle, George G. Atwood.

Entomology—J. H. Comstock, C. D. Zimmerman, E. W. Sylvester, H. T. Brooks, Wm. Saunders.

Ornamental Trees and Plants—George Ellmanger, C. M. Hooker, T. C. Maxwell, George Moody.

Garden Vegetables—E. S. Hayward, John Craine, C. H. Crosman, J. W. Gray, T. W. Lay.

Ornithology—H. T. Jones, Henry Harrison, E W. Chapin.

Botany—W. C. Barry, Geo. T. Fish, W. H. Coleman.

Chemistry—Prof. G. C. Caldwell, C. H. Mann, Joseph Harris.

Flowers and Bedding Plants—James Vick, F. B. Lewis, Henry B. Ellwanger, E. Bronson.

There have been about 150 members the past year, including the leading fruit growers and horticulturists of the State. The Society has issued a report of its proceedings and papers, and the treasurer's report shows a balance of $28.35 on hand.

There were some notable articles on exhibition—specimens of dried fruit preserved by the Reynold's Evaporator and exhibited by E. J Potter of Medina, attracted much attention. There is an evident profit in this process whenever the fruit-market is glutted. The evaporated fruit is white and preserves the natural taste of the green fruit. Hence it brings a higher price than fruit dried by the usual process. Mr. E. Ruhleman of Lockport exhibited a coil of tin two inches wide which he uses as a collar around celery plants to keep their leaves from spreading apart. It makes the cultivation of celery a very easy process. Messrs. Ellwanger & Barry exhibited seventeen varieties of winter pears, and ten varieties of apples. Mr. Heath of Genessee, Co., also exhibited specimens of winter apples of fine quality.

Probably the most practically useful article on exhibition, and one which attracted much attention was a box containing about 150 specimens of insects injurious to farmers and fruit growers, and also the parasites which prey upon the same and are thus the fruit grower's friends. The insects are finely mounted and some of the specimens are very rare. This box was prepared by Charles D. Zimmerman of Buffalo, and presented to the society. Mr. Z. promises a similar collection next winter, an excellent example for young men.

The apple crop in Western New York in 1871 was not a large one, and a peculiarity of its growth is that the largest crops have been in localities which have not heretofore produced largely. Chautauqua county sells this year fully 200,000 bbls. of apples, at an average price of $1.50 to $1.75 per barrel, a loss of at least two hundred thousand dollars from lack of information as to the value of fruit. Surely, here is a waste which would pay for a good many agricultural and horticultural journals.

Mr. Julius A. Kuck, of Kucksville, Orleans County, has an old orchard of 149 trees, set sixty years ago, which has for many years been cultivated and heavily manured without cropping. The plowing is always done in May—and the soil is left loose through the season. In the last seven years this old orchard has produced apples which have sold for $7,871.25, or something more than $1,100 per year. The manure made on the farm is mostly applied to this orchard.

The discussions chiefly ranged around the subjects prepared by the Business Committee.

Quinces.—Considerable time was devoted to this fruit, justly considered the most profitable for the localities where it succeeds. It is not entirely hardy, especially in the roots. Hence, it needs deep planting, and is better kept in grass if the grass is shaven and left as a mulch, and the soil highly manured. No fruit will bear higher manuring. Salt is excellent, and should be applied in the spring at the rate of a quart per tree, spread under the branches as far, or a little farther than they extend. The quince should not be cultivated, as its roots are tender and easily injured. A heavy cool soil, and if moist none the worse, is best for the quince. The borer is less troublesome on heavy soils. In sand or gravel, quince trees are usually failures. The Orange quince, and Rea's Mammoth were the two varieties most highly recommended. Quinces bring from $4 to $8 per barrel in the New York market. Dr. Sylvester sent them in bushel crates, and got $3 per crate for them.

Peach Tree Worm.—This is a new enemy which eats the heart from the terminal shoots of peach trees. It is most destructive in nurseries. Prof. J. H. Comstock, of Cornell University, described this enemy. The only known remedy is to cut off the twigs which appear injured and burn them. This should be done in June or July, before the worm escapes.

The Peach Tree Borer.—Placing leached ashes around the base of trees was recommended as a means of preventing the beetle which lays the eggs from depositing them. The ashes were first applied as a manure, and this effect was accidentally discovered.

Peach Yellows—It was seriously questioned whether this disease had appeared in Western N. Y., unless in a few trees procured from New Jersey. Good culture with manure, careful watch for the borers and destruction of all found will keep Western New York peach orchards in thrifty condition. Some peach trees suffered severely from the intense cold of the winter of 1874. Such trees are popularly supposed to have the yellows; but if examined it will be found that their roots are injured by the cold.

A worse difficulty in growing peaches, is from cold in winter and frosts in spring. In level localities a sheltered spot should be selected. In hilly regions elevated sites are preferable. Timber screens are beneficial on the east and west, and sometimes on the north. With a little care in selecting good localities peaches, may be profitably grown all through Western New York.

The Canker-Worm.—This pest of the apple tree may be headed off by winding strips of paper around the trees and coating them heavily with coal tar and lard, the latter to keep the tar from hardening. If some falls on the bark of the tree it scales off and does no injury. Another remedy suggested, is to have troughs around the base of the tree filled with crude petroleum, which will prevent the ascent of the female moth. This remedy is liable to the objection that the petroleum if spilled may injure the tree.

Fertilizers for Fruit Trees—There is nothing better than stable manure, but not enough can be had. Muck is good if we get the right kind, fibrous and not too much decomposed. It may be profitably composted with stable manure, six or seven loads to one of the latter, with ashes and with salt. The coarse grass which grows on muck swamps, if piled up with it, helps decomposition, Salt was recommended as a good fertilizer for all kinds of fruit trees. It helps to decompose plant food. Ashes are good, and leached ashes, 300 bushels per acre, are excellent on sandy soils, helping mechanical texture, and furnishing needed manurial elements.

Utilizing Surplus Fruits.—The only new answer to this consisted in the new processes for preserving them, either by drying or in cold ice-houses. It pays to send only the very best fruit to market. In that way the use of fruit is encouraged and its market extended.

Frauds!—A good deal of a scare was raised by a report of a legal decision that seedsmen and nurserymen are liable for damages when plants untrue to name are sent out. It proves, however, that the decision applies only where there was fraudulent representation of the facts. Nurserymen are not liable for the results of their many mistakes and may go to bed without fear of awakening as bankrupts. The Society adjourned Friday noon after the customary votes of thanks to officers and others. It will meet in Rochester again next year, that being the most convenient place for delegates from all parts of Western New York to assemble.

RURALIST.

NEW FRUITS OF 1877.

IN the discussion by the W. N. Y. Hort. Society on new varieties of fruits, the old new varieties of Peaches, Early Beatrice, Rivers' and Early Louise were commended by Mr. MOODY. President BARRY said that Briggs' Red May, a California peach, was at the present the earliest variety known. Dr. SYLVESTER spoke highly of his seedling, the Richmond, which proves on testing all the good qualities originally claimed for it. It is hardy and productive, a little later than Early Crawford, and of higher quality.

In grapes there was a large number of new and promising varieties named. Messrs. HOAG & CLARK of Lockport have a white seedling produced by inbreeding Concord and Martha. It has all the hardiness and vigor of the Concord, excels it in productiveness and is far superior to the Martha or any similar white grape. "As good as the Rebecca, and as vigorous and productive as Concord," is praise which gives assurance that a white grape "for the million" has been secured.

The Lady was considerably discussed. Its quality is superior to that of the Martha, and it has the advantage of being the earliest grape, with the possible exception of the Champion. This for a white grape is a novelty, and will give the lady a permanent value without regard to its quality.

MESSRS. GREEN of Clifton, Monroe, and HANDY of Orleans County, described new seedlings in bearing, which promised to be valuable. Not much is known of them, and they require further testing.

Pres. BARRY spoke of Moore's Early, a Massachusetts variety, as of the highest promise. He also described a seedling which he had been testing several years—one of two selected from several hundred, all the others being thrown aside as of no value. The one most promising is a Cross of Diana on Delaware. It is thrifty, productive, and of the highest quality. The delay in sending it out, is only because it has the fault of dropping its berries; but it very rarely does this, and never until dead ripe, and it is unexceptionable in every other respect.

The Brighton Grape was very highly spoken of. It is succeeding in a variety of situations and in quality ranks as "best." It is hardly a new variety.

The difference between Worden and Concord is very slight; but the Worden is a few days earlier, and of a little better quality. Its skin is thinner than Concord's, and it cracks, unfitting it for shipping long distances.

In new Raspberies, Mr. HANDY of Orleans Co., described a new red Raspberry, of Black-cap habit which promised to be valuable. Its fruit is firm and a very good quality. Its color is a dark red, and appears to be a hybrid between the Red and Black-caps; but differs from the Ganargua.

Mr. ODELL, of Monroe, described some wild, red Rasperries which grew on the plains at the West after being burned over. It seemed to him to be worthy of cultivation. The local name is Salmon berries. There is another kind of Raspberries called Sallal berries which grow on these Western plains. They grow in clusters, three to five in a bunch, and are as large as cherries. The flavor is excellent, sweet, and somewhat peculiar. Undoubtedly something will come from these Western varieties.

President BARRY warmly commended the new Strawberry named Sharpless, which is now being disseminated. The Great American, and Parmlee's Crescent Seedling were inquired about, but none of the members had fruited them.

W. J. F.

Industrial Implements.

A NEW BUTTER-WORKER.

A NEW butter-working machine has been recently put before the agricultural public, that combines some novel features that we think are good. The implement is a circular revolving table, placed on a stand of the necessary hight, which is turned by a crank fitting into cogs that encircle the outside of the table. Attached to the crank is a grooved "worker" of a peculiar shape, and not to be intelligently described without the aid of the pictorial art. The axle of one end of the "worker" is fitted into a pin that projects up through the middle of the circular table, so that in operation the worker covers a section of the table extending from its center to the circumference. The butter is emptied on to the table, and as soon as the machine revolves, the peculiar shape of the "worker" coming in contact with the concave and sloping bottom of the table, gives a gentle downward direct stroke, *pressing* in its action. The expressed milk runs away to the center of the table where it escapes through an opening prepared for it. The worker more closely resembles hand treatment than any machine we have yet seen. It comes to pieces easily and may be cleaned with the least trouble.

There can be no reason why butter should not be improved when worked in this machine. The grain is not injured. HENDERSON & Co., Philadelphia, Pa., own the patent and make the machines.

JONES, FAULKNER & Co. of Utica, N. Y., have purchased the patents of the late WM. RALPH and are now the sole manufacturers of the Oneida Cheese Vat. This Vat has long been favorably known to our readers as one of the best for single dairies and small factories.

Domestic Economy.

CONDUCTED BY EMILY MAPLE

SIFTINGS FROM THE KITCHEN FIRE.

ANNIE L. JACK.

"THE cows keep up their milk well," said WILLIE, as with an air of pride he brought in and strained the evening's supply. "And the butter is of a good color too," said one of the "girls," while WILLIE added, "Oh yes, that is because we feed them *corn-straw*." It is a good thing to teach little boys to milk, and our lad of ten can attend to two cows as well as a man, and understands the duty of rinsing the pans, straining carefully and putting into the milk-room without troubling his sisters if they are otherwise engaged. This article of milk I think is not sufficiently appreciated by farmers, and I often wonder to see so many half-grown boys and girls fond of their cup of tea, and owning to a disregard for milk from having too much of it, as the Scotch would say, "Among their hands." Milk is the type of all food, and one pint from a good cow contains two drachms of mineral salts, six drachms of sugar, half an ounce of butter, six drachms of cheese (caseine), and nearly fourteen ounces of water. It is the only article on which adult, as well as infant life can be supported exclusively, unaided by any other aliment. For a delicate stomach it is also easy of digestion either hot or cold, boiled milk requiring two, and raw milk two and a quarter hours for that purpose. As a supper for growing boys and girls, nothing is better than good, wholesome bread scalded, but not boiled, in plenty of sweet milk. While in daily use but few people stop to think in how many ways this wonderful fluid is used and if it were valued, and always upon the table as a beverage or in some pleasant form of food, we should see far more rosy cheeks and bright eyes among our pallid young people. A very nutritious and easily prepared dish for lunch or tea is as follows:

Milk Toast

Toast stale bread quickly and a delicate brown; take off the crust, and dip each slice, while hot, into boiling water; salt slightly and lay in a covered dish. Boil some new milk in a saucepan, adding a little salt and a tablespoonful of sweet cream; pour over the toast and cover closely. It will be ready to serve by the time you are all seated and ready to pass the first plate.

DOMESTIC RECIPES.

To Dye Scarlet

One and one-half ounce of muriate of tin; one ounce of cochineal; one ounce of cream-of-tartar. To one pound of cloth or yarn allow three gallons of water; when blood-warm, add one ounce of cream-of-tartar; increase the heat a little and add one teaspoonful of the pulverized cochineal and three-fourths of an ounce of muriate of tin; wet the goods in warm water; put into the dye and boil one hour, turning often; take out and rinse in cold water; then add the remaining cochineal and tin liquid to three gallons of warm water; put in the goods and proceed as before. This recipe for scarlet is the best I have ever known. It does not fade or turn dark when washed with soap.

Fruit Cake

One and one-half pint of milk; one cup of cream; two cups of sugar; one-half cup of butter; one-half pint of molasses; one and one-half cup of hop yeast; add flour to make a thick batter and let rise all night. In the morning add one cup of butter; six cups of sugar; five eggs; one tablespoonful of soda; one-half cup of wine; seven pounds of raisins; spice to taste; stir to a thick batter; put into tins and let rise again; bake as you would bread.

Sponge or Jelly Cake.

Two eggs; one cup of sugar; five tablespoonfuls of water; one and one-half cup of flour; one and one-half teaspoonful of baking powder. For jelly cake, bake in layers.

Mrs. MAPLE: Those who use the pen so much can have little idea how hard it is for one who handles the broom, mop and dish-cloth continually to take pen and ink and write her thoughts upon paper. How I wish that it might come to pass that farmers' wives could use their hands less and their brains more! All that I know is to work hard from morning until night with scarce time to read a newspaper, while those who have time for mental improvement seem to care nothing for it MRS. D. W. JOHNSON.
Gowanda, N. Y.

To Prevent Pie-Crust Becoming Soaked

Having myself received much information from the "Domestic Economy" department, I should like to tell my RURAL sisters of an excellent way to prevent pie-crust from becoming soaked or "soggy," which is as follows:—Rub over the under crust well with the beaten white of an egg, before filling the pie. Should the upper crust be brushed with the egg, it will do no harm. If pie-crust is mixed with good, sweet cream, and prepared as above, I can see no reason why it is not perfectly healthy.
Linn Co., Mo. MRS. F. M. BEERS.

Pound Cake.

Eight eggs beaten separately; not quite one pound of butter; one pound of powdered sugar; not quite one pound of prepared flour, or flour with two heaping teaspoonfuls of baking powder. Beat the yelks, sugar and butter together, then add the beaten whites and flour by degrees, alternating until both are stirred in; flavor with lemon.

Chocolate Cake.

Two cups of sugar; one cup of butter; four eggs; one cup of milk; scant three cups of flour; two heaping teaspoonfuls of baking powder; bake in layers. For the chocolate mixture: Grate one cake of sweet chocolate; beat the whites of two eggs to a stiff froth and add a cup of powdered sugar. MRS. ISAAC CARMAN.
Hempstead, L. I.

Veal Cake.

Cut slices of cold roast veal and boiled ham, very thin—there should be as many again slices of veal as of ham; cut three or four hard-boiled eggs into slices; chop a few sprigs of parsley fine; butter a mold, and put in alternate layers of veal, ham, eggs and parsley—seasoning each layer with pepper and salt; fill up with good stock, and bake in a brisk oven about one-half hour; when cold, turn out and garnish with parsley. This is nice for tea.

Curry of Cold Meat.

Cut thin slices of cold roast beef into rather small pieces; slice thinly, and fry an onion in about two tablespoonsfuls of butter until nicely browned; then pour in as much good broth as required for the gravy; add a little salt and a tablespoonful of curry powder; let boil up and add the beef; stir constantly for ten minutes; make a border or wall of boiled rice around a dish and pour the meat and gravy in the center.

To Curry Eggs.

Wash and slice thinly an onion; fry to a nice brown in two tablespoonfuls of butter; add a tablespoonful of curry powder: one pint of good broth, and a little salt; let cook until the onions are tender; thicken one-fourth pint of cream with a little corn-starch, and stir into the other ingredients; let simmer a few minutes; then add twelve hard-boiled eggs cut into halves; warm through and arrange the eggs upon a platter with the gravy poured over them.

Simple Peach Pudding.

Split open milk crackers and butter slightly; put a layer of crackers upon the bottom of a pudding-dish; then a layer of *hot*, stewed peaches with plenty of juice, and sweetened to taste; thus alternate the layers, leaving a layer of fruit for the last; make a meringue, flavor with lemon and spread over the top of the pudding; let brown in the oven for a moment. To be eaten when cold. E. M.

Everywhere.

RURAL SPECIAL REPORTS.

NEOSHO VALLEY, Kan., Jan. 9.

WHILE reading the RURAL, I find a good many pieces from different parts of the country, but it is not often that I see anything from Kansas, and thinking the readers would like to see notes from this section of the country as well as I do from other sections, I send you a note or so.

I live about seventy miles south of Topeka, eight miles from Burlington, the country seat of Coffee County, which is on the line of the Missouri, Kansas and Texas Rail Road, and is the terminus of a rail road that is being built from Kansas City, Missouri, and is to be completed by March 1st. It is just what Neosho Valley has been in need of for a long time—a direct outlet to the East for its products. The crops were very good the past season. Oats extra good. Corn is worth 20c.; oats, 16c.; wheat, 80c.@$1.00; pork, $3.25 per 100 pounds; hay, $2.50 per ton. Stock raising is the principal occupation of the farmers in this section. It is well watered by creeks, and there is excellent range for thousands of head of cattle and sheep. Coal underlies nearly the whole county.

E. C. F.

CORTLAND, N. Y., Jan. 15.

SNOWING and growing colder again. We have had good sleighing for the past week. The second annual show of the Cortland County Poultry Association opened here to-day. We have a fine exhibition, the largest that has ever been held in this section, over 400 coops are in—and it promises to be a financial success. In the show, Asiatics take the lead with a large exhibit of Games and Bantams. All the prominent varieties are to be seen with some exhibits of very fine birds. Plymouth Rocks, which seem to be the coming fowl in this region, are largely represented. A fifty pound pair of Geese attract a great deal of notice as does also the fine exhibit of fancy pigeons made by Messrs. WHITE and the Sanlsbury Co. The Association is in a prosperous condition. Poultry is quite an item in the products of this county; one of our large raisers shipped over twenty tons to market this last season. K.

EL DORADO, Cal., Jan. 7.

WE have had the coldest weather ever known in this section, for the last ten days—frost every night, and on several nights ice formed on water, over half an inch thick. In many places water pipes were burst open from the effects of the frost. To-day it looks like rain. It is predicted by an old Mexican that we are going to have a flood that will destroy all the grain in low sections, while on high places and the foot-hills we shall turn out the best harvest ever known. Apples are decaying badly. Fruit trees are being set out. Sowing and plowing are in rapid progress.

WATERTOWN, N. Y., Jan. 14.

WE had some cold weather and snow the early part of the month, but it has moderated again—and this is our fourth day of rain; mud is shutting off all communication with the country. Farmers cannot get their produce to market, and hauling logs is out of question. This is the most remarkable winter we have ever had in this region. W.

LITTLE FALLS, Jan. 21.

WEATHER here warm and pleasant. Snow nearly all gone from fields and it looks more like first part of April weather than January. There has been scarcely any sleighing here during the winter, which is most remarkable as the snow generally falls early and deep:

X. A. W.

GENEVA, N. Y., Jan. 21.

WE have had a very open winter. Thermometer to-day, at noon, stands at fifty degrees. There is a larger acreage of winter wheat here than usual: it looks well, the Hessian fly having done but little damage in this section. Nursery stock is in good condition. W. L. C.

Miscellaneous.

HOW SHALL WE EXPERIMENT?

WE have been favored with MSS of portions of the report of CHAS. W. GARFIELD, the accomplished Secretary of the State Pomological Society, Grand Rapids, Michigan, to be issued next month, and from it we are glad to make the following interesting extracts:

Our people want facts that are the result of careful observation and experiment. These they can take hold of and incorporate into their own methods. One may, however, start out with an honest intention of conducting a careful experiment, and after following it for a time, the final result seems so evident that the temptation to "run across lots," thus gaining time, is too strong, and a portion of unexplored territory remains behind. The great majority of "I believes" among farmers and fruit-growers are made up of just such experiments and nearly the whole of them are entirely worthless, because of the lack of the connecting links of careful observation that were lost by "running across lots" or in other words jumping at conclusions.

It is the fact that there are experiments without end—as seen from the records of agricultural papers—and so little real progress as the result of them all, that gives emphasis to our leading interrogation. The fact is that the larger portion of these so-called experiments are worth nothing—worse than this, their value is a minus quantity because they are calculated to mislead. They are nearly all of very short duration, and they are thrown upon the public to be swallowed by open mouths—yes, so very wide open that the eyes are shut against the theory that dangles to each one and that goes down too.

Glancing over the papers that have come to my table the past week, I find three remedies for pear blight, the result of careful experiment. For each is claimed originality, perfectly satisfactory results, and each is recommended to pear culturists everywhere as a discovery long sought and finally found. Two of these startling disclosures are made after one year's trial, the other has had double that time to prove its worth. All of them to my certain knowledge, have been in print before and were lost sight of because valueless. Other experiments of a similar character have been the use of nut lime to drive away the codling-moth, burning coal tar to drive away the curculio, and sprinkling salt on the garden to destroy the cut-worm.

So much for the literature of experiments. Let me say further, that I scarcely go anywhere but that I find men are experimenting, in their way, and are constantly arriving at valuable results, that guide them in their practice. This is their own statement of the case. These results are generally sources of continual error, and act as a snare rather than an assistance in the operations of the farm and garden. The worst of it is that they have obtained such a firm hold upon the people, that there is no possibility of loosening it. Advancement is thus checked, and production decreased rather than augmented.

The removal of prejudice is one of the happy results of thorough and well-directed experiment. The power of facts is supreme. The believer in the transformation of wheat to chess may doubt your reasoning, when you tell him the impossibility of it in nature's economy; but when he brings you a sample of this chess and you show him, after carefully washing the root, the original chess kernel from which it sprang, he will not doubt his own vision.

Experiment, well directed, helps people to understand the necessity of going to the bottom of processes and methods before too general an application. Surface indications are soon seen to be very untrustworthy, and it is found to be more satisfactory to know a little, and *know it*, than to believe a great deal, with only a shadow for a foundation. Satisfactory experiment requires

ABSOLUTE SIMPLICITY IN METHODS,

for two prominent reasons:

1st. Any complication is liable to divert observation from the real work, and the result will be a warped judgment and worthless decision. For instance, if one is pruning a tree, at different seasons, to observe the relative rapidity with which the wounds heal, he must not, at the same time, be pruning that tree with the idea of producing wood on one part and fruit on the other. Nor should he try the effect of thinning the fruit on that tree, with the expectation of watching the result and getting at some principle. All this complicates the first experiment so much as to render the decision at the end of it questionable.

2d. There is danger, in trying to establish too many facts at once, that we shall get hopelessly lost in a labyrinth of testimony, and give the theory up in disgust. In experimenting, one may be skillful in watching a simple process for a negative or positive result; but when he so places his experiment as to be perturbed to a considerable extent, he may be far from sufficient to get at a correct judgment.

Again: Proof positive upon never so small a point is worth a good deal, as a stepping-stone to other judgments of more sweeping application; hence there is great value in absolute certainty of little decisions, the result of experiment in reaching out after facts of greater import.

WHAT IS NEW?

To be a successful experimenter, one needs to have some knowledge of what has been accomplished in the department he takes up for investigation, since the history of any branch of agriculture or horticulture will show that a great many things have been tested over and over again by persons ignorant of each other's work. Glancing over agricultural papers, in one there is a "new method of cultivating wheat" that attracts the attention. It may be new to the author, but to the world it is old as the Christian era, for VIRGIL describes the same process in detail. A scientific man who can lay claim to a large amount of general information, is giving in one of our papers "A new theory of tillage," and still, after a careful perusal, one who has a good library of agricultural works from JETHRO TULL down to WARING, can open to places, here and there, where he will find, not only this same theory carefully given, but great quantities of facts upon which the hypothetical method rests.

In learning what has been done, we fit ourselves for better work; for we can profit by the mistakes of those who have entered the field in advance of us. Several men moving across a marsh at intervals, will not be liable to all sink in the same hole. Those coming later will avoid the place where their predecessors sank through. So in experimentation; accurate knowledge of former experiments may save us a great deal of time and expense, and may aid us to strike more quickly at decided results.

The fear that the requirements are such as to forbid ordinary persons from experimentation, need not deter any one from work of this character. Many simple, yet important experiments can be performed by any one in connection with the work of the farm and orchard; while the more elaborate ones must be undertaken by those who are drilled for it, and who have the ability, time, and money to expend.

The knowledge we desire to obtain is both scientific and practical, and one sort should not be sought to the exclusion of the other. We want to know the truth first of all, and in all our in-

vestigation, it is of the highest importance that we eliminate every possible source of error from our methods. A fact in science must be a fact, not a supposition or a guess; and after we have established it, our next desire is to find its practical bearings on the work we have in hand, out of which we gain a livelihood.

Then, in answer to the interrogation of where we should look for new questions to solve, or old ones that are not yet settled, I will say that in the production of new varieties of flowers and plants for the green-house and border; new and hardy improved vegetables for the garden; new and hardy fruits for the orchard; new and better adapted grains for the fields, there is an opportunity of originating things that are really new to the whole world. And when it comes to the adaptation of methods of culture and kinds of fertilizers especially suited to these new things, we may be working upon an old principle, but our detail of facts will be new.

Probably the richest field for discovery in horticulture to-day is in the production of new varieties adapted to special systems of culture, or to peculiarities of climate and situation that in themselves are unchangeable.

REQUISITES IN EXPERIMENTING.

As to just the method to pursue in carrying on these experiments, I can condense in a few sentences my own convictions.

1st. There must be a basis of knowledge from which to work; that is, one must know something of what has been done—and how to go to work upon the case in hand; he must understand how to so simplify his work that the results shall not be rendered nugatory by complications.

2nd. There must be a distinct purpose in view. I do not mean by this a point to prove, for this in itself would so warp the experiment as to render its results worthless. He who closes an experiment by the comment on the results, that he knew it would come out so, was not fit to perform the experiment at all. By a definite purpose I mean that one should have a clear notion of what he is at work upon, so as not to be led off from careful observation in the direction of his experiment.

3d. An experiment needs to be performed with great care. It must not be put off or shoved aside for anything else when it demands attention. If it is worth attempting, it is worth all the care necessary to make it perfectly satisfactory.

4th. In performing an experiment there should be absolute honesty. The moment we doubt the veracity of one who experiments, we lose confidence in any result he may give us. It will not do to think a certain result is seen—one *must know* it. There is nothing that is to be done in this world that requires a greater degree of veracity and honesty than this matter of experiments; and when one prominent experimenter fails in this regard, we are apt to distrust others even more than when a minister falls from the path of rectitude.

5th. Experiments should be performed with liberality. I refer now more particularly to horticultural experiments. They should be the property of all who will be benefited by them. The time, money, and thought put into them should be donated freely for the good of the world.

Entomological.

EXTERMINATING THE CABBAGE BUTTERFLY.

B. PICKMAN MANN.

THE winter months afford the best opportunity for the extermination or at least the very great lessening of the numbers of the Cabbage-Butterflies (Pieris rapæ.) This butterfly is probably very well known in a general way to all the persons in the Northern United States, who have had occasion to work in gardens where cabbages are grown or who are at all observant of the insects that fly about our fields and roadways. It is of a white color, with a black dash at the tip of the fore-wings and a black spot on the front edge of the hind-wings above, and with two black spots on the underside of the fore-wings. Besides these spots, the male has *one* in the middle of the fore-wings above, and the female has *two*. The spring butterflies are much whiter than those produced later in the season and sometimes lack some of the black spots; occasionally bright yellow males are found and almost never yellow females. The full spread of the wings is about five centimetres. With a very little care there will be no danger of mistaking the common yellow clover-butterfly (Colias Philodice) for this.

The caterpillars are pale-green, finely dotted with black, with a yellowish stripe lengthwise along the back, and with a yellow stripe, formed of small, yellow spots, along each side. When fully grown, they are two and a half or three centimetres long. They may be found from April to October, of all ages, feeding on the leaves of cabbage, mignonette, stock, nasturtium and other members of the mustard family. They are supposed to have four or five generations in a year, the last generation passing the winter in the condition of chrysalids. At this stage of their lives they are exposed to view or can be discovered with ease, and it is at this time they can be destroyed with the least expenditure of work.

It is the habit of the caterpillar, when its time has come, to leave the cabbage-heads and seek a convenient place for the formation of its chrysalis. For this purpose it crawls into the corner formed under the copings of fences or under the projecting edges of clapboards, or hides under stones or boards or in a crevice in a fence or wall. Here it spins a loose mass of silk in which it entangles its hindmost feet. Holding the body horizontal it then spins a thread of many strands, which forms a loop inclosing the body and attached by both ends to the board above. The shedding of the caterpillar skin soon follows, and the chrysalis appears.

The chrysalids are about two centimetres long, sharp-pointed at the head and tapering at the opposite end, with a sharp ridge on the back of the fore-part of the body and a saddle-shaped hollow just behind this ridge. They are light-brown in color. As will be seen by what I have said above, the pupas are not inclosed in any cocoon or concealed in any way. It is true they may be formed within a pile of boards or in some similar place where they are difficult of access, but the presence of such resting-places and the absence of others will be a sufficient indication to the intelligent gardener of the searches he will need to make.

The destruction of the pupas by fire or crushing is simple enough, but now comes a further consideration, showing that practical entomology fails to be practical if it is divorced from the more technically scientific entomology. A large proportion of the pupas are attacked by a minute parasite (Pteromalus puparum,) which is four-winged, of a golden or coppery red color with a green head, and is three millimetres long with a wing-stretch of four or five millimetres. Fifty or more of those parasites find food and shelter within one pupa of the butterfly. In destroying the infested pupa, therefore, a great number of the best friends of the gardener are also destroyed. It is difficult to separate the infested from the uninfested pupas; at any rate it's not worth while to attempt to do so. A device may be adopted which I recommended to the Brazilian government in 1871, when employed by them to devise measures for the protection of coffee-trees from destructive insects. This is, to place the gathered chrysalids in a wire cage, out of doors, so that when the parasites hatch, they may escape freely, but when the uninfested butterflies hatch they may not be able to escape. For this purpose, any box, however rude, covered on one or more otherwise open sides with a wire netting of centimetre meshes, will answer. As the chrysalids put into this box would necessarily lie one upon another in an unnatural manner, they should not be allowed to get wet by rain or snow, so as to be in danger of molding or rotting; they should be placed under cover and not more than two or three layers deep. At the same time they should not be exposed to artificial warmth, for not only might such warmth be injurious to the parasites, but it would be very likely to hasten their development, and bring them to maturity while there was no proper opportunity for them to deposit their eggs.

Entomologist, Cambridge, Mass.

Dairy Husbandry.

AS TO THE SKIMMER.

J. M. PETERS.

I HAVE never known a man to meet with much success in his efforts to discourage another from carrying on a business which he found profitable, and so long as a dairyman finds, or thinks he finds, profit in making butter and cheese from the same milk, it will undoubtedly be a difficult task to completely stop the manufacture of skimmed cheese. It is possible, however, that the greatest profit is not to be realized from skimmed milk by manufacturing it into cheese, and if this fact can be demonstrated, the most ardent advocate of skimmed cheese would, I presume, be willing to give up its manufacture.

Prof. ARNOLD, in an address before the dairymen of St. Lawrence Co., the other day, introduced the subject of skimming and his recently patented improvement in the manufacture of butter and cheese from the same milk, by stating how much substance was thrown to the hogs and "wasted" when butter alone was made from milk, and went on to explain how this "waste" might be saved and the profits of dairymen greatly increased by the proper manufacture of two products. But he failed to produce any showing of the difference between "wasting" skimmed milk on hogs, and making it into cheese for the "home trade." St. Lawrence Co., dairymen have during past years, strenuously opposed the use of the skimmer in cheese factories, and the manufacture of cheese from skimmed milk. As compared with other sections of the State where different notions have prevailed, their profits have been large, and they are now uniformly thrifty, with a world-wide reputation for the excellence of their cheese. These are facts. During the past season a very few cheese-makers in that county practiced skimming, and as the make of skimmed cheese in the whole State was smaller than heretofore, it realized a little better prices and made fair returns to the makers, if they do not count the loss of reputation worth anything. I find, however, by conversation with the intelligent dairymen of that county that those who have made butter and have fed their skimmed milk to the hogs, have made more profit than those who have made two direct products out of their milk. Had I not been hurried, it would have been possible to make an exact showing of results to substantiate this statement which, I respectfully suggest to Prof. ARNOLD, is opposed to his idea that milk fed to hogs is wasted. Equally good results have been realized also from feeding to calves, and so long as the meat supply of the country is so scant, and its cost to the consumer so high as at present, these must be the most profitable uses to which skimmed milk can be put.

The manufacture of skimmed cheese is the curse of American dairying, and if the makers in figuring the profits they have realized from its production, will offset the account with the losses they have sustained through a diminished home consumption and the injury to their reputation in every foreign market where a skimmed cheese has been sold, they will find the balance to "profit and loss" very much increased and transferred to the other side of the account. And even if there be an increased temporary profit, it does not require much reasoning or foresight to see the position into which competition will ultimately drive our dairy interests, if a constant effort is not made to maintain the highest possible standard for our products.

The Horseman.

TANDEM DRIVING, &c.

GEO. W. GARDNER.

IN England this manner of driving, with one horse harnessed before the other instead of, team-fashion, side by side, is confined to sporting men and gay young gentlemen, more of it being seen in Oxford than in any other city in England. There the collegians who are, many of them, sons of the nobles, being restricted to short leaves of absence, and wishing to have a frolic, generally travel around Oxford in this fashion with fast horses to be clear of the proctors and spies, and so go quickly many miles and have time for their fun.

I have seen them 20 miles out of Oxford, though seldom so far; and two racing thoroughbreds will run over the country in this style at a flying pace. The accomplishment of driving so as to go at the rate of 20 miles per hour safely, is soon learned, and it is wonderful to see them turn a corner at such a rate that one would think they must inevitably tip over. In fact, after taking wine freely at their rendezvous, they will often drive recklessly and carelessly and go over at nearly every turn, but according to the general rule in such instances, Bacchus must have shades employed to care for his devotees, as it is seldom any of these wild young fellows is seriously hurt.

In Canada East, especially all around Quebec, there are no horses to be seen side by side on the farm—going to market or elsewhere it is one horse with a light vehicle, or two, one before the other. So rarely is a pair of horses seen side by side that when the writer's son drove into Quebec, the people in the villages on the way, would come outside of their houses to look at them. There would often be 20 to 30 tandem teams going to a wedding and nothing thought of it. At funerals also they are common especially during sleighing time, for the roads are then covered with snow for six or seven months to a great depth, and are safely firm and hard only for a certain width, so that a couple of teams with the horses in each side by side could not pass when they meet without sinking in. Use is second nature: everybody, boys and women too, can take the reins and drive along with all confidence.

French Canadians are the lightest hearted race in the world and, although they can do nothing on their farms for months together on account of the snow, I have heard them, night after night, driving home from their parties, balls, &c., singing so happily and also so musically, often accompanied by instruments, that it made me believe these Canadians are decidedly the most contented and cheerful people to be met with. The way to become a good driver of a team, tandem fashion, is, first of all to sit behind some horses which have long been accustomed to run in this way, and any one can soon understand all about handling the horses and driving either from practice or from lessons given by a professor. Any one having leisure and means might take a trip to Quebec, and by hiring a team from a livery stable, he would be completely at home in driving in a week, and in two or three weeks would be as good a "whip" as one of 20 years standing. This, of course, is meant to apply to anyone who has been a horseman in other respects before.

Now, about four-in-hand: the driving of four horses that have been used to be driven so, is very easy, and is also very safe for there is no danger of their turning short, or coming back, as one horse is a check on the other. There are thousands of four- and six-horse teams in Pennsylvania and Maryland and my eldest son, when only 16 years old, has driven five and six into and through Baltimore many times. Throughout the whole of a very large district in those two States four and six horse or mule teams are used, the teamsters sitting on the near hind horse, and having merely a single rein running to the near side leader. These common farm teams are only mentioned to show how easy it is to break horses to go steadily and safely, for these have no check on them but the single rein.

A gentleman by practicing can readily "get his hand in" so as to drive four at any pace he chooses up to full speed. When I was a very little boy there was a Captain PINFIELD who, living on an estate near Newport-Pagnel in Buckinghamshire, used to amuse himself by driving four-in-hand along the turnpike road leading from there to Northampton. He had three of the best trained four four-in-hand teams in England or, I should say as good as any, for at that time there were horses much better fitted than our present animals for traveling long distances and hard riding. Captain PINFIELD would overdrive and get a team rather shaky and then he would let them do light work on his farm till they became clear and all the puffs had disappeared. There were coaches at that time in all directions and the Captain would run his four-in-hand team round a coach, time after time, as it was going along at its usual pace of about ten miles an hour. This was the same neighborhood where a gentleman named Osbaldiston who kept a pack of fox hounds rode 200 miles on horse-back in ten hours. This was done around a race-course by changing horses every four miles, about 15 horses having been used, one of which was ridden as many as seven or eight times.

The Herdsman.

EDWARD FOWLER'S SALE OF CHANNEL ISLAND CATTLE.

A REMARKABLE sale of Channel Island cattle took place at Harkness' Bazar, in Philadelphia, on the 10th of January. EDWARD FOWLER, an old importer, and one of the largest buyers of Jersey cattle for the English market, brought over eleven Jersey cows and heifers, two Jersey bulls, and six Guernsey cows and heifers, and these were sold at auction, realizing the sum total of $7,685, or an average of $384.25 for the nineteen animals. One fine Jersey heifer, fully equal to the average, died on the passage. One had brought a bull calf, which was sold separate from the dam, for $95, but is included with her in the above total and average. The Jersey females alone averaged $436 36. The two bulls sold for $500 and $200, respectively, and the Guernseys averaged $364 16.

Bids were made in a reckless sort of way. Two or three times a bidder raised upon his own bid, but was honorably protected by the auctioneer. A heifer, to all appearance barren, sold for $375. An old cow, over ten years old, but a really excellent one, sold for $340. The heifer which had calved showed a fine bag and teats and, though offered without her calf, brought $560—more than several equally good or better animals, which were near calving, brought; and yet, the chances were even that these would produce heifer calves.

The buyers were none of them of especial note as breeders, and the highest prices were not paid for the best animals, except in the cases of the bulls and the Guernseys. It is clear that a good many people have been desirous of buying good imported Jerseys, and so were willing to pay prices considerably above what equally good animals could be imported for. So shrewd a buyer as EDWARD FOWLER paid not more than £30 a head, on an average, for the lot. The cost of setting them down upon the dock in New York was not over £20. When reliable parties, good judges of these breeds, experienced as importers and as breeders, stand ready, at any time, to import to order, or go out and fill orders by personal selection, at a profit to themselves of $30 or $40 a head, it seems wild to pay such prices. It is certainly not too much to say that an equally good average lot of twenty animals, of either breed, may be landed here at about $300 each.

THE
RURAL NEW-YORKER.

PUBLISHED EVERY SATURDAY.

Address
RURAL PUBLISHING CO.,
178 Duane Street New York City.

SATURDAY, FEBRUARY 2, 1878.

We earnestly request that all letters containing money, or any communication intended for the BUSINESS DEPARTMENT *of the paper, be addressed to the Editor, the Publisher, or* THE RURAL NEW-YORKER, *and not to any individual. We cannot otherwise guarantee the prompt entry of names upon our books, or the acknowledgment of money.*

A NUMBER of our subscribers have written us that they have seeds of the Shell Flower (Moluccella laevis) raised from the seeds which we sent them. We would feel obliged to such subscribers if they would state the quantities they have, and the prices at which they may be purchased.

WE announce to our readers with unusual satisfaction that B. PICKMAN MANN, the distinguished Entomologist of Cambridge, Mass., will contribute regularly to our entomological columns. Since his return from Brazil, where, with AGASSIZ's recommendation he was commissioned by the Emperor to investigate the injury caused to the coffee plantations by insects, he has devoted himself to Entomology as a profession, and his connection with many of the foremost societies of this country, has given him exceptional opportunities of keeping a-breast with the latest developments of that science.

THE MSS. of "Horticulture and Education," by Prof. I. P. ROBERTS, No. IV., reached us too late for publication this week. We present our readers, therefore, with the essay of Prof. THOS. J. BURRILL, upon Diseases of Apple Trees and Fruit, already alluded to. This is the tenth of the essays, announced last year, by the Professors of our Agricultural Colleges, which we have published up to this time. It is valuable alike to the scientific and to the practical farmer.

A MOVE IN THE RIGHT DIRECTION.

WHILE confident of the excellence of a man's intentions, it is a thankless task to point out their impracticability, as we had reluctantly to do of late with regard to the project of cultivating tea in this country, advocated by our enthusiastic Commissioner of Agriculture. Another subject on which he is even more earnest, is a more extensive cultivation of sugar-cane in those districts adapted to its growth. In this matter we fully sympathize with his efforts, and very sincerely trust they may be successful. There is within the limits of the Gulf States an area suitable for the profitable production of this crop, large enough to yield not only a sufficiency for our domestic wants, but to furnish a considerable surplus for exportation. To utilize this, will keep in the country the vast sums now exported to enrich other nations by the purchase of this necessity of modern civilization, afford a remunerative investment to much of the capital now lying nearly useless, and needed employment to thousands of the starvelings now compulsorily idle in every part of the country.

Presidents, Senators, and Representatives from time to time, graciously avow that the agricultural interest of this country, is the most important interest in it—important alike to its progress and prosperity; and having patronizingly made this concession, these official worthies seem to think they have generously done all the agricultural community has any right to expect from them. For years the lawyer, the banker, the railroad speculator, and the politician, have shaped the policy, controlled the offices, and expended the revenues of this country mainly for their own interests, while the farmer has borne in silence and without influence, the heaviest part of the burden, and will continue to do so until he asserts his own manhood, and insists as a matter of right, upon an influence in governmental matters proportionate to the importance of his avocation.

The Commissionership of Agriculture, the RURAL has more than once insisted, should be a Cabinet Office, as it is in the most advanced European countries. Indeed it is not improbable that the attention of the nation would have been long ago directed to the necessity for this, had the incumbents of the office been men of energy and resolution. Despite some minor failings, we are glad to notice that the present Commissioner is zealous and earnest, that he seems to have a just appreciation of the position his office should hold, and while his efforts are as untiring as they seem to be of late, we shall not cavil at small blemishes, but heartily aid him to promote the best interests of the body he represents.

WHAT MAKES THE DIFFERENCE?

SOME persons often express surprise that their neighbors are enabled to succeed better than they do. SMITH complains that he works as many hours in the day and as many days in the year as JONES does, but somehow things don't seem to get ahead with him, while JONES evidently keeps his farm and buildings in as good condition, and saves money every year.

If we will observe these two men a single day, we shall doubtless be able to discover the screw that is loose—for certainly there must be something wrong somewhere.

If we visit JONES' tool-house, we find everything in good order and in its proper place. When he is ready to commence his day's work, he can lay his hand at once upon ax, shovel, or hoe.

SMITH has no tool-house; when he wants anything, he tries to remember where he left it when he last used it, and the half hours he spends in this way, amount to many full days in the course of the year; and beside, there is a great difference in the condition of the tools when found. One set is bright and sharp—the other rusty and dull. With his sharp ax, JONES will fell a giant of the forest in much less time than SMITH can with his dull one, and with the expenditure of much less strength.

JONES makes intelligent observations of the weather. If it promises to be dry, he plows low lands, and if wet, he makes calculations accordingly. He determines what crop to plant or sow with judgment, and after mature deliberation; he never makes a move for which he cannot give a reason.

SMITH works mechanically and with little judgment. He plants and sows without regard to present state of the market or the prospects for future demand, and wonders how it is that some folks are always lucky. He is a believer in fate or fortune, while JONES works in the belief that Providence helps those who help themselves.

Has JONES a quantity of fruit to prepare for market, he selects the choicest and ships that by itself and the less desirable, in another lot after rejecting entirely the poorest. In this way he receives quite as large a price for his second rate, as SMITH does for any, while his best being extra, bring the highest rate the market commands. He has learned by experience that a few small, inferior apples in a barrel give a bad repute to the rest, and that it is more profitable to feed them to stock or even to throw them away, than to use them to help fill the barrel—and it is the same with everything. JONES finds the time spent in keeping things neat and in order, most profitably employed. SMITH thinks it time wasted. The result is, everything about the one place is attractive and pleasant while the other is slovenly and neglected. The neighbors see why it is that JONES is successful, while SMITH, with as good advantages, accomplishes so little with much more labor.

It is not the horse that takes the most steps that travels furthest in a day, nor the man who labors the most hours that accomplishes the greatest amount of work. A little energy properly directed often attains results sought in vain by muscle without mind, and a little judicious planning is of more real service in overcoming obstacles to success, than the mere worker has any idea of. When intelligence and physical force come in competition it is easy to predict which will win.

TO BRIDGE OVER.

WALKS about the house and through the garden, to the barn and to all much frequented places are of as much consequence as anything else that adds either to comfort, tidiness, utility or beauty. It is of little consequence how well arranged or elegantly kept everything else is out-of-doors, there is that about soft walks that disturbs the best of tempers and, though the sun shines brightly and the air is bracing, one takes to the house as, between it and the muddy walks, the lesser evil.

Dry walks in the winter are dependent upon conditions which cannot always be controlled. If the land slopes from the house in every direction, they may be formed at a small cost. Sand or gravel or both, with enough of coal siftings to bind, are the main requisites. But if the land is flat or nearly so, a system of drainage is the first necessity and even then the walks, to be dry in winter, had better be dug out to a depth of a foot or so and filled in according to directions which have often been published in these columns.

At this time we had it in mind simply to suggest to those who are begirt with muddy walks now that little can be done to better them, that hemlock planks laid double, side by side, leaving two or three inches between and placed upon cross-pieces two or three inches square, will bridge over the difficulty at a very small cost. In the spring, after the ground has become settled, they may be utilized according to the needs of the premises.

OSAGE ORANGE.

MR. FALCONER, in one of his articles this week (p. 71) mentions that Osage Orange trees in the gardens of Gen. SARGENT are growing luxuriantly where anything else would starve. We have them growing in parts of our grounds which are so sandy and dry that the grass burns in early summer and, though but three years planted in their present positions, they promise to eke out a comfortable existence. Such facts are worth remembering. We know of grounds upon which large sums have been expended in the purchase of trees and shrubs in great variety, a considerable proportion of which—in spite of the best of care—have died, are dying or are so dwarfed and distorted that they are not worth the ground they cover. Had the proprietors known at the time of selecting and planting what trees were suited to a sandy, bottomless situation, the expense and trouble to that extent might have been avoided.

To the lover of shrubs and trees, it is a sad sight and a provoking one to find after planting and years of waiting and watching and pruning and doctoring and hoping, that there is naught to show for it. It lessens his interest in the home he tried so hard to beautify.

Better an Osage Orange that will respond to one's labors than a Purple Beech or a Golden Oak that, after one or two blinks of promise, is snuffled out by the first relentless drought.

NOTES.

Western N. Y. Hort. Society.—We have given in our practical columns a liberal space to the report of the recent meeting of the Western New York Horticultural Society and have only to regret that we could spare no more, as the proceedings were of unusual interest. President BARRY remarked that instead of being discouraged by the obstacles to fruit culture which seem to be constantly increasing, we should simply be incited to greater vigilance. "If fine fruits could be grown without effort, they would soon be of little value." This is true, but it is also plain that the cost to make the needed efforts must not be greater than the value of the fruit when so produced. But after reviewing the ravages of Doryphora upon the potato—of the Hessian Fly upon the wheat crop, etc.—he concludes that the horticulturist and fruit-grower have no more than their share of obstacles to contend with. He thinks the prospects of the orchardist in Western New York were never more encouraging than at the present and advises the planting of the apple, "under proper conditions" with as much confidence as ever.

For Discussion—Sanitary laws for our homes—What farmer's gardens are and what they should be—Small fruits for family use—Trees for the lawn, the farm, the roadside—The adaptation of fruits to soils—The best evergreens for home decorations—The best trees for small grounds—The value of experiments in the farm and garden—The value of botanical studies to country children—are among the topics which we think worthy of discussion at our farmers' clubs, agricultural and horticultural conventions, and in the family circle.

BREVITIES.

GEN. GRANT noted during his ascent of Vesuvius that, when the lava had rested for a long time, and become mingled with the soil, "good crops sprang up."

THE Herald says that Vesuvius smoked a little during Gen. Grant's call upon it, which was the only honor paid our ex-president by the haughty volcano.

QUAIL served on toast, cost a restaurant proprietor twenty-five dollars, a day or so ago. We wish that the fine for supplying game out of season were twice as much, and that those who eat it might be fined as well as those who sell it.

WE regret to hear of the death of Mr. Horace Gilbert of Auburn, N. Y., who died of heart disease. He was one of the most efficient agents the RURAL had in the locality, and was esteemed and respected by an unusually large circle of friends.

WHEN a seedman offers his catalogue free to all applicants it is a very good guarantee that he at least has faith in it. WM. H. CARSON, 125 Chambers street, T. M. THORBURN & Co., 15 John street, both of New York, and J. B. MINER, Linden, N. J., thus offer their catalogues and we advise our friends to avail themselves thereof.

MR. CRUZAN'S article upon the much discussed Chinese Yam (Dioscorea batatas) shows how widely tastes and experiences differ. Very few of the many who have given it a trial, entertain any other opinion than that it is valuable chiefly to the amateur who does not measure very carefully the relationship between labor and its results. For ourselves, we can only say that we value it highly as an ornamental vine.

WE think that all good Christians — even though they were holding grain in anticipation of an appreciation in the price, on account of the Russo-Turkish war, should give thanks that terms of peace have been arranged. It has not been a feather in the hat of our Christianity that we have talked less of the terrible sufferings that this war has caused and entailed, than of the effect it was likely to have upon our grain markets.

MR. H. B. ELLWANGER, in an address before the Western N. Y. Hort. Soc., very aptly puts the irrepressible longing after novelties, manifested by many lovers of flowers: "Among the devotees of Flora, there is a class of people of a restless, enthusiastic nature, who, not content with the good things they already have, are ever craving for something new: they are not satisfied with adding to their store, from time to time, such novelties as have been subjected to trial and found valuable, but are ever ready to be off with the old love and on with the new." But there are other devotees, besides those of Flora, who are too ready to give up their old, tried friends in favor of those they know little about.

BUSINESS NOTICES.

SEE Mr. MINER'S adv't of White Grapes and other fruits—something new and valuable.

Literary Miscellany.

MISTAKEN.

JOHN HARDY.

I was only a little broken-hearted
Yesterday,
When he and I so coldly parted
On our way.

I had thought his words of kindness.
Some meaning bore;
It was all my foolish blindness,
Nothing more!

I do not think that I shall sorrow—
Not much, at least;
I shall meet him on the morrow,
My love dream ceased.

One of my foolish fancies only
Passed away:
And perhaps I feel a little lonely—
Just to-day!

HER MOTHER'S SECRET.

[Concluded from page 62.]

"AFTER a while, I became more habituated to her and the girl, and began to like her. Then I took up the idea of marrying her to my nephew.

"But he settled that by choosing for himself—my own daughter.

"Hark! the messengor has returned," he cried and truly, in a few minutes, Martha entered, carrying the desk.

The Baronet snatched it from her like a famished wolf. She would have remonstrated, but Linton took her on one side, and whispered, "Her father!"

"Heaven save us!" said the poor woman.

The Baronet wanted no keys. He opened the desk without difficulty, emptied all its contents on the table, and then, setting to work for a few minutes, produced a secret drawer.

"See," he continued, tearing open an envelope and producing a medallion of himself; "this is the portrait I showed her, but which I did not leave about while my father lived, and this is my marriage certificate, *her* copy, which I put for safe keeping here."

All looked amazed.

"Read it out, Royston," said the Baronet; "every word."

He did until the end, when the signatures proved to be Alice Estcourt and Arthur Mortimer Tressider, with the address Longmead House.

"Forgive me, Sir Arthur," cried Linton, humbly, "I have done you great wrong."

"Say no more," continued the Baronet, quietly; "and that we may find my daughter, summon my so-called wife."

This was done, and Lady Tressider came hurrying in, to see her husband, not dying, but seated in a chair, surrounded by gentlemen, and with papers before him.

"Be seated," said the Baronet, calmly. "I have a very important communication to make to you, and a very disagreeable one. Nay, you need not speak; you will have plenty of time presently."

Lady Tressider smiled scornfully.

"I am sorry to say that when I married you my first wife was living. She only died six months ago," he went on; "and that the young lady whom you persuaded to leave this house under false pretences is my only daughter and heiress. Under the circumstances, it is you who have no business here."

"My business is in the police-court!" she cried, rising furiously; "and to one I shall go to get a warrant against you for bigamy!"

"Hush, woman!" said her supposed husband, sadly and coldly. "If any warrant is to be obtained, it will be one against you for attempted poisoning. Behold!" he cried, pointing to the five glasses which had been suddenly put on the table; "into every one of these I saw you put the deadly drug which was to take my life. Two have been analyzed, and the poison is known. Shall I send to a police-court for you?"

"Mercy! Mercy!" she cried.

"Or shall I send you to Rome, give you up to the Italian police, and have the body of your first husband exhumed?" he continued.

"I have nothing more to say," was her sullen reply. "Give me over to the police."

"No; but leave my house—pollute it no longer by your presence," he added; "and never let me see you again."

She turned as if at bay, but the words died upon her lips. She was utterly crushed and beaten.

Half an hour later, after collecting all her jewelry and her banker's book, she and her daughter slunk away, to be seen no more by any one in that house.

Sir Arthur had to retire to bed, but in two days more he was again about.

CHAPTER XIV.
The Search.

Now began a thorough search for the poor unfortunate girl, who in the very spring-time of her happiness had fled none knew where. The police were unanimously of the opinion that she had changed her name and fled abroad, when they might as well search for a needle in a bottle of hay.

Advertisements were tried; but, as is well known, these never serve the purpose unless they are expected.

But, stimulated by the almost fabulous reward, the detectives kept on.

Sir Arthur grew thin, but refused to go to Longmead until his daughter was found.

We may here mention that Longmead Hall was the mansion of the village in which our narrative commences; but, by some fatality, Sir Arthur never visited it. The second wife's time was given wholly to Paris or London.

Otherwise, one accidental meeting might have prevented much misery.

Royston Yorke became moody and irritable. He frequented the most unlikely places, places where certainly no one like Edith would hide.

But he was sullen and miserable, and tried walks through every quarter of London.

Wrapped in a loose great coat and slouched hat, he traversed every thoroughfare, and often looked so close into women's faces that he was threatened with the police.

But the police began to know him.

One evening he was going up a street in St. Giles's near St. Martin's Lane, when a cab dashed by with great velocity, knocking down a man.

Some rushed after the cab, but Roystsn helped to assist the man into a surgeon's. He was a poor, wretched-looking being, but the heart of our hero was always open to the poor and the outcast.

"Is he dangerously hurt?" asked Yorke.

"We'll see. He'll want some mending," was the half careless reply. "He's a fit subject for a hospital—such as he is."

"But it's only a fractured leg," said the young man. "I'll pay all expenses if you'll get a room and see to his wants."

Money in St. Giles' goes a long way, and the poor fellow was soon comfortably housed and attended to, five pounds being handed to the surgeon.

Now, Royston Yorke was very good-natured in all cases, but here he had a motive. He had recognized in the unfortunate man his quondam rival and attempted murderer, Jack Clayton.

He went away musing on the instability of things, and then returned home.

Next day he called to see the patient.

"Well, and how are you now?" asked Royston.

"You!" gasped the patient—"you not dead? Don't say you put me here—that you saved me from the hospital?"

"I recognized your face at once," answered Yorke.

The man could not speak, and the surgeon coming in, the conversation dropped.

"Sir," said Jack Clayton, humbly, "will you come back this evening, and I may have something to tell you you may wish to know?"

Royston Yorke promised, and going away, returned at a later hour.

The room was poor, but clean and well lighted up. Jack Clayton was no longer the same being.

"I have always thought you were dead," he said, "though I might have known different for the asking. But as it is, I have led the life of a hunted murderer."

"Very foolish," replied Royston.

"I see it now; but I always was a mad fool," he went on. "Now will you tell me, in a few words, the truth about Miss Emily Marshall? I have heard tell and want to know."

With a bounding heart, Royston Yorke told all, and at great length.

"Then she is the daughter of Sir Arthur?" he asked; "and you, his nephew, really mean to marry her when you find her?"

"That I do!" cried Royston.

"There!" said Jack, thrusting a paper into his hand; "take that, and ask for Miss Wilson. Say you come from Jack, who is hurt."

Royston Yorke gave one bound, and was down stairs, where he read the address of some obscure street in Islington. He reached the place by a cab, and found himself outside a small shop.

He went in as calmly as he could, and seeing a middle-aged woman, said he had an important message from Jack to Miss Wilson.

She pointed to the back parlor, and Royston darted in just in time to see Edith trying to retreat.

"My darling," he said, catching her in his arms, "you escape me no more! Come, put on your shawl and hat; your father is dying to see you: come!"

Well, it was not very easy to resist, and probably she did not try much.

Away—away, in a cab, to alight at the old familiar house in Eaton Square. But the ride was long, and Royston was able to tell all in outline. But that we know.

She explained that knowing herself to be looked after by policemen, and seeing rewards offered, she had determined never to go out until the hue and cry was over.

"I thought it all came from your generous love," she said, tenderly; "I little suspected the truth. Ah! how happy I am to know my father is a good and honorable man, as my mother believed him!"

"But what about Jack?" asked the lover.

"Well, he was simply very devoted, and I used him as a messenger; let him run errands."

"And never spoke about me?" he asked, reproachfully.

"I did not like to," she answered.

"And let him think himself a murderer?" was the farther reproach.

"I daresay I am a very bad girl, and not worth thinking about!" she said.

The meeting between father and daughter is too sacred to be recorded. They were left an hour alone, and then Royston was admitted.

A few days later they all started for Longmead, taking Jack Clayton with them.

He had sown his wild oats, and was gladly welcomed back by his delighted family.

Soon a handsome tomb was seen, recording the virtues of Alice, Lady Tressider.

Before Christmas, her daughter Edith became Mrs. Royston Yorke Tressider, and the future Lady of the same name.

But that event has not come off yet. The Baronet lives happily surrounded by his children's children, and thanks Heaven every day that he discovered "Her Mother's Secret."

ON THE KATTENAESE.

BY CAROLUS.

I was sitting one afternoon some summers ago *unter den eichen* (under the oaks), near a little wood lying at the foot of the hills, and skirting the road that leads to the village of Harzburg, in which spot I was spending my vacation, and persuading myself that I was regaining health and strength from its weak saline baths. It was four in the afternoon—a hot, sultry day. All nature seemed enslumbered; promenaders were few and lazy. The shopmen, in their rustic booths, looked indolent, and unmindful of purchasers; the band treating us for the second time that day to the overture to "William Tell," played about a score more wrong notes than was their wont. As for myself, I was leisurely sipping a cup of coffee, idly amused by watching the mountain stream that runs through the wood and the village. The brooklet was gushing merrily past, hopping and skipping over small and large stones, forming here and there miniature cascades, gurgling, murmuring, leaping along; kissing the pine-roots that struggled into its waters, playing with the rushes on its bank. It seemed the only animated thing around.

Looking up, I saw a girl approaching the place where I sat. She was tall and well built, wore the usual peasant dress and neat print bodice, scrupulously clean, and a short woolen skirt, and carried on her back a long, broad basket, called in the Harz a *kiepen*, which enables the bearer to carry burdens without fettering the hands. She seated herself next me, took the *kiepen* off her back, and sighed deeply, as though she had got rid of some heavy burden.

I turned to look at her. It was a fine face, noble in expression; her hair, which seemed luxuriant, was twisted in coils of rich brown plaits around her head, and one was laid across the front, forming a coronet that made her clear, well-defined features stand out in good relief. Her exhausted, heated aspect struck me when, a few moments later, she bent down to the brook, catching some of its water in her hollowed hand. I said, "Do not drink water—you look warm. Let me offer you a cup of coffee."

She raised her head, surveyed me wistfully for a moment, and then, seeing that my offer was sincere, rose and said, curtseying, "If the Herr really means it."

"Certainly," I replied. While she was drinking, I said, "You are tired and warm. Have you been far to-day?"

"Nearly half way to the Brocken, Herr," she replied. "I have been getting food for our cow; the poor thing is ill, and cannot get it for herself. Everything is so scorched here in the valley that we must go far up the mountains before we find fresh food."

Suddenly a heavy hand was laid on my shoulder from behind, and a deep masculine voice, choked with passion, said, hoarsely, "Have I found you at last, you villain? If you are not too great a coward, meet me at the Kattenaese to-is afternoon; we shall be alone and undisturbed there."

Before I could reply the speaker was gone, and a second later I saw, from between the trees, a wagon driving along the high road at a furious rate. I turned to the girl at my side. She had risen, and was readjusting her *kiepen*; her

WINTER SPORTS.

face was aglow, and her eyes filled with tears.

"Do you know that man?" I asked, as soon as utter amazement would let me find words.

"It is my *schatz* (sweetheart)," she replied, simply, struggling to speak without agitation.

"Ho, ho!" I thought. "The fool sees me sitting here under the trees next his love, and immediately thinks I'm paying attentions to her!" The idea quite tickled me. Very many years had fled since I had been considered dangerous.

"Tell him when you see him," I said, "that he is wrong in being jealous, as I suppose from his conduct he is. Say an old man offered you a cup of coffee. Go and say so, my girl."

"He is doing his master's work," she answered; "I may not go to him now. Besides, Herr, he has hardly spoken a kind word to me for the last week, and just now he glared at me so fiercely."

At these words she fairly broke down, and burst into tears. I tried to console her, but an old fellow like me is not clever in love affairs. Presently she grew calmer; and, wiping her eyes with her apron, she once more curtseyed, and bade me "Good morning, and good thanks, Herr." To turn the current of my thoughts, which at that time were not of the pleasantest description, I determined to ascend the Burgberg, the mountain nearest the village, the view from which well repays the slightly fatiguing ascent.

When I had seen my fill of the view, I rose and surveyed the remains of the castle that stood here formerly, and the site of which is now occupied by an elegant hotel; and then, recollecting that I had ordered my supper early, determined to retrace my way.

I had gone but a few steps downward, when I came to cross roads, and saw a signpost whereon was inscribed the direction to the various points accessible thence. On the board to the left was written, "Zur Kattenaese."

"Kattenaese!" I repeated to myself, reading the words; was not that the name mentioned by that man this afternoon? I had forgotten all about him till then. I wonder what the Kattenaese is, I thought. It had never for a moment occurred to me to go and meet the girl's lover; I hoped the matter was long since cleared up between them. But, now that I saw the name, it tempted me to go. It was not far. I wanted a walk. Perhaps the man might be there, and I could clear up his mistake.

Then, too, I remembered to have seen some large weird rocks jutting out at the top of a mountain within view of my sitting-room window; and when I asked my landlady about them, she said they were the Kattenaese. I was half-way already and could not know when my old and lazy bones would carry me up here again, so I turned in the direction indicated.

The walk led between tall pines along a moss-grown path, and I exulted and delighted in its beauty and in the fragrant odor emitted by the trees. The silence was intense, and grew oppressive at last; the heat, too, was great. Presently I felt some drops of rain; it must be a very heavy shower, I knew, that could penetrate these clustering trees; but seeing from another signpost that I was not far from my destination, I determined to proceed.

At last I emerged from out the sheltering trees, came on to a large open space, and saw two large rocks about a hundred yards ahead of me. These then, were my destination, but although so near it seemed very doubtful whether I should get to them, for it was raining heavily.

Unwillingly, and with a kind of relief, I turned to leave the spot and regain the valley, by descending the mountain's shapely sloping side.

Hardly had I commenced my descent when I fancied I heard sobs. At first, on standing still to listen, I held it to be the wind's soughing; but, on listening more attentively, I distinguished a human voice. To leave some poor fellow creature—perhaps suffering pain—alone here in the storm was beyond me; so I began to search for the spot whence the sounds proceeded, and, following their direction, came after a few seconds upon a little knoll of pines, where a man in working clothes was seated. His face was buried in his hands, his powerful frame shaken by sobs. He did not notice my approach, and I hesitated whether I ought to break in upon his grief. He was praying—praying aloud, and his words were full of agony.

"Oh, great Heaven," he said, "take her not from me—mine own, my only treasure! Let not a David rob me of my sweet ewe lamb. Pour better feelings into my heart. O, Lord, let me not bear him malice; but oh, let him not do me wrong! Preserve her to me—to me, kind Heaven—to me!" Here sobs and tears choked further utterance.

The rain continued to pelt down; the water was pouring in small streamlets down the mountain side; I wished to continue my way, and yet could not leave this man in the midst of his misery. He might do himself an injury. From the wording of his prayer, too, it might be the man who had proposed to meet me here. I approached gently, and touched him on the shoulder.

"My good fellow," I said, "you are getting wet. Come down into the valley with me; we are having a frightful storm, and this soaking is enough to make one ill."

"None would care if I were," he replied, without raising his head. Then after a few moments, during which I stood immovable, he said, "Why don't you go? I never asked you to wait for me. I don't know who you are. If I die that will be the best thing for me, and one may perhaps be glad." His head, which he had lifted wearily, and with a half-vacant expression as he spoke the last words, fell again into his hands.

"Who will be glad if you die?" I asked. "None, I feel sure."

"Who are you that you can be sure?" he said, fiercely. Then, suddenly starting to his feet, he cried, "Perhaps you are the man I came to meet: if so, it is well. Ha, ha! Heaven favors quarrels to-day. Tell me, how have you dared for some time past to pay such marked attention to my girl? Nay, do not try to deny," he said, as I was about to speak. "I know it all, though I did not see you myself. Hans Herden told me of your conduct; and though I never used to love or even trust Hans, I now thank him greatly for this warning. You shall pay with life for your daring! "I will——" and he raised his arm to strike.

"Stop!" I said, as gently and softly as I could, laying my hand on his. "You are mistaken, my friend—you are indeed."

"Mistaken! how?" he cried, shaking free his arm—an easy task, for he was a far stronger man than I.

"I am the man you came to meet," I began.

"Did I not say?" he shrieked, his wrath rising threefold.

"But," I added, once more detaining his uplifted arm, "not he who paid your girl attentions."

At that moment a fierce, dazzling flash of lightning shot across the gloomy heavens, and a long, loud crash of thunder followed. The man trembled.

"Let us go down," I said, again placing my hand on his trembling one, and he yielded. "I never saw the girl till this afternoon," I explained, as we descended; "I then offered her a cup of coffee, for she was warm and tired. Look at me. See, I am an old man—old enough to be her father. Acknowledge your mistake."

"Hans Herden said it was a gentleman that courted her," was the answer given while eyeing me incredulously.

"If I give you my word of honor as a gentleman that it was not I, will you then believe?" I asked.

"I could not misdoubt that," he replied.

"More still," I said; "if I promise to aid you in your search for the real culprit?"

"Sir," said the man, turning an astonished, grateful glance upon me, "you are good. I do not deserve such goodness: I was a brute to you. But oh, Herr, I love Margarete so dearly, and although all prospect of our marriage seems yet far off, the thought that I was losing her was more than I could bear."

"Why can you not marry?" I asked. "But come, walk faster while you talk; this rain is fearful, and the storm increases in violence."

"Ah, Herr, it is money I need," he replied; "that old and constant complaint. If I had a few hundred thalers, ah then—— But till I have saved so much years must pass."

"What is your work?" I asked.

"I am a waggoner," he replied. "When I have a waggon, horses, and house of my own, then I can marry."

I pitied the poor man from my heart. All the way down the mountain he poured out his griefs to me, and as he did so his wrath cooled. I forgot even the inclement weather in my interest for Johann (that he told me was his name). His deep love to his betrothed was touching; and it seemed to me, from his narrative, that he had been perfectly goaded into jealousy, as until lately he had the firmest trust in her faith.

"You shall hear from me again," I said as we parted; "that is to say, if I survive this rain."

After exchanging my wet garments for dry and warm ones, and partaking of my retarded supper, I caused my landlady to come to me, and questioned her as to the man and woman I had met that day. She could not speak in terms laudatory enough of their faith, honesty and worth.

"And who is Hans Herden?" I asked.

"A driver at Herr A——'s," she replied; "and between ourselves, Herr, I think a bit of a scamp. He's been far too polite to Margarete lately, but she's the right one; she'll soon teach him his place."

I made a mental vow here, dismissed and thanked my hostess, and retired to rest.

Next morning, while sitting in the pretty garden before the house I lodged in, taking my breakfast in the true Continental style, *al fresco*, Margarete passed and I beckoned to her.

"Is it all right between you and your intended?" I asked.

She hung her head and replied—"He says, since it is not you, it must be some one else—that Hans Harden told him so, and that he will find it out. He hardly gives me a kind word. But I must go to work," she said suddenly, after a moment's pause.

I readily forgave her the little falsehood. I saw that she could not control her tears, and for that reason wished to escape.

After she left I went to Herr A——'s, and, through his kind intervention, obtained a private talk with Hans Herden. The man was dogged at first—I could get nothing from him; and he constantly questioned my right of interference—in which respect I felt he was not quite in the wrong. I was an old busy-body, after all, though a well meaning one. Threats availed little—a sense of shame seemed unknown to the man; only a bribe of money was at last successful in drawing a confession from him.

It was as I had thought—the man admired the girl himself, and hoped, by stirring up his comrade against her, to break off the match then he would endeavor to win her for himself. His only chance lay in such means, as he well knew her faith and integrity. He was a horrid man—the most obnoxious I had come across for many a long day. But I did not rest satisfied with the confession given to me—I forced him to go to his fellow-worker, and in my presence repeat it. At first he appeared disinclined to do this, but the sight of some bright thalers in my hand decided him.

The lovers must soon have become reconciled, for that evening I saw them walking together arm-in-arm *unter den eichen* in the moonlight. They were far too absorbed in each other to see me; and I, who had been *deus ex machina* in reuniting them, was alone—unnoticed—forgotten. Heigho!

Next day I went to Brunswick, where I employed my time in making purchases, and returned a few days afterwards, when I heard that both Johann and Margarete had several times been to call upon me, to thank me as they said. I told my landlady to say, should they call again, that there was no cause for thanks; but, before they could do so, I visited them at a time when I thought it likely that Johann would be at the house of Margarete's mother. I drove up to the cottage door in a strong-built blue cart with bright red wheels, drawn by two stout bays. Inside the cart I had caused household furniture, the fruit of my late purchases, to be packed.

They both exclaimed with joy when they saw me alight, and the old woman pressed me to take some supper with them. I accepted their offer, ordering the cart to wait.

We had a cosy little meal of simple, frugal fare. Before parting I lifted my well-filled beer glass in my hand, and said, rising, "This to your happiness, Johann and Margarete! Think of me sometimes—a lone old bachelor, who knows no joy like yours." Then, emptying the glass, I bade them follow me, and once outside the door, I showed them the cart and its contents. I explained to them that it was all for their future household, and, turning to Margarete, and pressing a thousand-thaler check in her hand, I said, "This is for your dowry."

Before they could recover from their mute astonishment I was gone. Vainly they called after me—I would not hear. I rushed to the railway station, and departed by the next train. The sight of their happiness had overpowered me, and I did not wish to receive thanks, which I knew were inevitable should I stay longer in the place.

I wrote to my landlady to forward my luggage, which she did, sending at the same time a letter from the happy lovers, full of the deepest gratitude, in which they called me their benefactor, and prayed me to come back once more. But I had not strength enough for this: I could not. It is a great happiness to help others on the road to joy, but, if one can never learn that joy oneself, it is better not to witness it, for it only makes the pang keener and sharper.

ANCIENT MODES OF EMBALMING THE DEAD.

Herodotus and Diodorus tell of three modes of embalment prevalent in Egypt. The first was very costly, answering to about $2,000, exclusive of such gems, jewels, and gold, as love or prodigality might lavish upon the dead; the second, $300; the third, within the reach of all. As to the extent to which gems and jewels were wound up in the cerecloth to deck the dead, there is the instance of the queen lately found at Thebes, whose ornaments were shown in an exhibition of 1860. They are now in the Pasha's Museum. Their intrinsic value alone—that is, to break up and melt down—is about $10,000.

It is curious, in reading the two historians' accounts of the Egyptian embalmer, to observe in divers matters the foreshadowings of the modern undertaker in his ways. The different degrees of woe were then, as now, sounded according to the depth of the purse. Just as it is now, when the furnisher will undertake for you any gradation of sorrow from the simple elm coffin and pauper funeral up to the flourish and parade of plumed hearse, weeping mutes, and prancing steeds, so with the Egyptians. Only the manner was different.

When a bereaved mourner, they tell us, went into one of these Egyptian shops, the functionaries would show him different models in wood highly and artistically finished or otherwise, to represent the mummy and coffin. There were painted patterns of mummies in their multicolored cases to choose from. The various costs, according to pattern, were then stated. The customer chose his model, and the bargain was struck. He then went home and sent back the dead body, and the body remained with the embalmer until the whole process was completed. The number of days requisite for embalming was, as we gather from both historians, seventy or seventy-two, and this tallies with the Scripture account—Gen. 1-3; for doubtless the immediate process only occupied part of the time, the rest being given to the ritual of mourning.

The processes for embalment are related very categorically. In some things they hardly commend themselves to our present sentiment of what is respectful to the dead. The chief secret seemed to consist in certain chemicals injected into the veins and body; in certain washings and steepings in natron, and in the filling up of the cavity of the body with myrrh and other balsamic substances and spices. The brains were drawn out through the nostrils. Sometimes the face and hands were gilt. Certain jewels were laid on the breast under innumerable swathings of linen. And then a kind of pictured shell received the body—a sort of close-fitting case made to open and shut lengthwise after the fashion of a violin-case.

But when the mummy was sent home, what then? The family did not immediately part with it. On the contrary, they often kept their dead relative for a long while, a guest in his own house. A room was set apart. The mummy, standing upright as in life, was enshrined in a kind of painted cabinet, a tabernacle starred over with innumerable hieroglyphics, and protected with great painted scarabæi and multicolored cherubim, with their overshadowing wings spread athwart the chest. Hither, then, at intervals, the family would come to hold communion with the dead. They would bring fresh lotus flowers to enwreath their silent relative, or strew about the ground blossoms of asphodel and papyrus.

Numberless paintings in the tombs of Egypt picture this affecting scene—a mother and her children kneeling in circle with the dead in their midst, or a wife with plaintive face and dishevelled hair embracing the placid-looking mummy of her husband. Listen to what Diodorus says: "A clever embalmer," he writes, "would send back the body perfectly preserved, even the hair of the eyelids and eyebrows remaining undisturbed; the whole appearance so unaltered, that every feature might be recognized. The Egyptians therefore, who sometimes keep their ancestors in magnificent apartments set apart, have an opportunity of contemplating the faces of those who died long before them, and the light and figure of their bodies being distinguishable, as well as the character of the countenance, they may enjoy a wonderful gratification, as if they lived in the society of those they see before them."

RESPECT FOR THE AGED.

NELSON RITTER.

Some one has truly said, that "To ridicule old age, is like throwing cold water in the morning into the bed in which we must sleep at night." Old people have a right to demand that they be treated with respect; but are they not under great obligations to be pleasant, agreeable, and—as far as possible—cheerful? Failing in this, is it any wonder that neglect and disrespect sometimes follow? Old people should be held in reverence by the young, especially if there is anything worthy of reverence about them; but each man and woman should see to it, that as they grow old in years they do not grow out of all sympathy for their children and grandchildren. No person, because he is old, has a right to be selfish, sullen, and morose.

Said a little boy, "Ma, will grandpa go to heaven?"

"Yes, my son, I hope so; but why do you ask that question?"

"Because, ma, if grandpa goes to heaven, I don't want to go there. He would say, 'Whew! whew! what is this boy bothering around here for?"

A short time since I read a long article, written to show that it was our duty to love old people. The writer described her great love for an aged grandfather, and proceeded to give a minute description of him, investing him with so many virtues that not to love him—or any other person such as described—would be an impossibility. I thought that to love such a person would be more of a pleasure than a duty. Every neighborhood has its old person who, although bowed down with weight of years, still has a warm heart for the young and a kind word for the children.

No need for the word "duty," to cause such people to be sincerely loved and respected. Again, every neighborhood has its representative, from whom the children instinctively spring away, as from a plague. Persons that little girls are afraid to meet, whom the boys give a wide berth to, and whom no person desires to encounter. Even a long newspaper article, in which all the changes are rung upon the word "duty," will fail to cause such unsympathetic people to be respected, much less loved.

Let us all, therefore, resolve that whatever be the number of our years, we will be true to the right, kind and sympathetic to all, especially towards the weak ones of earth, whether they be in their first or second childhood. Doing this faithfully, we shall be loved and respected all along the pathway of life. And when the end comes, may it be said of us, as says Sir Walter Scott in his vivid description of "King Rene:"

> "A mirthful man he was; the snows of age
> Fell, but they did not chill him. Gaiety,
> Even in lips closing, touched his leeming brain
> With such wild visions as the setting sun
> Raises in front of some hoar glacier,
> Painting the bleak ice with a thousand hues."

Syracuse, N. Y., Jan. 4, 1878.

PROSPERITY AND ADVERSITY.

Years of each have been the lot of many, and it would be hard to say which, in some cases, is the most dangerous to a man's welfare, even in this world.

The first mentioned often causes a man to hurt another's feelings. As he prospers he begins to study his own interests, ignoring the comfort of every one whom circumstances have placed under his control. He begins to order about like a great commander, and thinks it very smart to shift his employes from job to job, and giving them no reason for doing so. He will be tyrannical wherever he can, and he is often even so in his own family. He thinks he is a superior kind of a being, and many crafty, cunning, but dishonest-hearted men, will humor this assumption, and pander to his conceited notions for the purpose of cheating him, which they will easily do, until they become too venturesome and too covetous; or one in the ring of confederates proves treacherous and shows up the other to get first chance himself.

These prosperous men then begin to distrust

everybody and their own judgement: but pride holds them back from acknowledging weakness. They are miserable: and many another man in adverse circumstances is far happier, and enjoys better health, sleeps better at night, and lives to enjoy life years after the other had left his wealth to be squandered by his heirs.

It is well when one of the few "live and let live" men prospers, for then he is happy himself and tries to make others so. As men of this good disposition makes a sunshiny existence for many of those who are brought in contact with him, and he has the good will of everybody, while the selfish, miserable man who wants to take advantage of everybody, is hated and detested beyond measure. The man in adversity moves lower down than formerly, but having once got settled into the lower grade, finds himself much more comfortable than he expected, and if he does not unfortunately, get placed in a situation under one of the opinionated, smart, domineering class, he comes round in time to be a respected member of society, and enjoys peace of mind and long life. Sometimes these prosperous men become so wretched, and feel the pangs of remorse to such a degree, that they will end their lives by their own hands.

How much better then it must be for any man who has fortunately commenced to make money to let the poor enjoy some of it, and instead of beating them down in their wages, to pay them well and have their love instead of hate!

S. B. P.

BRIC-A-BRAC.

BY C. H. E. R.

SHALL I not be forgiven for repeating good Fuller's words, even though they may jar a little upon some wedded ears? "Deceive not thyself by over expecting happiness in the married state. Look not therein for contentment greater than God will give, or creature in this world can receive—viz., to be free from all inconveniences. Marriage is not like the hill Olympus, wholly clear, without clouds. Remember the nightingales, which sing only some months in the spring, but commonly are silent when they have hatched their eggs, as if their mirth were turned into a care for their young ones."

WE have seen many beautiful tributes to lovely woman, but the following is the finest we ever read: "Place her among the flowers, foster her as a tender plant, and she is a thing of fancy, waywardness, and folly—annoyed by a dewdrop, fretted by the touch of a butterfly's wing, ready to faint at the sound of a beetle, or the rattling of a window-pane at night, and she is overpowered by the perfume of the rosebud. But let real calamity come, rouse her affections, enkindle the fires on her heart, and mark her then! How strong is her heart! Place her in the heat of battle—give her a child, a bird or anything to protect—and see her, in a relative instance, lifting her white arms as a shield, as her own blood crimsons her upturned forehead, praying for her life to protect the helpless. Transplant her in the dark places of the earth, call forth her energies to action, and her breath becomes a healing, her presence a blessing. She disputes inch by inch the strides of a stalking pestilence, when man, the strong and brave, pale, affrighted, shrinks away. Misfortune haunts her not, she wears away a life of silent endurance, and goes forward with less timidity than to her bridal. In prosperity she is a bud full of odors, waiting but for the winds of adversity to scatter them abroad—pure gold, valuable but untried in the furnace. In short, woman is a miracle, a mystery, from which radiates the charm of existence."

IT has always seemed to me that the wedding ring has not been developed to its full capabilities. It should always bear on its inner surface some neat and appropriate inscription. It is best to put it on the inner side because friction will gradually obliterate the letters, just as the mental friction, will efface the sentiment, the longer the devoted couple remain together. It is seldom she calls John Anderson my Jo John, when his locks are like the snow, but rather lassoes him with a string of complaining epithets, whose burden is that there is no wood in the house, and he sits around doing nothing industriously while the ax is rusting in the shed. Now in the Middle Ages, and to the close of the 17th century, it was the custom to embroider love with written sentiment. Here are a few models that may be modified for use at the present time:

"Pray to love, love to pray" (1647).

"Divinely knit by grace are we:
Late two, now one; the pledge here see" (1657).

"Ever love; love the giver,"

"My promise past shall always last;
In Christ and thee my comfort be."

"Happy in thee has God made me."

"Most yn myud and yn myn heart,
Lothest from you for to depart.
My heart and I until I die."

"If I think my wife is fair,
What need other people care!"

"I did commit no act of folly
When I married my sweet Molly."

"I cannot show the love I O."

"Let him never take a wife
That will not love her as his life;
Love one little, but love one long."

"First love Christ, that died for thee;
Next to Him love none but me."

For Women.

CONDUCTED BY MISS FAITH RIPLEY.

MY QUEEN.

ALFRED SULLY.

QUEEN of my life,
Upon my heart's most guarded wall
The sentry waits thy royal call;
For thee the gates wide open swing,
For thee the bells their welcome ring,
For thee—"The Queen!"
For thee, my love, my life, my queen!

Queen of my love,
With royal grace of tenderness,
Thy sweet lips speak alone to bless,
Each passion of my nature stands
Obedient to thy loved commands—
For pure, serene,
Thou reign'st of all my life the queen.

Queen of my home,
Thy castle, though too mean for thee,
Holds treasures worth a kingdom's fee,
Enthroned in thy womanhood;
In all things pure and sweet and good,
Thou reign'st serene—
My children's mother and my queen!

VEST, COLLAR AND CUFFS.

FIGURES 1 and 2 represent an arrangement which is like a *plastron* vest, with cuffs to place on outside the wrists of long coat sleeves. The

FIG. 1.

vest is made of Italian lace insertions joined together with a very tiny Hamburg insertion of Swiss muslin, and a narrow Hamburg is also upon all the outer edges. A ruffle of Italian edging passes about it and the center of the front has a ruffle arranged on each side of the Hamburg insertion to form a cascade or *jabot*. The closing edge which is underneath has tiny buttons upon it and little button-holes are made in the strip which is ornamented, but both the buttons and

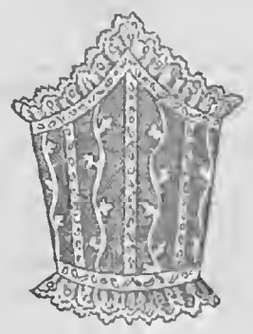

FIG. 2.

button-holes are invisible, because of the drooping of the laces. The back of this vest may be pointed or somewhat square like a sailor collar or Pompadour, that is narrowest at the lower edge. To make it, cut a model of stiff or firm paper and baste the insertions to it, beginning with the outer one and permitting the others to be cut as required. Baste the seams carefully, with the parts upon the paper, and then remove and stitch them with a machine. The edges beneath the cascade may be of Swiss muslin, if the Hamburg insertion be not abundant. The insertion which is folded into the required shape at the back; must be neatly overhanded afterward and the double part cut away on the under-side. A wider lace upon the edges adds much to the elegance of the vest.

FIG. 3. FIG. 4.

At Figs. 3 and 4 are shown collar and cuff of double cambric or linen, with embroidery in English wheel-work upon their edges. Some ladies who cannot accomplish this work rapidly, purchase an edging that is pretty serviceable, and then transfer it to the collar and cuffs which have been cut to a shape which fits and pleases them. To do this, cut away the cambric, but not too closely to the wrought figures, baste it firmly to the position where it is wanted to be, and overhand or buttonhole the inner line of the work to the outside of the article. After this is done, cut away any rough edges of the cloth, which still attach to the ornamental part, and also cut away the undesired projecting portions of the collar and cuff material, that still remain underneath. Linen collars that are made and turn over *a la* BYRON, or those in English style, are equally popular. Both forms are worn with outside cuffs or inside straight cuffs, and also cuffs that flare.

Neckties of shaggy silk and embroidered ties of silk, muslin, and lace, are fashionable.

THE BABY SHOW.

MRS. POTIPHAR.

IF it had not been demonstrated, one would hardly have conceived it possible that there could be found in this age women so lacking in self-respect as to exhibit themselves *as mothers*.

There are those who profess to be shocked at woman's asking for a right to the exercise of the elective franchise. Whole tomes have been written about the indelicacy of woman's going to a polling place to deposit a vote—where she would attract no more attention than she does now in public conveyances, in church, or the theater. These same sensitive people have been further outraged by woman's practicing law, and their rage attained the superlative degree when, in defiance of St. PAUL and more modern ecclesiastical authorities, she has asserted her right to act as CHRIST'S ambassador and *tell* the gospel message from the heretofore zealously-guarded pulpit. On all sides she has been denounced as unsexing herself, as coarse, wanting in delicacy and utterly destitute of modesty, because in these various ways she has sought to prove her right to be the peer of her brother in the kingdom of mind. In all this she asked to be considered as an intellectual being, and men have derided her.

Where were these fastidious folks during the baby-show epidemic? They uttered no protest, and it is consequently fair to suppose that these sticklers for modesty in women saw no impropriety in these shows. I put it to you candidly, which is the more indelicate—exhibiting one's-self and one's offspring *as animals*, or carrying CHRIST'S message of pardon to a sin-stricken world?

The mere fact of a woman's giving birth to a child, entitles her to no special consideration or respect. The females of all created things share this power with her. It has nothing to do with her intellectual or spiritual life. It pertains solely to her lower or animal nature. What ennobles and refines motherhood, are the all but God-like qualities that are developed in the woman—the infinite tenderness, the utter self-abnegation, and it is because of my profound admiration and respect for the motherhood of the world that I am indignant at women prostituting what should be the most sacred and the holiest relation of life by exposing themselves and their innocent children to the ribald jests of miscellaneous crowds.

Any woman possessed of the least possible delicacy, must have been grieved at the tone the daily papers assumed in reporting the baby-shows. The exhibited—mother and child—were talked of much as though they were cattle. The press, however, was not to be blamed. The women voluntarily made of themselves targets for all the jokes and the not always chaste allusions that were made.

Setting aside the question of delicacy, what good is accomplished by these displays? Cattle and dog shows are made to serve a useful purpose. The visitors have an opportunity to compare the different modes of breeding, and the result is a more intelligent care of stock. Will any one pretend to assert that the next generation of babies will be any the better born or bred for the shows of to-day?

Imagine the withering scorn with which one of the exhibiting mothers would meet any such suggestions: and yet, if they chose to put themselves and their infants on a level with dogs, cats, and cows, it hardly behooves them to grow indignant when people very naturally fall to instituting comparisons.

DANCING.

[From the New York World, Jan. 14,]

ALMOST without exception, New York physicians agree that dancing, inclusive of the waltz, is *per se* harmless. Almost as unanimously they condemn certain of its common accessories or some of the physical conditions under which it is done. The indigestible midnight supper is bad, but not the dancing; the foul air and draughts are bad, but not the dancing. As to the immorality, they don't believe in it. The views of several clergymen are presented also and speak for themselves.

The venerable Dr. Erasmus E. Marcy, of No. 1 West Thirty-fourth street, N. Y., said that he was in favor of all kinds of innocent recreation. "There is no doubt," he continued, "that the conditions which surround dancing are sometimes the cause of serious physical injury. Especially is this true of the exposure of thinly clad women to drafts and the cold air. But this evil is not directly chargeable on dancing, since ladies go to the opera and the theatre and to dinner parties in full dress. As for dancing *per se* I think it an innocent and healthy recreation. I have always said that we did not have half enough recreation in this country. People will insist upon working too many hours a day and devoting too little time to recreation. I think that billiards at home, dancing, sociables and all similar pleasures are the greatest need of the nation. In many years of practice I have found the people who have attained an advanced age, are the people who have always been happy and jolly, and while taking good care of themselves have at the same time been given to pleasant recreation. I look upon every one who encourages the introduction of English sports, such as riding and shooting and walking, in the light of public benefactors. I think, in short, that if you were to put it to the vote of the physicians of this city you would find a very large majority of them were in favor of dancing.

"I think that, as far as the idea that the contact of the sexes in dancing gives rise to improper thoughts is concerned, it only exists in the prurient imaginations of the people who write the books containing such suggestions, and that the only people who could indorse such work must be those who retain the old Puritanical notions which existed in New England when I was a boy. All the dancing I have ever seen has been done with delicacy and propriety."

Dr. M. H. Henry, of No. 157 West Thirty-fourth street, said that dancing was not injurious in itself; it only became so under certain conditions which surrounded it, and in its accessories. But these accessories might be more properly spoken of as belonging not to dancing especially, but to all evening entertainments. "There are times," he said, "when taking an extraordinary amount of exercise is injurious, but this is equally true of walking or riding to excess as well as dancing, except it be that the latter presents greater temptations to the taking of such exercise than the others. American women are poorly nourished improperly fed as a rule, and they are improperly dressed, although in that respect there has been some improvement lately. For these reasons they are not strong. Then there are certain periods when a women is totally unfitted for taking any exercise whatever. At such times French women and English women very largely go to bed and stay there, while American women go out and dance and walk to excess. The walking is as bad as the dancing, and both are very injurious. Then there are the suppers which are furnished to people at dancing entertainments—ices freezing cold, greasy salads, coffee boiling hot, and the like. These of course, are injurious to anybody. I have not read the book on dancing entitled 'The Dance of Death,' but I have read extracts from and reviews of it, and I think that such books are likely to do more harm to their readers than dancing will ever do them. I think, to sum the matter up, that dancing in properly ventilated rooms is a healthful exercise."—Concluded next week.

CHAOS.

LILY HEMLOCK.

THE RURAL gentlemen seem to admire the "quiet corner," but is there any prospect of peace while "Lances" and "Sword Sticks" are so freely used? My limited acquaintance with human nature has proved such weapons unnecessary, at least in Ruraldom.

We admire "Sword Stick's" *nomme de guerre*; it suits the article admirably—improves it. He says "Ermengarde" is guilty of ridicule.

Medecin, guerts-toi toi-meme!

"Sword Stick" imagines the ladies to be a composition of flowers and feathers, laces and silks, generally, and fashion plates in particular. I'll leave the gentleman to wrestle alone in his might with the products of fancy, while I attempt to deal with realities—the something beneath the dry goods that is made of better material; something that *can* and does train children to lives of usefulness and honor; and that provides for them the necessaries of life while the father, *who needs to make no excuse for his faults*, is squandering his children's bread and his wife's earnings at the dram-shop or gambling table.

On the other hand, the "bread winner" deserves much more respect than "Jacquelina" gives him. The "staff of life" must be earned or obtained in some way, and if "Jacquelina" could know how hard were the struggles, and how noble the impulses in the heart of him who wins it honestly, she would not only surrender the "coolest corner" in her home to him, but the warmest place in her heart, and deem the offering inadequate, and be thankful that the sacredness of a comfortable home shielded her from the temptations, the anxieties and the uncertainties of business. "Each for the other and both for the Master," Jacquelina.

"Sword Stick" says: "It is a glaring fact that, after marriage, many wives are more intent upon avoiding a family than upon preparing for the physical advancement of another generation." But is it not a glaring fact that, after marriage, many men are more *intent upon having families than upon providing for them.*

But this habit needs no excuse!

"The clothing of our children depends upon the fashion." Only too true. Look at school-girls! Who ever thought of sending boys two miles to school in winter, with such shoes as the girls wear. Preposterous! If farmers did not get boots for their boys the State would.

But the girls! They can't wear boots—they are too heavy! It seems to be beyond human comprehension that girls need something to wear as well as boys do.

Parents have money to pay Professors and M. D.'s to talk about "Sex in education;" time to read articles upon "Insanity among farmers' daughters," etc.; but they have not the courage to get proper clothes for their girls, nor the time to think that the only wonder is that girls have minds at all, when so regardless of health.

The Querist.

ANSWERS TO CORRESPONDENTS.

Shell Marl.

T. G., Naples, N. Y.—Draining a piece of swamp land, a few weeks ago, I found, about twenty-four inches below the surface, a bed of marl (that is, a decomposition of small shells), containing, I think, many thousands of tons. Will the RURAL please to give me some information in regard to the following points, viz.: (1.) Is this marl of any commercial or manurial value? (2.) Will it improve muck land, if put on in its natural state, or is it necessary to have it burnt? (3.) Can you tell me of some easy or inexpensive way to burn it?

ANS.—1. Yes. Such deposits of shells are often nearly pure carbonate of lime, and frequently contain, in addition, animal and vegetable remains and soluble salts. They also generally contain silicious matter, chiefly derived from the shells or sheaths of infusorial animals, which absorb silica from the water in which they live, instead of lime. This is the most valuable kind of marl.

2. If applied alone to muck land, its effect is beneficial, as it acts chemically upon the semi-decayed vegetable matters, which contain crenic and gallic acids, giving the woody fiber highly antiseptic properties. The alkaline matter of the marl neutralizes these acids and thus hastens decomposition. Generally, on exposure to the air, marl of this description soon falls into very fine powder, like slaked lime, and can, therefore, be at once incorporated with either muck, sandy or clayey soils, or else advantageously composted with manure.

3. It is only rarely that shell marl is burnt or caloined, and then it resembles quick-lime in its action. But as all the valuable organic matters are lost during the calcining process, this mode of preparation is only advisable where shell-marl is intended to be used as a substitute for quick-lime, which is not generally the case. Probably as cheap a method of burning it as any, would be by the construction of an inexpensive little lime-kiln for that purpose.

Gas Lime.

H. S. H.—Would the lime that is used by gas-works be of any use as a fertilizer? I have asked a number of farmers; they tell me it is of no use. They claim that the sulphur that gets in the lime from the gas passing through it takes all the good qualities out of it. Please tell me through the RURAL whether it still retains any fertilizing properties?

ANS.—As with many other fertilizers, the value of gas lime depends on the manner of using it. As it leaves the purifier it is a mixture of sulphuret of calcium, with carbonate of lime and a variable quantity of unneutralized or caustic lime. In this condition it is mischievously injurious to vegetation and should, therefore, never be employed in a fresh state. By exposure to the air the sulphuret of calcium absorbs oxygen and becomes sulphate of lime or gypsum, in which state it is innocuous, and may be beneficially applied under the same circumstances in which the application of plaster-of-Paris would be advantageous. In all cases it should be allowed to remain exposed to the air at least three months and turned over occasionally. If composted for a few months with refuse matter, such as weeds, sods, leaves, chips, or other porous matter, chemical changes take place that will render it of considerable value. Applied to stiff, clayey soil it is mechanically beneficial by opening it up. In no case, however, can it be more than about half as valuable for agricultural purposes, as freshly burned lime; and this should be taken into consideration before incurring the expense of purchasing and carting it.

WILL "A Victim" send his name and address? not for publication, but as a guarantee. We cannot seriously consider charges made anonymously.

Subscriber, Lynchburg, Va.—I see very many valuable and interesting answers to questions in your paper. Can you give me any preventive or cure for a horse that is gradually going blind? He is a young horse—only four years old—and has never been injured by work in any way, and seems to be quite healthy in other respects. His sight is not gone very much yet. Can you tell me the cause of his losing it while so young?

ANS.—The colt has not had sufficient exercise, and had too much feed. Feed less but regularly, and give it regular and plenty of exercise.

D. C. P.—I was told by an acquaintance that there was a catalogue published in New York City of all unclaimed estates in Europe. Can the RURAL give me its name and the address at which it is published?

ANS.—The Herald Almanac has always published a list of heirs wanted, and as most of such announcements appear in the advertising columns of that paper, the list is generally pretty complete and is probably that referred to. At any rate we know of no other.

N. E. M., Morris Co., N. J.—What book on poultry can you recommend as a full and complete guide to an amateur who is investing in poultry as a business just to make money. I would prefer a recent work if as full and reliable.

ANS.—We have answered the above questions several times within the year, and now again say that the work of Mr. STODDART advertised in our columns, is as good as any with which we are acquainted.

N. B.—L. F. Abbott would oblige editor by sending his address.

L. P. Moore, Danville, Pa.—Can the RURAL give me the P. O. address of its correspondent, G. R. Drake?

ANS.—We do not feel privileged to give the addresses of our correspondents. This is inserted so that Mr. Drake can comply with the above request.

John Parkhill, Fayette Co., Pa.—Can the RURAL give me any information in regard to Pulvermacher Chain Belts or Galvanic Co.—are they a humbug or not? Their address is 212 Broadway, corner Fulton St., N. Y.

ANS.—The Pulvermacher Co. is quite trustworthy, and we believe the belt is a good thing; it is said to be so by good doctors.

News of the Week.

CONDENSED NEW YORK TELEGRAMS.

TUESDAY, Jan. 22.—The House refused to pass a Bill to pay the Customs in greenbacks. Mr. Hewitt proposes to abolish the diplomatic service, assigning the duties of Ministers to Consuls. Long discussion in the Senate about remonetization of silver.

Trains from Adrianople are overcrowded with Moslem fugitives. The Servians have captured Pristina and Kurschumli—Turkish loss, 400 killed and wounded and 450 captured. In the latter town 24 Servian soldiers and two officers were found impaled. The Turkish peace plenipotentiaries have at length arrived at Kezanlik.

WEDNESDAY, Jan. 23.—A grand Requiem Mass was celebrated at Washington, for the soul of Victor Emmanuel. The President, Cabinet, and Diplomatic Corps, and many Senators and Representatives were present. A part of the Nez Perces are reported to have again started on the war-path. Some more murders on the Rio Grande by rangers and unknown outlaws.

Austria is satisfied with the Russian terms of peace, and has waived her objection to a Muscovite occupation of Constantinople. There is a general panic in the latter city, and it is said the Turks have resolved to accept any terms that may be offered, regardless of British and other outside interests. Suleiman Pasha has arrived at the seacoast at Drama, with the bulk of his army, and will thence embark his forces for Gallipoli, which he will defend to the last extremity. The Russians have gained a considerable victory near Erzeroum in Armenia. Up to January 10, the Russian loss amounted to 82,195 men. The Chinese have captured Kashgar. More English troops are needed to suppress the revolt in South Africa.

THURSDAY, Jan. 24.—Grave charges have been made against Mr. Seward, Minister to China, by Meyer, late Consul at Shanghai, and these have been referred to the House Committee on Foreign Affairs. Gen. Sherman has written a very complimentary letter to J. Q. Smith, ex-Commissioner of Indian Affairs, saying that he has proved the most efficient officer in that position during the last ten years. Schurz, who has just removed Smith for inefficiency is by no means pleased.

Peace parleying has begun at Kezanlik, but the Russians have postponed stating their conditions until Tuesday. They are reported to have arrived at Keshan, 26 miles from Gallipoli. The Italian fleet has been ordered to the Levant. Germany and Austria are evidently in substantial accord with Russia. The Grand Duke Nicholas, will be in Adrianople on Sunday. The marriage of King Alphonso with Mercedes, third daughter of the Duke of Montpensier, was celebrated with great splendor at Madrid yesterday.

FRIDAY, JAN. 25.—Senator Lamar delivered yesterday a very able speech against the remonetization of silver. Ex-Secretary Bristow was given a complimentary dinner last evening by Pres. Hayes. Numerous bankruptcies and merchantile suspensions, notably of leather dealers in Philadelphia.

Russia has submitted the terms of peace to Germany and Austria, and exacted a promise from Turkey not to disclose their nature. England is highly indignant at having been excluded from the confidence. If the Russians attack Gallipoli or Constantinople, England will certainly go to war, to prevent the capture of those points. Austria is satisfied that her interests will not be endangered, but believes that those of England will be affected sufficiently to cause her to interfere, and therefore is urging a modification of terms. In the event of certain information of the Russians advancing against Gallipoli, the commander of the British fleet in the Mediterranean has been ordered to land enough of marines and sailors to save the town from capture. In the late battles Gen. Gourkho captured 2000 wagons and 97 guns belonging to Suleiman Pasha's army, and split this force of 40,000 men in two. One part under Faud Pasha, fled into the mountains, and the other under Suleiman Pasha, retreated towads Baskol pursued by Gen. Skobeloff and Karzoff. Great commotion in England, and indeed throughout Europe.

SATURDAY, Jan. 26.—The Mathews Resolution, favoring the remonetization of silver, passed the Senate by 43 votes against 22.

The Turkish delegates have been ordered to sign peace preliminaries. Besides an addition of territory, Russia claims $100,000,000 or its equivalent in territory. The Earls of Carnarvon and Derby have resigned from the British Cabinet, on account of its belligerent attitude. Resignation of former accepted, that of latter withdrawn. In spite of England's bluster, there is little prospect of her going to war.

SUNDAY, JAN., 27.—Anderson, Kenner and Casenave, of the La., "Returning Board," who some days ago took refuge in the New Orleans Custom House to avoid arrest for their action in returning the election of President Hayes, have been surrendered to the Sheriff by order of Attorney-Gen. Devens and are now lodged in prison: Wells is not to be found. Talk, talk, talk, and nothing else in Congress.

The British fleet having been ordered to Constantinople, received a counter-order on reaching the mouth of the Dasanelles, and has returned to Besika Bay. No news of an armistice yet. Austria and Germany intimate that the peace conditions should be submitted to the European Powers, as all are interested in them. The Greeks are clamoring for war, as they now feel that had they gone to war earlier they would now receive an increase of territory. An appalling famine is raging throughout four Provinces in the north of China. Nine million people starving. Children publicly sold in the market places for food. Assistance begged.

MONDAY, January 28.—A United States force has been invited by a Mexican officer to pass over into Mexico in pursuit of cattle thieves.

The preliminaries of peace between the Turk and Muscovite have been signed. Terms: Bulgaria to have a governor appointed by the Porte, forces of latter to be withdrawn to stipulated localities; independence of Roumania; local autonomy of Bosnia and Herzegovina; independence of Servia, with compensation of territory; Montenegro to retain all she has gained during the war. Russia to possess Batoum, and receive an indemnity in money or territory. British Ministry still persists in asking for £6,000,000 supplementary credit to prepare for eventualities. The Pope is again prostrated.

HOME NEWS PARAGRAPHS.

There are over 300 artesian wells in Santa Clara Valley, Cal.

Vermont has 75,200 horses, valued at $5,329,429,-00. Average valuation, $70,86½ each.

The French trials have resulted in giving General Fremont a complete release from all obligations.

A hog was killed at Beloit, Wisconsin, the other day which weighed nine hundred and sixty pounds.

Throughout the cotton-producing States, the average yield of cotton per acre is 178½ pounds, valued at $19.64.

One cent per bushel makes a difference of $10,-000,000 in the value of the annual crop of corn in the United States.

The Legislature of Washington Territory has a young lady engrossing clerk. She engrosses not only the bills, but the attention of several susceptible legislators.

Agricultural labor occupies 306 women in N. Y. State; one woman is a bee-raiser; 49 are dairy women; 2,139 are farmers on their own account; 58 are florists and 60 are gardeners.

At a recent farmers' meeting in Massachusetts, a speaker gave a receipt for making farming pay, as follows:—"Have but one business and get up in the morning and see to it yourself."

The Murphyites have taken the town of Louisiana in Missouri by storm. Over 2,000 persons, half the population of the town, have donned the blue ribbon, and still the work goes on.

The value of the ore reduced and marketed in the Black Hills in 1877 is estimated at $1,500,000. The yield of the placer claims has been less than last year, and will not probably exceed $1,000,000. This makes the total product of the Black Hills for 1877 about one-fourth as much as that of California.

It was Rochefoucauld who said "The common folbie of women who have been handsome is to forget that they are no longer so." And the same cynical philosopher advised: "Treat your friend as though he might one day become your enemy, and your enemy as if he might one day become your friend.

There is said to be a difference of opinion between General Sherman and his wife on the subject of dancing. The lady cannot convert him to her opinions. When he goes to balls he dances incessantly and merrily. But it is not asserted that he indulges in the waltz, otherwise than the "dance of death."

During the past year the consumption of cotton reached the highest point ever attained in the States, while the value of the cotton fabrics exported has, despite low prices, increased $6,000,000 within two years, or from $4,000,000 for the fiscal year ended June 30, 1875, or $10,180,000 for the fiscal year ended June 30, 1877.

After the failure of the Sprague of Rhode Island, about four years ago, for $8,500,000, the creditors accepted notes bearing interest, and payable in three years. The interest was paid for two years, but since then the creditors have received nothing. They have formed an association for the purpose of concerted action.

Of the 88,239 arrests made by the police of New York City last year, 64,955 were males and of these 44,261 were unmarried. The ripest age for disorder and crime with both sexes, was from twenty to thirty. Persons between those extremes arrested, numbered 29,256, against 21,599 under twenty, and 20,218 between thirty and forty.

Governor Wade Hampton has written to Colonel Lee Crandall, president of the National Immigration Bureau, of this city, commending that enterprise as far-reaching in its scope and one that cannot fail to be of great service. He says "It should be fostered by the agricultural bureaus of every State and Territory, and I shall endeavor to keep it before the people."

A statistical report to the Montgomery County, Ohio, Horticultural Society, on the 12th inst., shows that 880,000 acres in the State are in apple trees, yielding an annual average of 12,000,000 bushels; that the State averaged 100,000 bushels of pears annually; and that 10,000 acres are in grapes, producing an annual average of 9,000,000 pounds, yielding 700,000 gallons of wine.

The imports at New York for 1877 were $329,800,-000, or about $34,000,000 advance on last year's, but less than for any other year of the previous six, and a hundred millions less than for the year 1872. The imports of specie were $15,000,000 against $26,000,000 the previous year. The exports were $326,431,000 for the year, an increase of about $8,000,000. The export of specie was $27,500,000, against $43,000,000 in 1876, and $67,500,000 in 1875.

From 1850 to 1871, 215,000,000 acres of public lands were granted by Congress to States and corporations for railroad purposes; 150,000,000 of this to the Pacific roads, and nearly 5,000,000 acres have been granted for canal purposes; for the Pacific roads a debt of $24,000,000 was assumed, now swollen to $92,000,000, and promising to exceed $150,000,000; and the largest grantee proposes to pay the government by practically borrowing anew from it.

The United States Senate gains another handsome man in General J. S. *alias* "Cerro Gordo," Williams, Kentucky's new Senator-elect. He is fifty-four years old, six feet four in hight, and large in proportion, carries himself with a certain careless grace, and is the picture of a dashing cavalier. Though a Union man before the rebellion, he joined the Confederacy immediately on the outbreak of the war, and became a Brigadier-General. His oratorical powers are highly commended.

FOREIGN NOTES.

When Victor Emmanuel became Sovereign of Sardinia in 1849, his territory had an area of 28,76 square miles and a population of 5,167,542. He has left a kingdom whose area is 114,295 square miles, with a population of 26,801,154.

Mr. Mecht, the famous scientific farmer of England, estimates that fifteen hundred sheep folded on an acre of land for twenty-four hours, or one hundred sheep for fifteen days, would manure the land sufficiently to carry it through a four years rotation.

Lieut.-Col. Playfair, British Consul-General in Algeria, reports that the changed condition of Tunis is due to the extensive destruction of forests which has taken place since ancient days Vast plains now covered by arid sands were formerly well wooded.

The "blue glass" mania has reached England, and rages fiercely. There are the usual number of wonderful stories of cures, especially of the insane. As in this country, one species of insanity is very quickly cured by a few trials, and that is the blue-glass lunacy itself.

"Hog-guessing" is an amusement which has recently broken out in the rural districts of England. It differs greatly from the crude guessing at old-time slaughterings. Then dumb-luck ruled. Now it is reduced to a science, the guesses being made from computations based on careful measurements and records kept of the weight of animals previously slaughtered, and even the matter of the kind of feed the hog may have been fattened on, is taken into account. The best guess wins the hog.

Happy tidings for nervous sufferers, and those who have been dosed, drugged and quacked. Pulvermacher's Electric Belts effectually cure premature debility, weakness and decay. Book and Journal, with information worth thousands, mailed free. Address PULVERMACHER GALVANIC CO. Cincinnati, Ohio.

VARIOUS.

It is asserted that, notwithstanding the unusual rains, the sugar crop in Cuba will exceed the last crop in quantity and quality.

The husk of wheat contains as much as six per cent. of oil, whereas fine flour contains scarcely more than one per cent.

One hundred parts of wool are chemically composed of 50.65 carbon, 7.03 hydrogen, 17.71 nitrogen, and 24.61 parts oxygen and sulphur.

Corned mutton is extensively used in foreign countries. There is no good reason why it is not in general use here. For cooking with vegetables there is no meat superior to it.

The dressed carcass of a calf weighing 150 pounds contains 93¾ pounds of water, and 56¼ pounds of dry substance; the latter quantity is made up of 6¾ pounds of mineral substance, 2¾ pounds of dry nitrogenous substance and 24½ pounds of fat.

In these days of bank failures it is safest for the farmer to make his deposits in banks of rich soil and more manure: buy improved stock instead of bank stock, and the only shares he should indulge in should be to share with his wife and family the comforts of a good home.

The production of tobacco has recently become a very important agricultural interest in Pennsylvania. It is asserted that the State now produces more tobacco than the Connecticut Valley, and it is believed that in a few years its crop will be larger than that of Connecticut, Virginia and Missouri. The yield of Lancaster county last year was 18,400,000 pounds,

In South Holland a good cow will produce, during the summer months, about twenty-six pounds of butter. In the high pastures of Scara, in Switzerland, the yield during the ninety days of summer is about forty pounds, or less than half a pound per day. In Holstein and Lunenburg 100 pounds is considered a fair return; and even in England, 160 to 180 pounds annually, or from eight to nine ounces per day, for ten months in the year, are accounted an average produce.

Premature Loss of the Hair, which is so common nowadays, may be entirely prevented by the use of BURNETT'S COCOAINE.

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Jan. 26, 1878.

BEANS AND PEAS.—Receipts of beans past week, 9,869 bbls.; Exports, 1,253 bbls. The season continues decidedly averse to trade in mediums, and prices are again off. Marrows still quoted at the late decline. There is considerable objection to the lack of uniform quality in marrows; this is a severe drawback to steady export business. White kidneys are easier, in sympathy with marrows. Red ones firm for moderately sized lots. Pea beans dull and much lower. Black beans dull and much lower. Black beans nominal at $1.50. Green peas are down to $1.30 as a selling figure. Canadian field in bulk and hand quiet at 83@83½c.; some extra in store held higher.

We quote:—Beans, medium choice, $1.75@1.75; other, $1.50@1.65; marrows, choice, $2.15@2.20; other, $1.95@2.05; pea, $1.60@1.85. White kidney, choice, $2.00@2.20; other, $2.95@3.05; red, choice, $2.55@3.60; other, $2.35@2.40. Turtle soup beans, $1.50. Limas, $3.

BEESWAX.—There is a light inquiry from shippers. Sales at 27@23c. for Western and Southern.

BROOM CORN.—There is a fair inquiry, and prices firm.

Green brush at 6@7c.; green hurl, 6@7c.; medium green, 5@6½c.; red-tipped, 4@5c., and common red, 3@3½c.

BUTTER.—Fine lines or lots of State have a steady if not active movement. While the fancy or picked-out portions have a settled position that is unlikely to be interrupted until the season closes. Some buyers object to the advance that has attended good table grades, following the new gilt-edged prices. They contend that buyers of highest quality have an outlet that is disinterested in prices. While they as less pretentious distributors have to shape retail prices in accordance with the times. Useful stock is becoming broken up a good deal in order to make a duplicate grade of previous purchases, and sellers insist on compensation when they permit extra trying. Some dairies are quoted at 3c. but there are not enough of them regular quotations, 28c. is still a good quotable extreme. Western factory is in good supply, chiefly selling at 18c. for prime a few selections bring 20c. The baking or packing demand is very moderate this winter and the fact adds to the stagnation that has so long prevailed in common qualities. By the term packing demand we refer to dealers for West Indian use. English shippers are calling only for actual wants, paying 14@18c. for stock that is all right and might be useful here. Fresh Western dairy made could be placed at 25@27c. if faultless. Rolls in large supply and dull.

We quote State fancy pails 28@30c.; other 25@30c.; creamery, gold to choice, 26@33c.; half tubs, fine, 28 30c.; extra, 33@35c.; other, 22@27c.; Full Welsh 27@29c.; Welsh tubs, dairy, 24@26c.; other, 20 24c.; full dairies, fine, 26@28c.; common, 20@24c.; firkins 20@26c.; poor State, 12@18c.; Western creamery, good to choice, 28@30c.; poor to good 25@32c.; Factory, choice, 18@20c.; good, 16@18c.; common, 7@11c.; rolls, 12@17c.; grease, 6¼@7c.

Receipts for the week, 17,658 pkgs.

Exports past week, 1,303 pkgs

CHEESE.—Exports for the week have been 31,013 boxes. The export demand is fair, and on some of the selections an advance has been made; 13½c. can be made easily for fancy factories, and some selections reach 13¾c.

Fancy factories, 13¼ 13¾c.; good and prime, 13@13¼c.; fair lots, 12¾@12¾c.; poor, 10@10½c.; 7@10c., skimmed. Farm dairy, 12@12¾c. for good to prime; 10½@11½c. for fair lots; 7@10c. for skimmed; Western factory, cheddar, 13@13½c. for fine 11@12c. for good; 5@9c. for poor.

Receipts for the week, 33,467 boxes.

Liverpool cable, 63s. 6d. Gold closes 101¼.

COTTON has been unsettled, and closed steady.

Latest prices are for January, 10.35@10.37c.; February, 10.38c.; March, 11.13@11.14c.; April 11.27@11.28c.; May, 11.40c.; June, 11.52c.; July, 11.60c.; August, 11.6?@11.67c.; September, 11.37@11.45c.; October, 11.18@11.20c.; November, 11@11.05c.

Quotations for spot cotton are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted.

	Uplands.	*Ala.*	*Orleans.*	*Texas.*
Ordinary	8¾	8¾	8¾	8¾
Strict ordinary	9¼	9¼	9⅝	9⅝
Good ordinary	9⅞	9⅞	10	10
Strict good do	10 6-16	10 5-16	10 7-16	10 7-16
Low middling	10⅜	10⅜	10⅝	10⅝
Strict low middling	10 15-16	10 15-16	11 1-16	11 1-16
Middling	11⅛	11⅛	11⅛	11⅛
Good middling	11⅜	11⅜	11⅜	11⅜
Strict good middling	11⅝	11⅝	11⅝	11⅝
Middling fair	12⅛	12⅛	12⅛	12⅛
Fair	12⅝	12⅝	12⅝	12⅝

Stained.

Good ordinary, 8¾c.; Strict ordinary, 9¼c.; Low middling, 10c.; Middling, 10¾c.

DRIED FRUITS.—There is a fair jobbing business, and prices generally steady.

Apples—State quarters, old, 5@6¼c.; new, 6¼@6½c.; Western quarters, old, 6@6½c.; new, 6@6¾c.; Southern, new, prime sliced, 7c.; fair to good, 5@5½c. Peaches—Peeled, new, 11@12c.; unpeeled halves, 4¾ 5c.; unpeeled quarters, 4@4¼c. Pitted cherries, 15@17c. Blackberries, 9@10c. Raspberries, 27c. Plums, 16c.

EGGS.—Receipts for the week, 5,486 barrels. The market ran down seriously during the week, and the decline led to better business. The unsold surplus of old accumulations form a severe pressure upon the market. Retailers will not risk them, and will not deal liberally in fresh fearing they may be what is expressively termed "shuck" with detrimental quality. Just as soon as consumers suffer inconvenience in their kitchens by unreliable eggs they at once reduce purchases. Poultry and meats have ruled remarkably low and even cheap eggs have had to give up some of their current business.

Near points, 17@18c.; State and Pennsylvania, 16@—c.; Canadian 12@13c.; Western, best, 15@16c.; other, 12@13c.; Southern, 10@12c.; Limed, State, 12@13c.; Canada, 10@12c.; Western, 9@11c.

FEATHERS.—Live white prime Western geese, 45@47c.; mixed, 30@40c.

FEED.—Is more freely offered and easier. Sales 40 pounds ave. $20.00@20.50; 60 pounds ave. $19.50@20; 80 pounds ave., $20@21; 100 pounds, $20.50@22; and rye at 19@20.

FLOUR.—Prices have been reduced leading to a more active market on export and home account.

Latest prices are $4.00@4.75 for poor to fancy superfine State; $5.10@5.45 for common to fair extra do; $5.45@5.75 for good to choice do.; $4.25@5.00 for superfine Michigan, Indiana, Iowa, &c., outside for choice; $5.00@5.45 for shipping extra do., the inside price for poor, and $5.45@5.75 for good to strictly fancy extra do.; common to choice white wheat extras, $5.75@7.25; fancy do at $7.25@8.25; red and amber winter wheat, good to choice family, at $5.25@7.00; round hoop Ohio at $5.25@5.65, and trade brands of do. at $5.75@7.00, the latter for choice; St. Louis, $5.00@6.25 for poor to fair extra and $6.25@7.50 for good to fancy, (with a few brands of very fancy quality quoted up to $8.00@8.25); Minnesota clear, $5.00@6.50; Minnesota "straight," common to fancy, at $6.00@7.65, and patent poor to very choice, $6.75@9.00, with a few fancy at $9.25@9.75; unsound stock at $2.50@6.25; city mill extra at $6 10@6.35 for fair to very choice for West Indies; do. for England $5.25@5.35; do. trade and family extras, $6.65@7.75; do. South America, $6.50@7.50; No. 2 at $2.50@4.00.

Buckwheat Flour—Quoted at $2@2.50. Corn meal is selling at $2.60@3 for Western yellow and $3.20 for Brandywine.

FRESH FRUITS.—Apples have dwindled to a very small stock of really prime, and prices are very firm. Shipments are restricted by the high prices—only 800 barrels taken for the week.

We quote Baldwins, $4.50; Greenings, are firm at $3.75@4.25. Russets, selected sorts, $3@4; fancy small lots, $1.50; fair to good, $2.50@3; stock that would have to be repacked, $2@2.25; few lots reported in the interior. Cranberries are firm—supply in few hands. Fancy bls., $6.75@7.50; crate, choice, $2.25; good, $1.75@2; fair, $1@1.50—offerings nearly all of New Jersey. Grapes have only a special quotation—6@7c. for Catawba. Florida oranges are turning out well—$3@5 ₩ box; some beautiful natural show fruit, picked with stems and leaves. Peanuts are easier, late receipts going on the market. Picked, $1.00; $1.30@1.40 for Virginia. Hickory nuts selling better; Texas pecans, 8@10c.

FURS AND SKINS.—At Leipzig the market was neglected. London sales showed a decline 25 per cent in market, 10@20c. in beaver; 10c. in opossum below the low rates of August last. Home rates unchanged.

	No. 1 quality. Nor. & East.		West & N.W.	
Otter, ₩ piece	$3 00@	4 00	$2 00@	2 50
Gray Fox	40@	45	40@	45

Mink, dark	85@	90	50@	60
pale	50@	60	30@	40
Muskrat, winter	8@	10	6@	8
full	6@	7	4@	5
Kitts	@	2	@	2
Beaver, ₩ ₩	1 00@	1 25	60@	75
Raccoon	35@	45	35@	45
Opossum	3@	6	3@	6
Skunk, black			40@	45
striped			5@	20
Wolf, mountain			1 50@	2 00
prairie			50@	60

GRAIN.—All articles have been fluctuating as the news from the other side came Pacific or otherwise in regard to the eastern questions; at the close there is a weak feeling.

Latest sales are of No. 2 red at $1 57@—ungraded red and amber State, $1 10@1 37; white, $1 41; No 1 Northwest spring, $1 52; No. 3 Chicago, $1 26½; No. 2 red for January at $1 25; No. 2 Milwaukee spring, $1 36. Rye is a trifle steadier; sales of Western at 73@7 c.; State at 70@73c. Barley, 86c for No. 1 Canada; 80@86c. for six-rowed State. Corn is weak and quiet. Latest sales are of New York No. 2 at 59¾@60c.; steamer mixed, February, 56@56½c. Oats of New York extra white, at 41c.; do. No. 1, February, 37c.; No. 2 white, 36@36½c.; mixed Western, 37@38½c.; white Western, 37@39½c.

HAY AND STRAW.—Supplies and home demand continue fair, and prices are firm.

Bale hay, 65@70c. for shipping, and 75@85c. for retail qualities; clover, 40@50c. for prime. Straw, 50@55c. for long rye; 40@45c. for short rye, and 40@45c. for oat.

Exports last week, 1,109 bales; since Jan. 1, 1,585.

HIGHWINES are lower—$1.09.

HONEY.—Continues dull. White clover, 2-comb boxes, has sold at 14c., and good dark at 9c.

HOPS.—The English advices have been less favorable, and there is diminished business here, with prices, however, unchanged,

HIDES.—Exports for the week have been 2,358 bales. Prices remain unchanged, notwithstanding the stronger country advices.

State choice to fancy, 11@13c.; good to prime, 8@10c.; do., low and fair, 5@7c.; Eastern, new, 5@8c.; Wisconsin, do. 5@8c.; Yearlings, 3@5c.; Olds, all growths, 2@3c.; Californians, 12@14c.

LEATHER.—Hemlock sole, 21@22c. for light, 22@23c. for middle, 22@23c. for heavy, 20@21c. for good damaged.

OIL-CAKE.—Western is lower at $30@31 ₩ ton.

POULTRY AND GAME.—Live poultry is still low; sales to regular buyers still limited thorough causes noted last week.

N. J. chickens, 7@10c.; fowls, 10@12c.; Turkeys, 9@10c.; Trios, 6@7c.; Ducks, N. J., pair, 55@$1; Geese, N. J., $1.50@1.62; Western, $1.00@1.25.

Dressed poultry during the past day or two has had an improved demand but prices are still in an unsatisfactory scale for both seller and producer. There was quite a surplus of old early in the week but holders pushed it out as fast as they could at almost any price to peddlers and the cheap buyers. It is thought that fresh stock will have a better future. This will very probably be the case with near point raised, but when the West has to depend upon freight instead of express transportation, as it has this season owing to low rates here, much will depend upon the weather for the success of far western shipments.

Fancy Phila. and N. J. turkeys, 12@13c.; good, 8@11c.; large or Toms, 6@7c.; chickens, choice, 13c.; good, 9@11c.; common, 6@8c.; ducks, choice, 12@13c.; other, 9@11c.; geese, fancy, 11c.; other, 6@9c. Capons large 15@20c.; small and slips, 15@16c.

Game is as fully represented as the demand requires. Quail steady for choice. Inferior birds of any kind are not saleable. Ohio wild pigeons are of better quality than Missouri the latter have an acorn-fed bitterishness of flavor,

Hares and rabbits, pair, 30@35c. Canvas-back ducks, $1.00@1.25; Red-heads, 75c.; Mallard, 65@75c.; Teal, 30@40c.; Quail, prime, $1.50@1.75; soft, $1.00@1.25. Partridges, pair, 75c.@$1.50. Grouse, 70c.@$1.00.

PROVISIONS.—Hog products closed weak and fairly active. Mess pork $12.00@12.00 for spot lots $12.00 for January, $11 90 for February and $11.95 for March. Bacon at 6@—c. for long clear and 6¼c. for short clear. Lard—Western steam at 7-7c. for spot, 7-77c. for January, 7-87½c. for February, 7.97½c. for March. Tallow, 7 11-16c. for prime. Stearine, 8c. for prime Western. Beef hams at $16.50. Beef—New extra mess, $13@13.50; plain, $11@12.50; new pocket, $14.50; family mess, $16@17; extra India mess, $27@28.00 for city brands; do. Philadelphia, $23 50@24.

SALT.—Ashton's at $2.50; Higgins', $2.50 and other sack lots at $1.10@1.15.

SEED.—Clover, 8¼@8¾c. for prime: timothy, $1.37½@1.42½. Rough flax, $1.55.

VEGETABLES.—Exports of potatoes past week, 7,972 bbls.; since Jan. 1, 22,853; last year to date, 18,705. With a reopened supply demand, partly for Southern seed, the market for potatoes is more unhouled, and prices are firmer than for some time past. Sweets are nominal. Onions pretty firm. Florida green peas have sold at $7 ₩ crate.

We quote Peach Blows, $1.75@2, bulk and double-heads, Early Rose, $1.75@1.87; Peerless, $1.25@1.50; Nova Scotia, $1.50@1.75; Sweet, $1.50@2.50. Cabbages, 100, $2.50@4.50; red, 5@6. Marrow squash, bbl., $1.50@2; Hubbard do., $2.00@2.50. Russia turnips, 75@87c. Carrots, 75@87c. Beets, bbl., 75c.@$1.00. Red and yellow onions, $1.25@1.50; white, $1.25@1.75. Celery, doz., 75c.@$1.

WOOL.—There has been a very slow market, but prices are not changed, and generally holders are confident.

Latest sales are of X Ohio fleeces at 44c.; X and XX at 43@46c.; low Wisconsin, 41c.; Ohio combing, 54@58c.; Georgia, 30c.; Utah, 20c.; fall California, 16½@26c.

LIVE STOCK MARKETS.

NEW YORK, Jan. 23, 1878.

BEEVES.—The market eased up a shade in prices on Monday last, but has run rather steady ever since, cattle showing no important fluctuation. Very extra quality steers have brought satisfactory prices; a few fancy may be quoted 11½c. Choice, as a general rule, however, were covered by 10¾@11c. The range is under, this week, owing to the mixed condition of the later droves. A good many natives were in market—scrawny, rough, and poor enough to have made thin Texan choice, had they been here. Michigan and Missouri steers, 7½@8c.; fair to prime stock in lots, 8¾@10½c.; very common, 7c. Fat steers were reserved for the English market at 9¾@10¼c.

COWS AND CALVES.—Few wanted, and it is hardly worth while to send extras here. Hardly a fifth of the receipts find buyers. The nominal range is $40@70 for common to choice.

VEAL CALVES.—There is a fair demand for prime live; in fact, they bring more than dead stock; good to best, 6¾@8¾c.; common, 5@6c. Grassers don't pay at 2¾@5½c. Hog-dressed veal, at West Washington Market, 9@11c., and somewhat stronger.

SHEEP AND LAMBS.—Shippers have lost money for the past fortnight, as the demand cannot be regarded as an encouraging one. Stock has sold at 6¾c. for prime State lambs. Sheep, 4½@6c., including very good at 4¾@5¾c. A car-load of fancy Kentucky wethers, 161 lbs. average, brought 6¾c., will probably go to England. The price ought to make buyers here for such elegant quality.

HOGS.—There have been no sales of live for the past two days; market now indicates firmness; light receipts expected. Last sales about 4½c. Dressed hogs—Western, 4¾c.; country pork, 5@6c. for heavy to light.

Cough that will not yield to ordinary remedies, may be thoroughly cured by Dr. Jayne's Expectorant, a most effective remedy for all Bronchial and Pulmonary Disorders.

Reading for the Young.

THE MYSTERIOUS DUSTMAN.

AT night when children's bed-time comes,
I've heard my granny tell,
An unseen dustman goes his round,
With ne'er a cart or bell;
And wheresoe'r that dustman goes,
In bright young eyes his dust he throws.

The children forthwith rub their eyes,
And strive to keep them open wide;
The younger ones grow peevish soon,
And hang about their mother's side;
She knows what all these symptoms mean,
And says: "I see the dustman's been."

Nurse comes: the children wish good-night:
But ere each rests within his bed.
"Why can't we see that dustman come?"
Inquires some little puzzled head.
"Because," says Nurse, with look so wise,
"The dust is thrown into your eyes."

[*Little Folks.*

PLAYING CARDS.

WHILE I do not in the main approve of playing cards because of the pernicious uses to which they may be put, yet on the other hand, properly used, they are sources of innocent amusemet. That cards are intrinsically useful as a means of amusement is evidenced by the manner in which they have maintained their hold on people from remote antiquity. It may be interesting and instructive to tell you something about their history.

The origin of playing-cards, like the origin of most other things, is involved in considerable obscurity. One learned doctor maintains with much tenacity that seven hundred years before the Christian era they were known to the Egyptians—a nation which, like the Chinese, is generally adduced, though with doubtful results, to show us that there is nothing new under the sun. Another authority tells us that they formed one of the amusements of the Lydians during a great scarcity of corn which pervaded their country, when, according to Herodotus, they invented various games, "playing a whole day that they might not be in want of food, and on the next eating and abstaining from play." The famine

Fig. 1.

Fig. 2

lasted for eighteen years, and it is certainly possible that during this period the Lydians may have invented cards amongst their other sources of diversion.

But to descend from the region of speculation, the best authorities seem to be agreed that cards were known in the fourteenth century; and if the ultimate test of the truth of an opinion be the number of its advocates, we may safely follow the popular assertion that they were invented to amuse the madness of CHARLES the Sixth, the Well-Beloved of France.

In the French figures, from which ours seem to have been derived—though the names of the spades have come to us through the Spanish—curious men have discovered an esoteric signification. The hearts, "cœurs," or "gens de chœur," seem to them to denote the choirmen or ecclesiastics. Spades, the French "piques," of which, as before mentioned, we have borrowed the figure but not the name, were the military class. Clubs are the French "trefles," trefoil, or clover grass—the figure being taken from the French, the meaning from the Spanish. These represented the laboring class, or agriculturists. Diamonds are the French "carreaux;" the figure is again taken from the French, and it would appear the primary meaning also, which is that of a square, or rather rhomboidal figure. These represent the "bourgeoisie," or citizens, whose dwellings were generally at that time "carrelees," or inlaid after the fashion of mosaic.

The kings are said, moreover, to represent, and in fact, in French cards, bear the names of the great heroes of the Jewish, Grecian, Roman and German dynasties—that is, David, Alexander, Cæsar, and Charlemagne. The queens are Rachel, Judith, Pallas, and Argine—the last name being supposed to be an anagram for "regina," the queen of the name of Argine being known. These in the transcendental system represent beauty, piety, wisdom and hereditary right. The knaves or "valets"—terms which in both languages have fallen from their high estate and original signification—were the companions of the kings. The two names, Hogier, Labire, were those, we are told, of famous knights of the period. Another reason for assigning a French derivation to our cards is the frequent "fleur de lis" which occurs in the garments of the so-called "court cards."

Thus we see that while our cards, in all cases, follow the French in figure only, our "hearts," and we may say "diamonds," follow the French in name; while our clubs and spades are nominally corrupted through the intervention of the Spanish.

German cards of the seventeenth century have these suits: "bells," "hearts" or "red," "green" or "leaves," and "acorns." They appear as fruit upon a tree, like a genealogical tree, having its roots sometimes in a flower-pot, sometimes in a gentleman's head or stomach. In some cases the device has a very curious appearance. The seven of acorns is represented by a tree bearing seven specimens of that fruit symmetrically arranged; on the left-hand side of the tree, appar-

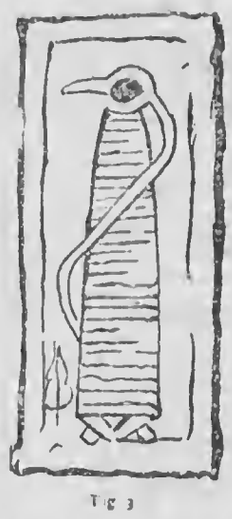

Fig 3

Fig 4

ently enjoying the acorn's shade, a shepherd is seated on a hilly ground shearing a sheep with an immense pair of shears; on the right is a portion of a residence, probably belonging to the shepherd, with three windows and an adjoining bush. The seven of bells shows, likewise, seven bells hanging upside down. The curious fruit arises from a flower-pot, containing, it would seem, a rose-tree, from a flower of that description being seen in the center.

The bells and acorns are not peculiar to German cards. They are also seen in the modern Portuguese cards; but they do not seem to exist in other nations. It is very difficult to establish any plausible connection between these names and those of the French, to which it is most probable they were anterior. The first certain notice of cards in England occurs in the time of Edward the Fourth. On the application of the card-makers, an Act was than made against the importation of playing-cards (A. D. 1463).

A few words on cards in China. They in common with everything else, appear to have been known very early in that enlightened "center of the universe." There is a tradition that they were devised for the amusement of the harem of Seun-ho, in 1120. Cards are called in Chinese "che-pae," which, being interpreted, means paper-tickets. Those most commonly used are called "tseen-wan che-pae," a thousand times ten thousand paper-tickets. Notwithstanding this name of legion, the pack only contains thirty cards—three suits of nine cards each, and three superior, or as we call them, court cards. The names of these cards are a "thousand times ten thousand," "the red flower," and "the white flower;" the suits are shells or money, cakes, and chains.

Figs. 1 and 2 represent the shells or money. Fig 3 is one of the suit of chains, and Fig. 4 is a court card. Fig. 5 is a fac-simile of the oldest card extant—a Queen of Hearts. Fig. 6 is the old German Three of Bells. The size of the Chinese cards is very nearly the same as that of the illustration given, exclusive of a narrow margin of white paper.

With respect to the first of the common names ace, deuce, and tray, much learning has been expended. The deuce and tray are the Latin cardinal numerals, two and three, coming through the French.

The invention of chess is generally allowed to have preceded that of cards. Pere Menestrier, a

Fig 5

Fig. 6

learned Jesuit, who has written voluminously on the subject, distinguishes them as the game of war and the game or peace. UNCLE TRUE.

LETTERS FROM BOYS AND GIRLS.

A Sly Puss.

DEAR MR. [EDITOR: I wrote to your paper a few weeks ago, and being very kindly received by the Cousins, I concluded that I would follow the old motto, and "try again." In one of your papers was a letter from Slayerofconceit, and he spoke in such a manner of all the girls in general, and a few that write to your valuable paper in particular, that he aroused my ire. But upon letting my anger cool, I happened to think of the good old maxim, that "Barking dogs are not apt to bite," so I do not feel very much afraid of him.

And now, dear Cousins, I am Puss by name, and Puss by nature, and it depends upon circumstances whether I am a scratching puss or not. But if Slayerofconceit happens to come around to the town where I live, I will then show whether I am a scratching Puss or not.

Before I close, I would like to remind him that "charity begins at home," and that I would try and be quite certain that I did not have any conceit before I went to rooting out that branch of evil from other people.—PUSSY CAT, *La Porte, Indiana.*

Not Satisfied.

DEAR RURAL: Hoping that I shall be accepted as one of the cousins, I now write to the RURAL. The last time I wrote, Uncle True got my letter, but I hope he will not get this one. I think that in the last RURAL there was quite a saucy cousin. She gave her name as Barney Blackstone.

I would like to know who likes the continued story by the name of Pauline? I am sure I don't. I agree with E. G., about Solomon Sap being impertinent. I will be thirteen a week from tomorrow. I can sew, and do some housework, but I don't intend to brag about myself and have all the cousins laughing at me. I think Slayerofconceit as bad as his name, I havn't seen one letter in favor of him. What do you say girls, do you not agree with me? I guess I have said enough, and I dare say B. B. thinks so too. Does any one know the verses of "Over The Hill to the Poor House!" If so, I would be obliged to any one who would send them to me through the columns of this highly prized paper. Please print this, and oblige—HIGHFLYER.

[The poem is Will Carlton's, and it will give me pleasure to print it for you, at some time in the near future,—U. T.]

Ecclesiastes; Or, The Preacher.

THE spring time is a beautiful season when the trees and fields are green, when the flowers are a-bloom, and all nature is radiant.

But what a change there is wrought within a few weeks. Bleak December days appear. The forests are sere and gloomy. The flowers are gone. So it is with man! In youth and middle age they are all activity. But in a few years what a change is wrought! The harvest comes, the work is ended, and where, oh were, is mortal man?

He has been carried to the dark and silent tomb, whence no weary traveler ever yet returned to bring the tidings thereof.—SABIN.

In His Fashion.

As is my fashion to do in other places, I step boldly in here, and speak a few words to you.

It appears to me that if it were not for piecing bed quilts, and cutting one another up, and fault-finding, a good many of the cousins names' I see every week in the RURAL would not appear there. But I like to read them very well, just to see who gets the worst of it.

And every week some new one steps in, to meet with a very different reception to what he expected. Perhaps I am not alone in my views. Perhaps you will not call me cousin.—CRITICISM.

The Puzzler.

MISCELLANEOUS ENIGMA.

I AM composed of 75 letters:

My 49, 15, 27, 2, 7, 19, 8, 33, 47, 16 unlawful.
My 5, 6, 58, 10, 46, 4, 3, 48 a musical arrangement.
My 31, 13, 21, 58, 43, 9, 4, 49, 12, 27, 49, 18 the time of the year when a plant puts forth its leaves.
My 36, 25, 24, 30, 29, 35, 40, 71, 32, 22 an owner of land in fee simple.
My 62, 75, 64, 11, 14, 39, 34, 55, 42 one addicted to adulation.
My 67, 1, 40, 75, 17, 8, 51, 4, 23, 61, 52 a military adventurer.
My 28, 38, 26, 37, 45, 63, 56 to that place.
My 44, 60, 70, 65, 6, 20, 72, 51, 53, 54, 49 pertaining to the healing art.
My 59, 57, 68, 69, 12 a tax.
My 73, 74, 50, 40, 19, 10, 3, 41, 27 transgression.
My whole is a text of Scripture.

ENIGMA.—Spring.

Sabbath Reading.

A MOTHER'S PRAYER.

S. A. C. D.

FATHER of Heaven, our strong Defence,
My children see;
Thou hast given them to me,
And taken their earthly father hence,
Keep them in Christ-like innocence,
And lift their hearts to Thee!

Dear Saviour, everlasting Son!
My only boy
Is on my heart a care and joy;
Teach him like Thee his race to run,
And for Thy glory, blessed One,
His talents to employ.

O Elder Brother; may Thy love
The sisters twain
Keep pure from every earthly stain!
Send down Thy Spirit, Heavenly Dove,
Truth, hope and joy in Thee to prove,
And in Thy grace maintain!

O Triune God, by faith confessed,
My children three
I long to consecrate to Thee,
That finally, Thy mercy blest
May bring them to Thy perfect rest,
Eternal Trinity!

GOD'S BOOK INFALLIBLE.

IT is impossible for God to lie (Tit. i. 2); therefore every statement made by God must of absolute necessity be infallibly true.

Upon the authority of the Lord Jesus, the Old Testament is inspired.

1. Jesus frequently mentions some of the writers by name. In Mark x. 3-8 He speaks of Moses; in Matt. xiii. 14, 15, of Esaias; in Mark xiii. 14 of Daniel; in Luke xx. 41, 42, of Daniel; and He also quotes others as furnishing the words of God. (See Matt. xii. 7, xxvi. 31; Mark xii. 26, 27.)

2. Jesus often asked His hearers, "Have ye not read?" (Matt. xix. 4) "What is written in the law? how readest thou?" (Luke x. 26) intimating had they searched the Scriptures they would have known the will of God.

3. Jesus divided the Old Testament into three parts, viz.—the law of Moses, the prophets, and the psalms (Luke xxiv. 44, 45). He opened the understanding of the disciples that they comprehend the Scripture; consequently the whole of the Old Testament must have been inspired by God, or it may have been supposed that they would have comprehended its meaning without supernatural aid. (See also I Pet. i. 10.)

4. Jesus asserts that He came to fulfill the law and the prophets (Matt. v. 17). If sinful man were the originator of the law and the prophecies, Jesus, who is perfectly holy (Acts iv. 27), would not have come to fulfill them; hence God inspired each and every prophecy.

5. Jesus resisted each temptation in the wilderness by quoting from the writings of Moses (Deut. viii. 3, vi. 13) and from the psalms (Ps. xci. 11, 12).

6. Jesus gave to the Scriptures an exalted position, as was His custom (Luke iv. 19); and He both heard read, and Himself did read, the word of God in the synagogue.

Now for a few general proofs.

"All Scripture is given by inspiration of God" (2 Tim. iii. 16); "when ye received the word of God which ye heard of us, ye received it not as the word of men, but as it is in truth the word of God" (1 Thess. ii. 13). See also 2 Pet. i. 21, 1 Cor. ii. 13, Rom. xvi. 26, Tit. i. 3.

Mention of individual writers who were inspired: Moses, Deut. xxxi. 19, 24, 26; Isaiah, Acts, xxviii. 25; Ezekiel, chap. i. 3; Jonah, 2 Kings xiv. 25; Haggai, chap. i. 13; Zechariah, Ezra v. 1; David, 2 Sam. xxiii. 2; Jeremiah, chap. i. 9; Amos, chap. vii. 8, 14, 15; Hosea, chap. i. 1, 2; Micah, Jer. xvi. 18; prophets generally, 1 Pet. i. 10, 12; all of St. Paul's epistles, 2 Pet. iii. 19; John, Rev. i. 1-3, 19.

The Bible is both complete and sufficient: "If they hear not Moses and the prophets, neither will they be persuaded though one rose from the dead" (Luke xvi. 31).

Names of the Bible. The Holy Scriptures (Rom. i. 2); God only is holy (Rev. xv. 4), therefore He is the Divine Author. The Book of the Lord (Isa. xxxiv. 16). The Scriptures of truth (Dan. x. 21). The word of God (Heb. iv. 12). The Scriptures (John v. 39).

The word of God is pure (Ps. xii. 6, cxix. 140; Prov. xxx. 5). God only is holy; therefore He must be the originator of pure words.

Nothing may be added to the word of God, nor taken therefrom (Rev. xxii 18, 19; Prov. xxx. 6; Deut. iv. 2. xii. 32); Jehoiakim, king of Judah, was punished for burning the roll (Jer. xxvi. 29-31). Let us be thankful that in our day we possess a complete and free Bible.

BASHAN.—SHEPARDS LEADING THEIR FLOCKS.

"As we sat and looked," writes the gifted author of "the Giant Cities of Bashan," "the silent hillsides around us were in a moment filled with life and sound. The shepherds led their flocks forth from the gates of the city. They were in full view; and we listened to them with no little interest. Thousands of sheep and goats were there, grouped in dense confused masses. The shepherds stood together until all came out. Then they separated; each shepherd taking a different path, and uttering, as he advanced, a shrill peculiar call. The sheep heard them. At first the masses swayed and moved, as if shaken by some internal convulsion; then points struck out in the direction taken by the shepherd; these became longer and longer until the confused masses were resolved into long living streams, flowing after their leaders. The sight was, perhaps one of the most vivid illustrations which human eyes could witness of that beautiful discourse of our Lord, recorded by John: "And the sheep hear the shepherd's voice; and he calleth his own sheep by name, and leadeth them out; and when he putteth forth his own sheep he goeth before them; and the sheep follow him; for they know his voice. And a stranger will they not follow; for they know not the voice of strangers' (John x. 3-5)."

PERSONAL ITEMS.

Ex-Secretary Bristow has little round eyes.

Mr. Whitelaw Reid is a bachelor of forty-two.

Mr. Gladstone on the 29th ultimo completed the sixty-eighth year of his age. Lord Beaconsfield is seventy-two.

Mr. A. H. Stephens breakfasts at half-past five in the morning, it is said: he never eats butter, and he especially likes broiled chicken.

Senator Blaine slightly lisps when he is deliberately speaking, but when he is as mad as a hornet he speaks strongly he stretches out his arm as is if he were holding a weight on it.

Colonel Robert G. Ingersoll, the leading infidel, is a stout body with boyish features. He has pouting lips, a round face and soft, straight, brown hair. Altogether he has the appearance of a twenty-year old cherub, in a fifty-year old vest.

Dr. Schliemann, the discoverer of ancient remains, before leaving Athens for London, exposed himself to the risk of serious illness by excessive labor in packing the treasures now on exhibition at the South Kensington Museum, and has become almost deaf in consequence.

Some years ago, in speaking her mind to Chief Justice Chase, Mrs. Gaines told him that she should battle before the bar until she was 150 years old. "And to think, madam, that this is to be kept up for 125 years longer!" said the Chief Justice, and bowed to the active widow.

The King of Italy died just five years to a day after the death of Louis Napoleon. The Buffalo Express remarks with ill-suppressed levity that "The death of Victor Emmanuel takes from the world, among other things, the most ferocious and generally remarkable moustache it ever had."

Mr. George Bancroft, the historian, though in his 78th year, is a tireless worker. He is now in Washington gathering materials for the forthcoming volumes of his history. In person he is spare, with bushy white hair and a long, full white beard. Every afternoon in good weather he rides horseback for an hour, attended by a groom.

Lieutenant Bullis, the dashing cavalry officer, famous for his Mexican raids, is only thirty years of age, has already served on the Texan frontier for eleven years, and is now in command of an effective company of Seminole scouts. He has black hair and moustache, and is about five feet eight inches in hight, and a model of physical strength and endurance.

PARTICULARLY
FOR THE LADIES!

THE RURAL NEW-YORKER, at the instance of Miss FAITH RIPLEY, conductor of the Department "For Women," offers, as one of the most valuable and acceptable Premiums of the season, a Steel-Plate Engraving, size 24x32.

The subject,

"OUGHT AND CARRY ONE,"

portrays a pretty young girl, gracefully poised, and holding pressed against her side, a slate on which she is "doing sums." The contracted brow, puzzled expression and drawn corners of the mouth, express most comical dismay.

This charming picture is printed from a new plate, the lights and shadows are clearly defined, and this work of art, when nicely framed, is a decided ornament.

Nothing is more refining and elevating than *good* works of art, and we confidently proffer this as something greatly in advance of anything heretofore announced.

We anticipate that this offer will appeal especially to our lady readers, and in order that the picture may be placed within the reach of all, we have scaled the club so low that it partakes more of the nature of a gift than a premium.

5 SUBSCRIBERS AT $2 EACH,

will entitle any one to the Engraving.

For specimen copies and outfit for canvassing, address

RURAL NEW-YORKER,
78 Duane St., New York.

New Publications.

"A brilliant work, that will be widely read and generally praised."
[Saturday Gazette.

The Nabob.

From the French of Alphonse Daudet.

[From the Nation.]

"There is a very humane vein in his talent, and he shows us here and there a charming oasis of simplicity and purity in the chapter called "La Famille Joyeuse.'"

"There are many happy and charming details in this 'Nabob.'"

[From the New York Graphic.]

"Daudet's genius always reminds me of that of Hawthorne; he is, indeed, a FRENCH HAWTHORNE."

[From the Portland Argus.]

"The book is indescribable, and must be seen to be appreciated. It is a work of intense interest."

[From the Chicago Tribune.]

"'The Nabob' is remarkable, and will hold, if I am not greatly mistaken, a supremacy surpassing that of 'Sidonie.' The book is a study worth far more than 'Sidonie' and 'Jack,' and will give the name of Alphonse Daudet a fame he had not before achieved."

THE COBWEB SERIES OF FICTION

Vol. I., SIDONIE, by ALPHONSE DAUDET.
" II., FIRST LOVE IS BEST, by GAIL HAMILTON.
" III., VINETA, by E. WERNER.
" IV., JACK, by ALPHONSE DAUDET.
" V., FORBIDDEN FRUIT, by F. W. HACKLANDER.
" VI., THE NABOB, by ALPHONSE DAUDET.

Each volume 12mo., cloth, $1,50.

*** For sale by all Booksellers, and sent, post-paid on receipt of the price by the publishers.

WHITE GRAPES,

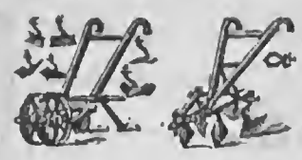
&c., &c.

I have the best White Grapes in the United States, the result of 20 years in growing seedlings. I also offer for sale "Miner's Great Prolific" and the Great American Strawberry plants; berries nine inches in circumference, the most productive ever known, and at half the prices of 1877. Also, "Miner's Hybrid" melon seed, never equaled in quality, with other choice fruits. Prices of all very low, as I do not grow fine fruits so much for profit as for pleasure. To Agents who introduce my new fruits among their friends, I send a supply free! My Circular, with full details, is now ready, and is sent free to all applicants. T. B. MINER, (Ex-Editor of the Rural American,) Linden, Union Co., N. Jersey.

Implements and Machinery.

THE PATENT NAPKIN HOLDER,

Since its introduction, has met with an enthusiastic reception, and seems to meet a want long felt by every one. The parents buy it for their children, while gentlemen and ladies all over the country write, as soon as they receive and use the sample, that they "are so much pleased with it, they want more for themselves and friends." It holds a napkin or bib in place, so that the clothing is entirely protected. They are made of the first quality of nickel silver, heavily plated with pure silver, and are connected with a heavy silk cord. They are also used very successfully as a skirt supporter, fastening on anywhere, and without injury to the most delicate fabric. The cut is shown one-half size, while that of the boy illustrates the method of use. Price per dozen, $3.00 by mail, postage paid; or a sample one will be sent on receipt of 25 cents. SPECIAL TERMS TO LIVE AGENTS, LADIES OR GENTLEMEN. Manufactured only by
THE NEW ENGLAND PLATE COMPANY, New Haven, Conn.



Allen's Planet Jr. Hand Seed Drills and Wheel Hoes are *standard* machines: thousands in use: have taken the *Centennial, Franklin Institute Silver, Erfurt, Germany,* and other medals. Wit and Humor.

SPARKS AND SPLINTERS.

"That Banker of Mine" has the best run of anything out. The edition rarely stops short of Europe.

If the short man ever feels overcome with an intense desire to be tall, it is when he finds himself on the outside of a crowd at a dog fight.

Some one will soon bring out a volume and put a stop to these silly book titles. It will be entitled: "The Fool, or the Man who Buys Me."

"That's a bit up-hill for me," as the cripple on crutches said, when he came to a place where the road sloped upward at an angle of forty-five.

It is not difficult to imitate Josh Billings; thus: "Doan't karray aigs in your cotale pocket. Aigs ain't good after they've been sot on awhile."

He was bound to be accurate, and he thus described the woman's costume: "She wore a suit of something or other, cut bias and trimmed endwise.

The old maxim, "be chaste and you'll be happy" is contradicted point blank by a Black Hills man, who was recently chased ten miles by a party of red-skins.

The horse-shoe done in flowers seems to be supplanting the time-honored floral bell at weddings. Is this to make horse-shoe-rance doubly sure in tying the knot?

Lady to door-keeper of the French Assembly—"Here is a franc for you. Just see that the session is entertaining. I will give ten sous more if they come to blows!"

The Worcester Press man shudders to think of the time when a woman's dress will consist of shred black silk which she will carry in her hand, at a distance from and behind her.

X. is a fine conversationalist. "Remark," said he, the other day, "what is, on this point, my style of thinking." "Ah!" said a bystander, "tell me your thought, but save me from your *style*."

A countryman at the baby-show asked: "Ladies and gentlemen, why is a—when is a flowerist like a wise child?" "I think, perhaps," said a timid maiden lady, "it's when he goes to bed early."

Now does the foolish man devour the cold mince pie before going to bed, and before another sun appears is surprised to see green turkeys, clothed in yellow blouses, hitched to a red omnibus.

A would-be-suicide wrote these farewell words to his wife: "Dear Mary, when my body is dragged out of the river they can identify it by the linen patch you put in the seat of my black cloth trowsers."

First fond Parisian mother of an actress—"Well, how is your little girl coming along?" Second of ditto of ditto—"Oh, nicely. She never stops now before a shop window where the jewelry is paste."

Clerical hint:—It is a bad plan to divide a sermon into too many heads, for this reason, that there may be considerable difficulty on the part of the congregation in finding ears for all of them.—*Judy*.

We hear, remarks an exchange, of second crops of everything this fall, on account of the warm weather, and now a second crop of old summer clothes has appeared on a good many persons in this place.

Cordial but equivocal. Mamma—"Look, Cissy, here is the doctor coming. What a favorite he is! See, even the little chickens run to meet him," Cissy—"Yes, ma; and the little ducks cry 'quack, quack!'"

It is said that at dinner parties in Spain the oldest lady present is seated first. When that plan was tried in New York many years ago it resulted in the collations given at evening parties where everybody stands up.

Never send a woman to the postoffice with a letter. If she doesn't quarrel with the postmaster because she doesn't see it go right into the mail bag, she will forget to stamp it, read it, or else lose it before she gets to the office.

Slavey.—"Missis ses the milk's more than 'arf water, an' she'll have to deal sumwares else if 'tain't no better." Milkman.—"Well, my dear, you must tell your missis that I'm very sorry, but them cows of mine will eat damp grass, and I can't prewent 'em this weather."

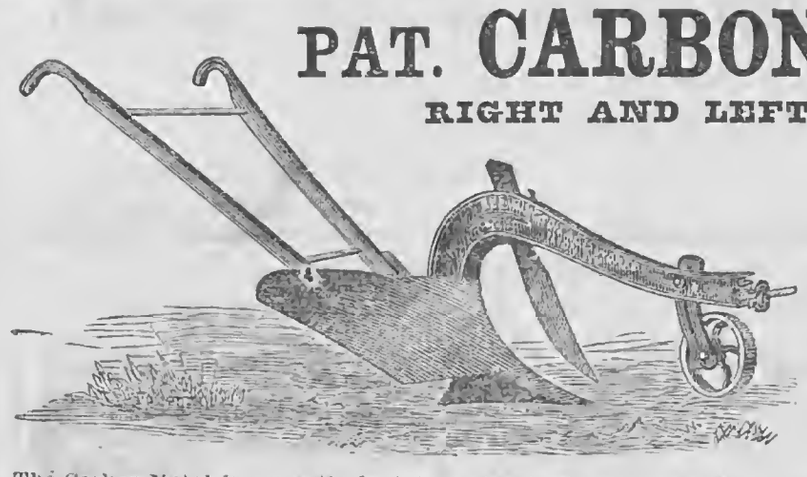
Early in the century a rich Englishman left his daughters their weight in one pound banknotes. The elder got fifty-one thousand two hundred pounds, the younger fifty-seven thousand thousand three hundred and forty-four pounds—the handsomest pair of paper weights on record.

OPENING THE CAMPAIGN.

Generalissima (otherwise Mamma.)—Girls! Attention! None of you having gone off—indeed, I may even say none of you having shown any signs of being likely to go off for some time to come—I do really think it very unkind and—very un—what do you call it? Un-daughterly of you, and I really do hope that you will—in fact it is really absolutely necessary that you *should*—do something *soon?*

PAT. CARBON PLOW.

RIGHT AND LEFT HAND.



THE HARDEST KNOWN SUBSTANCE THAT WILL SCOUR IN ANY SOIL.

The Carbon Metal is a practical mixture of refined steel, wrought iron and other metals, cast in form. *Harder than steel* or any surface-chilled iron. N. B.—Also manufacturers of the celebraced Remington Patent Steel Shovels, Scoops, Spades, Etc. Also, Right and Left-Hand Steel and Grey Iron Plows.

TO PUBLISHERS.

The Rural New-Yorker has accumulated a very large number of desirable Wood Cuts, Electrotypes, etc., representing illustrations that have appeared in this journal from time to time. We have had numberless inquiries from publishers, asking our terms for such cuts as were desirable to them; but we have never, until the present time, had them arranged in a manner that made them easy of access for reference.

We are now prepared to fill orders for these Cuts, and as we do not care to do more than secure a part of the first cost of the pictures (having used them once), we shall make the prices very low. Similar Cuts cannot be bought in New York for less than 20 cents per square inch, and from that price ranging up to 50 cents, according to the quality of the work.

We now offer any Illustration appearing in the Rural New-Yorker, at the following price, delivered in New York:

TEN CENTS PER SQUARE INCH.

All expenses of postage or expressage must be borne by the purchaser.

This rate is so low that we cannot undertake to furnish proofs of Cuts, or do anything that will cause extra expenditure of time, labor and postage on our part. Intending purchasers should indicate the Cuts and date of papers in which they appeared. On receipt of this information and the cost of the Cuts (where the parties are not known), we will immediately fill order.

Adams' Patent Self-Feeding Power Corn Shellers (widely known as the Sandwich Shellers), of sizes and capacities to suit all wants.

GREATLY IMPROVED THIS SEASON.

FARM HORSE POWERS of all sizes and most advantageous forms. HAND SHELLERS of highest grade of excellence in material and manufacture. Send for Illustrated Circulars.
J. P. ADAMS, Secretary.

Matthews' Garden Seed Drill,
Matthews' Hand Cultivator,
Matthews' Drill & Cultivator combined, surpass all others. Send for Circular before you buy.
Manufactured only by
EVERETT & SMALL,
Boston, Mass.

THE "BOSS"
Scroll Saw.
The Best and most Practical of its kind in use.
Simple, Cheap, Light Running and Durable.
With adjustable table for inlaying work, it is especially adapted for ladies' use.
Every machine fully warranted. Send stamp for Circulars and full particulars. Address the manufacturers,
LEWIS BROS.,
Seneca Falls, N. Y.

THE AMERICAN HAY ELEVATOR.

The most perfect, simple and ONLY Elevator that raises the hay from wagon and carries it in barn any required distance. Economical, durable, labor-saving. Send for Illustrated Circulars and prices to
J. R. FITZHUGH,
1708 Barker St., Philadelphia, Pa.
Branch Office: 55 Beekman St., New York.

SEEDS.

All the leading and most desirable kinds of
VEGETABLE, FIELD,
AND
FLOWER SEEDS,
will be found in my new price lists. Mailed free to all.
ALFRED BRIDGEMAN,
Broadway, cor. 18th St., New York.

J. M. THORBURN & CO'S
SEED WAREHOUSE
15 JOHN ST., NEW-YORK.
NEW DEPARTURE.
At the solicitation of many of our friends, we this season publish our Catalogue of Vegetable, Agricultural, Flower and Tree Seeds, together with all the Novelties of the Season, under one Cover, free to all on application by mail.
SEEDS BULBS, SEEDS.

CHEESE VATS.
We continue to manufacture Steam Boilers and Engines and all kinds of Cheese and Butter-making Apparatus, combining the latest improvements. Send for Illustrated Circular and Price List.
CHARLES MILLAR & SON, Utica, N. Y.

IMPORTANT TO FARMERS.
A patent that will enable any one to produce new potatoes, ripe fruit, &c., all through the winter, nearly as cheap as in their ordinary season, will be given to "responsible" farmers for one-fourth of the proceeds for seven years, and afterward free. Address, with two stamps to pay return postage.
J. CLARK, P. O. Box 1571, New York.

25 Cards, 25 styles, 10c., or 20 Chromo Cards, 20c., with name. J. B. HUSTED, Nassau, N. Y.

25 FASHIONABLE CARDS, no 2 alike, with name, 10c., post-paid. GEO. I. REED & CO., Nassau, N. Y.

50 Best Mixed Cards, with name, in case, 13c., or 25 no 2 alike 10c. Outfit 10c. Dowd & Co., Bristol, Ct

TEAS REDUCED
OUR TERMS ARE THE BEST.
Send for our New Reduced Price List.
THE GREAT AMERICAN TEA COMPANY,
P. O. Box 5643. 31 and 33 Vesey St., New York.

TEAS This is a combination of capitalists to supply *consumers only* throughout the *United States* with PURE TEAS on the mutual principle, by getting up clubs. Send for New Price-List.
CONSUMERS' IMPORTING TEA CO.,
P.O. Box 5509. No. 8 Church St., New York City.

SUFFERERS from NERVOUS DEBILITY etc., can learn of a certain and speedy remedy, *free*. Address DR. JAQUES & CO., 130 W. 6th St., Cincinnati, Ohio.

GUNS and Revolvers. Illustrated Price List free. *Great Western Gun Works*, Pittsburg, Pa.

CIDER PRESSES AND GRATERS.

OUR PLANT-PORTRAITS.

THE NORWAY SPRUCE AND ITS VARIETY, ELATA.

The Norway Spruce is one of the most popular, if not one of the most beautiful and hardy of evergreens. If it were properly treated while young, we are convinced it would command a higher respect during its old age. The desire on the part of those who plant trees about their homes, to see them grow as fast as possible, and their distrust of any pinching or cutting back, are natural. Anything that retards growth for one year is condemned. It is too long to wait for results that at best are not to be counted upon positively, as they believe. Therein lies the mistake. The results may be confidently counted upon; and in this we speak from our own experience.

The Norway Spruce, if left to itself while young, and especially if not well planted, attains its fullest beauty in ten years. Afterwards, the lower branches begin to lose their foliage, and the conical symmetry which in this tree constitutes its first charm, is marred. If when first set in its permanent abode, the buds had at once been pinched out or, what is the same thing, the tips of all the branches except the lower and lowermost ones had been cut off, and the same course had been pursued the second spring, growth would have been confined mainly to the lower branches, and a vigor would have been imparted to them that would be retained as long as the upper branches remained robust, or as long as the tree maintained a healthy existence.

The impression which until of late years has been quite general, that evergreen (hardy coniferous evergreens, at least) were never to be cut back, is still a conviction in the minds of many. And it is one that deprives them of the very best means both of adding to the attractiveness of their evergreens and of preserving that attraction unimpaired to a good old age.

For the purpose of inducing this strong development of the bottom branches, and at the same time a more compact habit throughout, instead of cutting off or "back" the branches, we have, for several years past, merely twisted out the verticel of buds which terminates them. These buds begin to form as soon as the spring growth is completed, and they may be removed in the following fall, winter, or early the next spring. Thus only the terminal growth which would have been made is prevented, and the same object is accomplished without diminishing the proportions of the tree.

Our illustration from life, is that of a variety of the Norway Spruce called Elata (Abies excelsa elata). The variety known as Monstrosa is notable chiefly for its long, straggling branches with few laterals. It is, indeed, of all evergreens the most lawless, if we may so speak. It despises symmetry, and seems to delight in destroying any semblance of equilibrium.

The variety which we illustrate preserves much of the long, spreading, thickened disposition of the branches of the other, while with a little direction by pinching out the buds as we have stated, a tree of marked and pleasing character, airy, free, commanding, is obtained. It is as hardy as the species, and will please all who seek variety among their evergreen collections.

To the average planter, variety among evergreens is not studied as it is among deciduous trees. It is a great pity that it is so, and we ask our friends who propose to select this spring, to visit nurseries and examine the extremely varied forms and foliage which the evergreen family presents.

ABIES EXCELSA ELATA.

THE PYRAMIDAL OAK.

SAMUEL PARSONS.

All trees have positions on the lawn specially suiting their peculiar qualities. There are trees of grace, trees of massive grandeur, and trees of diminutive size and exquisite charms. All will, if allowed, produce perfect effects, each after its kind. It is for this reason we feel a slight sense of wrong done whenever any variety is declared the best without exception or qualification. Some there are, of course, that have defects which unquestionably limit their usefulness, but a very large number may be counted on to perform their proper work most admirably. Charity should exert itself to condone the faults, even of trees, for the sake of their good qualities, especially when we know that the bad ones may be improved or veiled by pruning and other methods. Even Silver Maples and Norway Spruces, so generally popular, we can accept gladly, despite all our prejudice against them. They are attractive during particular stages of their growth, and may be cut down after reaching the ugly period, when indeed their use as screens to other plants ceases, because the age of such plants has usually by this time rendered them quite enduring.

Desiring to express the most catholic views concerning the graces and peculiar fitness of most trees in one way or another, we must yet acknowledge a fondness for certain rugged, enduring species. Not that they are necessarily any finer in their prime than shorter-lived plants, but they have been with us so long; there is such a sense of permanence and long continued relation. In our childhood they were with us, and in our maturity they still retain that perfect vigor and completeness that preserve so entirely their identity with their remembered forms of years ago. Associations cling about them, and we seem to know them better than their more recent companions.

Chief among these trees of peculiar vigor and longevity are the oaks, and were it not for their slow growth (which produces, however, their real strength and attraction) we doubt not that our lawns and avenues would be more often graced by their presence. We have been too much in a hurry, most of us, but patience will come as the country grows older, when oaks will attain, in public estimation, their proper dignity as shade trees. There are some oaks, however, that receive an unusually small modicum of attention, and on one of these, the Pyramidal Oak, we should like to dwell a few moments. It is a slow growing, massive tree with rich, green foliage hanging on its compact, thick-set boughs until late in fall. The bark is smooth for an oak, and dark, and the leaves cut much after the fashion of those of an English Oak, its proper type in very many ways. It grafts readily on the English Oak, and has all its good qualities. But the special attraction the Pyramidal Oak must always offer to the landscape gardener is its peculiar compactness and lack of spread in the branches. The outline would be truly remarkable any where, although the term pyramidal is perhaps a misnomer, for the contour swells so regularly from a minimum at the base to a maximum about half way to the crown, then diminishing to a distinct point at the summit, that it becomes more properly an ovoid than a pyramid.

It must, at once, appear that such a decided and striking form, always uncommon among deciduous trees, can be utilized with great effect upon the lawn. Heretofore it has failed to secure the attention which its elegance of outline and other good qualities merit. We should like much to see it more extensively employed in landscape design, for its nature is sterling and of lasting value.

[We have had this oak for three years. It makes yearly a growth of not less than four feet, and assumes the outline which Mr. Parsons' describes. But every spring we find most of the last season's growth winter-killed, and two years ago the stock of one was severely injured. Whether it becomes hardier as it grows, older, or whether this injury is due to peculiarities of our soil, we cannot say.—Eds.]

CELASTRUS SCANDENS.

This is a vine too much neglected. The Bittersweet is fresher in the memory of "the oldest inhabitant" than it is in that of the amateur gardener of to-day. In the rush for new things, it sometimes happens that the best of the old are forgotten for years. Then it is revived, and not unfrequently under a new name, is re-introduced, creating as much interest as if it had never been "old." It so twines itself about the branches if planted near the trunk of some old tree, as in a few years to appear a part of the tree

Farm Topics.

AGRICULTURE AND EDUCATION IN THE UNITED STATES.

PROF. I. P. ROBERTS.

No. 4.

In former articles, statements as exact as it is possible to make, have been given, as to the provisions that have been made for carrying ont in good faith, the conditions of the grant of 1862, and as to the work that has been accomplished. The question follows; What has been and will be the effect on those two leading industries?

The time is too short since these graduates have entered upon active duties, to enable us to form any very accurate or positive conclusions. We only know that with scarce an exception, they are found occupying respectable positions, and quite frequently those of honor and trust. From the best information attainable, I find about one half of those who have studied Agriculture, either return to the farm or engage in some pursuit connected directly with it. This is about the same proportion as we find in other callings; only about half the number who have received special or technical instruction, enter and continue in the callings for which they prepared

The young doctor fails for want of patients, the lawyer for want of clients, and the young farmer, for the very good and sufficient reason, want of a farm. Many of the graduates, to my certain knowledge, have not at the end of their course, a single dollar: even worse than that, some are actually in debt two, three, or four hundred dollars.

The question is not so much: What would I like to do? or even: What will pay best? but: What can I *get* to do by which I can secure a living and pay my debts? Circumstances may cause many of these to drift far away from their original plans and likings; but I predict that in most cases with the first opportunity they will embrace their "first love" with all their youthful ardor, tempered and directed by age and experience. While those who have received instruction at these schools, have frequently benefited the industries in their immediate locality, yet for want of time, if for no other reason, their influence could not well be extended or marked.

On the other hand, the influence exerted by the various teachers connected with these schools devoted largely to the interests of the industrial classes, has been marked and beneficial. By their writings, researches and experiments, by their frequent papers and addresses at farmers' institutes, clubs and conventions, they have been enabled to reach nearly all who earnestly desire to advance; and the result of their labors has been to benefit the industrial classes and the industries beyond expectation. The establishing of these colleges called forth a vast amount of thought, discussion and criticism, which has not been without its beneficial results. There are those who still fear the old empty cans of dynamite labeled "Book-farming," "Co-education," "Unsectarianism," but all that is left of this dangerous substance is the label which is getting old and dim, and the nervous strain will soon be relieved as it fades entirely from sight.

There have been several causes that have prevented these institutions from accomplishing greater results. The chief of these may be stated under four heads, viz: (1) want of funds, (2) want of trained teachers in the department of practical agriculture, (3) want of a full knowledge as to methods, (4) prejudice.

Several of the States realized less than $150 000 for their lands; the yearly income from which would build a good barn, or possibly purchase a Duke Bull. Few people have any conception of the actual cost of a common school education; they have never stopped to consider or reckon it, and fewer appear to realize the cost of establishing and maintaining a well equipped college. They do sometimes get an inkling of the cost of a thorough education when they think of sending a child to college, by computing as accurately as possible the cost of board, rent, tuition, books and traveling expenses; and when they find that it foots up from one to three thousand dollars, they are surprised to say the least, and very erroneously conclude that the benefits to be derived will not justify the outlay. None of the larger and few of the smaller colleges, think of charging for tuition more than a fraction of the actual cost of it, and some do not charge anything. If they were not heavily endowed, the industrial classes and those of limited means would virtually be excluded from a college education. Endowments to educational institutions benefit not the wealthy so much as the common people. This being the case, what better disposition could we make of our public lands, than to make an equitable distribution of them for educational purposes?

TEACHERS.

At first, great difficulty was experienced in procuring suitable teachers, for their qualifications must be peculiar, and to some extent unlike all others.

Their education must also be very extended, for in these half-endowed colleges, one Professor was expected to fill two or three chairs. In addition to this, it was desirable that he should bring to his aid, business and financial ability, equal to that found among men whose whole lives have been spent in learning how to acquire wealth. Here, in these colleges, created as by magic, was to be the ideal paradise where the highest education, science and practice, were to dwell together with no family jars or differences, notwithstanding their very recent introduction and short acquaintance. It appears hard to find men, even now, that by the most scientific process of flattening and stretching can be made to cover two or three chairs, and have room enough left for the farm under one wing and the live-stock under the other.

METHODS.

The method to be used in reaching the desired results was hardly as yet conceived; much less digested and arranged. Time, necessarily, has been lost in learning the best systems of conducting the new enterprise; where all was formerly problematical and untried, now in a great degree well-defined and tried methods are found, which have, in many cases, proved successful beyond the most sanguine hopes.

The finances of the farm have been a great stumbling-stone; for it was argued, "If the farm won't pay, the whole thing is a failure." The result has been that, in too many cases, it has been run simply to make dollars and not for the purposes for which it was designed, namely; illustration and instruction to the student. While fields of corn or wheat should be cultivated with a view to the best results, it should not be done for the dollars, but for the purpose of instructing the students as to the manner in which the result was reached.

The amount of manual labor required to be performed by the student during his college course, has been discussed and re-discussed without coming to any uniform conclusion. Michigan Agricultural College still holds on to its early practice of requiring work throughout the entire course; Iowa has modified the former practice, so that work is now only required in the first and second years; while Cornell, which formerly required little or no manual labor, now devotes two afternoons per week to field practice, or to visiting adjoining farms through the entire senior year; and also requires all students who have not been brought up on a farm or who, from any cause, are not familiar with ordinary farm work, to remain on the farm, and engage in farm labor for at least two months during the summer vacation. So we see that the manual labor question is not yet settled. The prevailing public opinion at first was that much practice and a moderate amount of class instruction should be given. Wherever this experiment has been tried, it has resulted in expert workmen rather than educated men.

On the other hand, some have advocated that familiarity with all the ordinary operations of the farm could be acquired more cheaply and rapidly at home, and that the time spent at college should be devoted to studying such subjects as related to their intended calling, a knowledge of which could not be so well acquired elsewhere; and that the field practice should only extend to the intricate and difficult operations and those whose special provisions would have to be made in order to fully comprehend the subjects taught. The subject of the relative amount of labor, recreation, and study during a college course is one that may be more fully discussed with profit. The limit of this article forbids giving my views here, but I may do so at some other time. Certain it is that four years is not enough time in which to become expert in all of the operations on the farm, (provided there has been no previous training,) and also to acquire a fair knowledge of the subjects laid down in the curriculum.

PREJUDICE,

Which has had much to do in preventing these colleges from accomplishing the greatest amount of good, has not been confined entirely to the industrial classes or the farming population. It has too frequently happened that the authorities in charge were men who had no sympathy for, or faith in what is sometimes called "The new education." They had been taught and fully believed that no true success could be attained, or thorough culture acquired, without a knowledge of Latin and Greek. On the other hand, many of those whom the new education was designed to benefit, still held on to the old idea, that ignorance was bliss in Agriculture. But opinions are changing; as we get more light from experience, we are more inclined to receive and give due credit to all classes of knowledge provided they train and develop the man, and fit him for greater usefulness and happiness.

The rural population of to-day, do not appear to be very particular about modes or systems, provided they can get at new facts and increase their fund of information. That there is a great and growing desire for information, cannot be denied, I think, by anyone who has carefully observed and noted the progress of events for the last twenty-five years.

This striving for something better and higher, has not only given rise to the colleges of which I have been speaking, but also to numerous and valuable societies and organizations, extending from the Atlantic to the Pacific and reaching every hamlet and homestead, benefiting directly or indirectly every tiller of the soil. Of the benefits of the press and of some of these organizations, I propose to speak in my next.

Cornell University.

RURAL TOPICS.

T. B. MINER.

SALT AS A FERTILIZER.

There has never been an established value of salt as a fertilizer, given to the public; and the question: "Is it a fertilizer in any degree?" remains unanswered, so as to settle the question forever. If we refer to all that has been said about its use by farmers, in the agricultural press during the last twenty-five years, we shall find a large number who claim that they have used it to advantage, while as many more say that they could see no benefit from its use; and the facts in the case appear to be about as follows: In the vicinity of the ocean, where the dews are somewhat impregnated with it, salt is of no value as a fertilizer; but in the interior it is of slight benefit to all crops, but not sufficient to warrant its purchase at the regular market value. At the saltworks at Syracuse, N. Y., damaged salt can be bought for about ten cents a bushel; and at that price, with short transportation, it will pay to use it. It may be used to a good advantage when mixed with ashes, as a fall top-dressing for grass lands; and also on lands to be plowed in the spring, as the virtues of both salt and ashes during the winter become disseminated through the surface soil. If applied in the spring to land that is to be plowed for any crop, it should be spread by hand upon the surface after plowing, and harrowed in.

A FARMER'S ICE-HOUSE.

Every farmer should have one, not only for the profit in it, but also for the luxury it affords. You don't require a carpenter to make one, as you can build it yourself, not *under* ground, but on the surface. Select a shady place if you can; if not, put it in the "blazing" sun, and I will guarantee that the ice will keep well, if you follow my directions: First, select your location, and then draw in a few loads of sand, gravel, or any light soil to raise the bed, about twelve feet square, a few inches to carry off the drippings of the ice. Then lay the sills of 4x6 timber (hemlock will do) and put up the frame; posts 8 feet high, 4x4; plates 3x4, with studs 2x4; and with a couple of 2x4 ties across from plate to plate, to prevent the building from spreading when full of ice. Hemlock weather-boards will do, if your object be to build a very cheap house. The roof should have a double pitch, and be quite steep, to be covered with sound boards and battened over the cracks. In one end of this roof, the shady end, have a window about 12x18 inches to allow the heated air within to escape. The door also should be on the north side. When you are ready to put in your ice, lay down some loose boards as a floor, on which you put sawdust, eight or ten inches thick, at the same time having a supply to pack at least twelve inches thick around the ice, as it is put in.

To cut out the ice, you need an ice-saw, some six feet long with one handle. Such a saw as is used for sawing logs may be used, with one handle removed. Saw the ice in square blocks, and pack it close in the ice-house, filling the openings with fine ice as you proceed with each layer, and the whole will become a solid body of ice. The ice should be at least a foot from the building on all sides; and this open space must be filled with sawdust, well packed down; at the door-way put loose boards, as the filling proceeds, to keep the sawdust in its place. Also put sawdust, about a foot deep, on the top of the ice, when the building is full. If your ice-house is to be built in a sightly place near your dwellings, it would be better to employ a carpenter a couple of days, and put up a nice building, clapboarded, shingled and painted—all complete for about $25. Such an ice-house as the above cannot possibly fail to afford a supply of ice for any family through the entire season; and probably one only *ten* feet square would be large enough for farmers. Think of a farmer's family living, year after year, with no place to keep butter, fresh meat etc., when for $25 a fine, commodious ice-house can be built!

SUPERPHOSPHATES AND GROUND BONE.

The most reliable commercial fertilizers of the day, are the superphosphates and ground bone, or flour, as it is called. Originally, we had simply "phosphate of lime"; but in later years the manufacturers added oil of vitriol (sulphuric acid) to make it soluble—that is, in a condition in which plants can draw sustenance from it immediately; and they now add the prefix "super." Some manufacturers add potash and other fertilizers; and, probably, no two make the same article, as regards constituents. We will take an ordinary superphosphate that is sold at $43 per 2,000 pounds by one of the most reliable dealers in New York. It contains as follows, as per his own circular: Ten per cent. of soluble phosphoric acid, and three per cent. of ammonia, worth about $30. These two constituents are all that a ton of 2,000 pounds contains of *plant food*, the balance of about 1,740 pounds, may consist largely of land plaster, or of dried swamp muck, or of something else of no great value.

The difference between superphosphate and ground bone is that the latter is composed more of bones; and, consequently, contains more phosphoric acid; and these two fertilizers are seldom applied to land without showing a benefit to crops, especially wheat, corn, rye, turnips, beans, peas and carrots, as all of these draw considerable phosphoric acid from the soil. The way that superphosphate and ground bone should be applied to lands to be cropped, is to sow them on the land, after it has been plowed and harrowed once, then cross-harrow the fertilizers in. Superphosphates ought to embrace all the essential constituents of a fertile soil, as potash, nitrogen, and phosphoric acid, and some are thus made. They then approach a "complete manure," like stable dung, and will give better general satisfaction. From 300 to 500 pounds of these fertilizers are generally applied per acre.

"COMPLETE MANURE."

The following "complete manure" is sold in New York, and said to contain as follows:

"Ammonia, 7.69 per cent.; phosphoric acid, 5 per cent.; and potash, 7.59 per cent." This is what is called Professor Ville's formula; and it has been before the agricultural public of this country and Europe many years. It comes, perhaps, as near stable dung, in its results, as it is possible for commercial fertilizers to do; but it is absurd to say that the proportion given must be exactly as the formula calls for, as 7.69 per cent. of ammonia, when 7.25 or 7.75 would undoubtedly show as good results.

NOTES FROM MAPLEWOOD FARM.

HECTOR BERTRAM.

HANDLING FENCE POSTS.

February is, without doubt, the best time to cut fence posts, and all rail timber, for that matter. It is evident to us from what experience we have had, that if cut then they will last much longer free from rot, than if cut at any other season of the year; and moreover, the farmer has more leisure at this time than in the spring and fall, when they should be set. We can have them cut, peeled, sharpened, and distributed where needed, so that as soon as the frost is out, they are ready for driving. Many people leave their fence posts from six to ten inches in diameter, making them heavy to handle, and difficult to drive. This, to our mind, is a needless expenditure of labor, and a waste of timber. Small posts season much sooner and last fully as long as large ones, and if they are driven deep enough, two feet at least, form a strong fence. They should always be peeled before the time for setting, and the latter should be done as soon as the frost is out, before the ground settles. We can then get them down deeper, and they will be firmer.

ERROR IN PITTING POTATOES.

A neighbor opened his potato pit the other day. He was led to this by noticing that the snow was all melted off on top of the pit, although there was plenty about it. Upon removing the earth and manure from the potatoes, he found that they had been buried too deep, and were reduced to a rotten mass in consequence of heating. Out of forty-five bushels buried last fall, he can save only four or five bushels fit for eating. Potatoes, like apples, need just enough covering to save them from frost, if buried; and if stored, a cool, dry, well-ventilated cellar is the proper place.

SCRATCHES IN HORSES.

A horse was troubled with scratches, owing to neglect in grooming. The joints were badly inflamed and swollen, causing lameness. As soon as noticed, the diseased parts were thoroughly cleansed with castile soap and warm water, and an ointment of the pulverized root of Indian Turnip (Arum triphyllum) mixed with boiling lard, applied and allowed to cool. It was well rubbed in with the hand, and after a very few applications a cure was effected. The limbs of horses should be well rubbed with straw every night when working, whether any mud adheres to them or not. There is nothing that will rest

a tired horse, quicker than this practice. They should always be rubbed until the blood obtains a free circulation, or until they feel warm to the hand.

DESTROYING STUMPS.

Mr. MINER, in a recent article, suggests "blowing up stumps." We have heard of a better way, if it proves all that it is recommended. Bore a hole with a two inch auger, to the depth of six or eight inches, into the stump to be operated on, and place therein one or two ounces of saltpeter, then fill the hole with water, and plug it up perfectly tight. Next spring take out the plug, pour in a gill of kerosene oil, and set it on fire. It is claimed that the stump will be entirely consumed even to the smallest roots, thus doing away with the trouble of removing the *debris*, which would be scattered about by the other method. Let some of the RURAL readers, bothered with these unsightly nuisances try the experiment. It is inexpensive and can do no harm, if it does no good. There is nothing upon a farm that detracts so much from its good appearance as stumps; especially when they are, as is too often the case, embowered in a rank growth of briers and bushes.

PLASTER AND ASHES.

Our Agricultural Society held an animated discussion recently, on the benefit to be derived from the use of plaster. Some recommended its use in a dry season, some in a wet one. One claimed it should be applied to the seed before sowing or planting, another would sow it broadcast, or apply it to the growing plant. A person wishing to learn the comparative profit obtained from the application of a ton of plaster, would have been as much in the dark after, as before he had listened to the discussion. Our own experience is that it is utterly worthless during a wet season, and hardly profitable in a dry one. We never saw any good effects from its use on grass, unless that perhaps the aftermath was somewhat thicker. The clover crop is increased by its use, yet if our land is in passable condition, clover will do well enough without it. We have tried it upon potatoes, but without result save a heavier growth of vines—no more potatoes than on rows close by that had received no plaster. It will increase the growth of cornstalks, but we have no more corn than on that where it has not been used. We believe that it increases the growth of straw, but not of grain. Yet results from its application might be different in different localities. Ashes are, to our mind, the best fertilizer we can use. Either leached, or unleached they are a benefit—a great benefit to any crop on which we have ever used them. We once raised some of the largest beets we ever saw, where a leach had been emptied, and the beet bed was about half earth and half leached ashes. We would not think of planting corn unless ashes were used in the hill, and about the young plants when they are up three or four inches. If farmers realized the value of ashes, they would be more careful to save them all. Plaster *may* be good, but ashes are much better—for grain crops, at least.

SPANGLED HAMBURG FOWLS.

Two years ago we purchased some eggs of the Spangled Hamburg variety, and we are so well pleased with these fowls that we keep them only, having disposed of our old stock—Buff Cochins and Leghorns. The eggs of our favorites are small, as are also their bodies, yet they are the greatest layers we ever had, and the easiest keepers. Our fowls will eat but very little, and seem to lay summer and winter with little intermission, scarcely ever wishing to sit. Last summer we were obliged to obtain hens of another breed to sit. Their dark legs are a slight objection, yet their good qualities overbalance all their little defects.

LOOK AHEAD.

Every farmer who has timber, should get a few logs to the mill for drag-timber, wagon tongues, and the like. Have them sawed and piled under cover so that next season, when work is crowding and a piece of seasoned timber is needed, you will know just where the desired article can be found without being obliged to spend the whole day in a search for it. Each one should have a chest of common tools, such as are necessary for repair work on the farm. It is much easier if we have the materials, to repair a broken harrow or other utensil, than to travel four or five miles to a shop for the purpose of *hiring* done what we could do just as well ourselves. Any articles that are liable to break, had better be attended to at once, and not laid aside with "I guess I can make that last this season, well enough." It will be sure to break when you are in a hurry. There is a world of wisdom in the old maxim, "Procrastination is the thief of time," and to no one is *time* so precious as to the farmer at the busy season.

WE have read in agricultural journals during the past two months the advice with slight modifications, to "stop up the cracks in the barn" forty-eight times! We are growing quite interested in the subject.

Farm Economy.

CORN ACCOUNT.

As this is the season of the year in which it is supposed that we poor "Mud Sills" take time by the fore-lock and lay out our work for the coming year, is it not also a time to look up past experience and see where we may profit by it, either as it has been a success or a failure? And how can we better accomplish this object than by conversing with one another through the medium of our agricultural papers, thus getting up an exchange of ideas which may prove of benefit to many of us? I will open the ball by giving my experience with a crop of corn in 1874. The field consisted of forty acres of Michigan sand. It was a timothy sod in the spring of 1872; planted to corn that spring, sowed to wheat the following fall, and seeded to clover in the spring of 1873; but it failed to catch, so that it was a bare stubble in the spring of 1874. In the figures used here, enough is charged to cover the board of man and team with each day's work. No value is placed upon the manure, the only charge being for the time spent in handling it, as it is considered that this crop did not receive all the benefit, but that part of it should be charged to future crops.

ACCOUNT WITH FIELD NO. 8.

1874.			
May 5,	To drawing manure to date		$50 00
5,	spreading "		12 00
8,	15 days plowing @ $3.00		45 00
10,	8 days dragging "		24 00
11,	1½ days marking "		4 50
13,	3 days, man and team planting		9 00
13,	3 days, man dropping		4 50
13,	6 bus. seed corn		6 00
13,	5 bus. potatoes, two rows round, outside		5 00
13,	1 day planting		1 50
25,	2 days " pumpkins		3 00
June 1,	3 days dragging @ $3		9 00
5,	5 days cultivating, man and team		15 00
19,	" " "		15 00
25,	7½ days " man and 1 horse @ $3		15 00
29,	" " "		15 00
July 5,	4 days " " and team @ $3		12 00
5,	plaster and time sowing		5 00
Sept. 5,	cutting by the acre, @ $1		40 00
Oct. 1,	digging potatoes		3 00
Nov. 1,	husking 2335 bus. ears, @ 4½ cts.		105 12
1,	11 days drawing and cribbing		23 00
Dec. 31,	1 years int. at $75 per acre @ 7 ₱ ct.		210 00
31,	6 months int. on labor @ 10 ₱ ct.		14 23
	Total		$655 85
Nov. 1,	By 1335 bus. corn 70 lbs. @ 70 cents		$934 50
1,	40 loads of stalks, @ $3		120 00
1,	pumpkins a failure		3 00
1,	potatoes " bugs		5 00
Dec. 1,	pasturing 70 sheep 2 weeks		5 00
	Total Receipts		$1067 50
	To outlay		655 85
	Net profit		$411 65

O. N. T.

Battle Creek, Mich.

SHIFTLESSNESS ON THE FARM.

MRS. A. E. STORY.

TUMBLE-DOWN fences or fences clumsily propped up and patched, here and there, with bits of broken boards and rails; gates hanging by one hinge, or leaning forlornly against the posts, with none at all—these are some of the signs by which even he who runs may read the story of many a farmers unfitness for the calling he has chosen. There surely can be nothing in agriculture, as a pursuit, calculated to make men shiftless, caring nothing for beauty or order, and yet shiftlessness crops out oftener, or at least is more glaringly apparent here than anywhere else.

If there can be any excuse for pride in a world where so little of what we have to enjoy is owing to ourselves, the man who can lay claim to, not merely earthly possessions but the possession of earth, has the best right to feel it. In a limited sense, he is monarch of all he surveys, and that he should prefer, in this survey, to behold ugliness where might be beauty, disorder and general topsy-turviness in place of order and neatness, is matter of wonder. Fields, whose fences are hidden from sight or nearly so by elder bushes and brambles, are not likely to prepossess the passer-by in the owner's favor, and yet an hour's drive through any part of the country reveals scores of just such fields. We rarely see good crops growing inside these "elder-berry" fences and we don't expect to. If we are told as a reason for this, that the land has been "run," we accept the explanation as a matter of course; for a farmer who will suffer his fields to be thus hedged about and encroached upon by what is both unsightly and worthless, is slack through and through. We are just as sure before being told as we can be afterward, that there is a mortgage on that farm. CINCINNATUS himself, dearly as he loved the plow, would never have been able to keep his head above water under such a system of farming as is here disclosed.

But the men who follow this down-hill way of tilling the soil, are not the only ones to whom the term *shiftless* may be applied. There are others wise enough to keep up their land and maintain a pretty good state of things on the farm generally, who yet seem to delight in a wretchedly loose state of things around house and barn. These men have studied arithmetic better than those above mentioned. They have learned that take "something from naught you can't," and govern their farming operations accordingly. That is about all the difference there is between them. And yet one might as well try to wind a sunbeam around his finger as to convince a man of this type of his shiftlessness. His yard fences may lean zig-zag in all directions, an excellent way for fences to lean, by the way, for thus they keep from falling out of pure contrariness; his kitchen garden may be neglected, or left to the care of the women and children; and as to what he would call "posy" beds, his geese and chicks run at will over the only spot where these could be located; the siding may be torn from his barn; his smaller out-buildings may be doorless; his wagons, plows and harrows, without paint, and exposed to the weather may serve as roosting places for his fowls; burdocks and "stick-tights," may make rampant growth along the pathways and among the berry bushes in the garden; all these things he regards as matters of no account, and if you refer to them as marks of shiftlessness, he has only to point to his bulging corn-cribs or wheat stacks to refute the charge. And the smile with which he does it, is enough to make you resolve never to try to open another man's eyes while you live. What matters a few burdocks anyhow? If you object to them as something particularly obnoxious, he will tell you with another smile, that the way burdocks grow on a piece of land is the best way in the world to tell what that land is good for. Show him a farm where burdocks grow as if they had no business on earth, and he'll show you a farm he don't want to own.

If his wife complains that she can't stir out of doors without having to put her skirts through a picking process to rid them of burs, he has a smile for her, too, with the information that country folks can't expect to have everything as "slick" as they do in cities, which, may be, she believes and may be she does not. Women, nowa-days, as a rule, are given to exercise their own opinion on such matters, and, if it was not that they likewise "exercise" butcher knives, corn cutters and such like implements occasionally, the traveler along country roads would see more burdocks, thistles and mulleins than roses growing in farmers' door-yards.

Now a word about these same door-yards. Why is it that they are so generally neglected? The fault may rest in a great degree, but not altogether, with the women. Flowers and shrubbery are out of the question where the yard is used as it frequently is, as a sort of convenience for the passage from the road to the barns and sheds in the rear, of everything brought in, from a load of hay to a drove of pigs. Fancy a tulip or a pansy trying to open its tender petals among the litter of such a door-yard! Nothing but "Live-for-ever," Ribbon grass, or Devil's flag, could make a pretence of growing there. And try how you may to bring about a state of things more "city-like," or exclusive in the way of position for flower plots, the front door-yard is the only place about a farm-house which can be made available for this purpose.

That farmers' wives, take them as a class, should care so little for trees and flowers about their homes, is to be regretted, and that chiefly for their own sakes. They need their soothing and refining influence, of which in their isolation and in the hard work of their every-day life, they stand in peculiar need. Trees they may regard as among the impossibilities. It looks a greater task to dig up and set out a tree, than it really is. Any woman possessed of ordinary strength, can do this and feel the better for doing it. And as to flowers—well, they don't want them, or they would find a way to have them. We wonder seriously, sometimes, how some persons are to enjoy heaven, since they care so little for all beauty here, whether it consists in flower, stream, or wood.

Field Crops.

NOTES ON SEEDS.

PROF. W. J. BEAL.

WEAK SEEDS produce weak plants. This has been shown time and time again. The seeds may be weak on account of small size, or because they were immature when gathered, or because their vitality had been impaired by keeping a long time after they were gathered, or by keeping them in an improper place as to moisture, or great extremes of heat and cold. Most seeds will grow if they are not fully ripe, as most farmers know to be the case with corn and wheat. As a rule, the feeblest specimens of a lot of seedling plants are most likely to produce the choicest flowers.

In England, it is believed that old seeds of melons and cucumbers are most likely to produce nice fruit and most of it. Light seeds may sprout quicker, but produce weaker plants: Professor CHURCH of the Royal Agricultural College, England, found:—That seed-wheat of the greatest density produces the densest seed and yields the greatest amount of dressed grain. The seed-wheat of medium density generally gives the largest number of ears, but the ears are poorer than those of the densest seed. Seed of medium density also produces the largest number of fruiting plants. The densest grains are not always the largest.

PROPER DEPTH OF SOWING.

This subject has been much discussed, and some have pretended to possess great secrets in regard to vegetable physiology. Seeds are sown and buried in the soil, to keep them away from birds and other animals, and to keep them at a proper degree of moisture. Acorns and beechnuts will sprout and grow readily when dropped on the ground, provided they are moistened and a mulch is thrown over them, as is usually the case, in the form of a light layer of leaves. The same is true of most other seeds. The proper depth for planting seeds depend on the texture of the soil and the state of the weather, or the climate in which they are to grow. No fixed, universal rule can be given for any species of seeds.

Very small seeds start best with only a very slight covering of finely pulverized material, and then a slight screen to prevent destruction by excessively dry weather. In sandy soil, seeds may be planted deeper than in clay soil, in a dry climate deeper than in a moist climate. In the light soil at the College Farm, the late peas do best if planted five to seven inches deep, while for the early crop, two inches is the proper depth for planting.

Dr. NEWBERRY has given an account of the planting of corn by the Indians in Colorado and surrounding country. The soil is subject to severe drought. To secure germination, they plant twelve or fourteen inches deep and often raise good crops. At our farm, peas usually come up if planted ten inches deep, but the plants will not thrive so well as when planted at a less depth. Finely pulverized soil is quite important to secure the best results with seeds for field or garden.

TIME REQUIRED FOR GERMINATION.

This depends on the variety of seed and on the state of the atmosphere. The seed of the mangrove usually sprouts before leaving the parent tree. Wheat sometimes grows in the head, as we all too well know. Some seeds with a hard covering will not germinate until the second, third, or fourth year. Seeds of this sort are those of the rose, hawthorn, dogwood, basswood; seeds of the mustard family start quickly, while those of the parsnip family start slowly.

TEMPERATURE FOR GERMINATION.

This varies with the kind of seed from chickweed which germinates near the freezing point, to the cocoanut which germinates at 120°. I copy the following table from Johnson's "How Crops Grow:"

	Lowest temp'ture.	Highest temp'ture.	Temp'ture of most rapid germination.
Wheat	41° F.	104° F.	81° F.
Barley	41	104	84
Pea	44.5	102	84
Maize	48	115	93
Scarlet bean	49	111	79
Squash	54	115	93

It would be an interesting experiment to try to learn whether the early Flint corn of Canada would germinate at a lower temperature than the large Dent corn of Missouri. We should expect to find some difference.

THE CHINESE YAM.

THE Chinese Yam possesses merits that should commend it to the agricultural classes of the United States, yet there are many who don't even know that it is grown in this county, although it is more than twenty years since its introduction here, from China. The difficulty all new beginners have to contend with in the culture of this esculent, is a proper understanding of its wants. I have grown them for twelve or fifteen years, and will give the readers of the RURAL the benefit of my experience:

In the first place, select a soil that is moderately dry, deep and rich, and prepare it by spading or plowing deeply: then plant the tubers eight inches apart each way. They will need to be cultivated a few times the first year, to keep weeds down and soil loose. After the first year, keep the weeds hoed off or mowed down, as you prefer. The Yams are perfectly hardy, standing in the ground all winter and growing again when spring comes, increasing in size for a number of years. They increase naturally from the small tubers that grow on the vines just above each leaf. These should be saved in the fall, and kept during winter where they will not freeze, as freezing injures their growth, and planted in the spring as soon as the ground gets warm.

As to the product per acre, in the best of soil, with three years' growth and tubers planted eight inches apart each way, we could safely calculate

on getting six and a quarter tons of Yams per acre. Some may think this a large yield, but I believe it is not as large as I should put it, and think it is not an overestimate. I have only cultivated them on a small scale but have come to the above conclusion with regard to their productiveness. A few years ago, I was digging in an old bed of them where they had been left to grow for several years, and such a sight! The ground was literally full of roots, measuring one and a half to two feet in length, and one and a half to two inches in diameter at the largest end, and this too where the soil was not more than eight or ten inches deep.

They grow in a perpendicular position with the large end downwards. The vines are ornamental, having heart-shaped leaves edged with scarlet and are very pretty. A few tubers planted near a door or window and the vines trained over and about it, make an ornament worthy the admiration of all. The flowers are numerous and have a cinnamon fragrance, but the vines do not bloom until the roots are two years old. In garden culture I let the vines run on the ground, except those I wish to save tubers from for seed. These I set stakes or poles to, as I think by this method the tubers are produced in greater abundance and of large size.

There is scarcely any difference perceptible to the taste between the Chinese Yam, when properly cooked, and the Irish potato, although the Yam is much whiter and somewhat finer grained.

Mr. M. H. Rose, of Dorchester Co., Maryland, in a communication to me, says in reference to the Chinese Yam: "I have been cultivating it for about seven years, and every year I prize it more and more. They are pure white when cooked, and are dry and mealy. We cook them either by baking or boiling. After this year I shall cease to cultivate the Irish potato."

Mr. Petit of Porter Co., Indiana, says, "I have often eaten them in different parts of the world, but did not know they could be grown in this part of the country, and often wished I could have some of them when potatoes were scarce."

They have no insect enemy, and drought affects them but very little, as they root so deeply. There is no necessity for their being dug at any time of the year, except when wanted for immediate use. They are suitable for cooking any time in the year. A person can plant enough at one planting to do his family for years, each year bringing him larger Yams. I consider them safer to depend on than the Irish potato which has its enemies and is so sensitive to a little freeze.

I believe their proper cultivation would be attended with success anywhere in the United States. If the masses of the people better understood their nature and were better acquainted with their many fine qualities, they would be more generally grown. In conclusion I will say that they are the most profitable crop that I cultivate.

Wm. Cruzan.

Horticultural.

SLITTING THE BARK ON HIDE-BOUND TREES.

I believe in the surgery. The hide-bound state, if sometimes, is not always the outcome of barron soil or starving culture. I have had it come on and stick to trees in deep, rich soil every year, well manured and opened up with the fork. It may be as Prof. Beal says, that "Hide-bound comes from trouble at the root." Or it may come from the air, or from insect sting—who knows? Until some one does, he has no right to guess, and to put out that guess as a fact. Even a right guess at the cause, under or above ground, does not support disbelief in hide-bound, or prove that ripping up the bark will not cure it. What means such unbelief and donbt? Not, surely, that such an ill condition does not befall trees, either bringing, or mated with, unthrift. You might as well disbelieve in a feverish skin, or in the sharp neuralgic pain, because they are perhaps only the register and symptoms of some deep, inner ail in life's machinery.

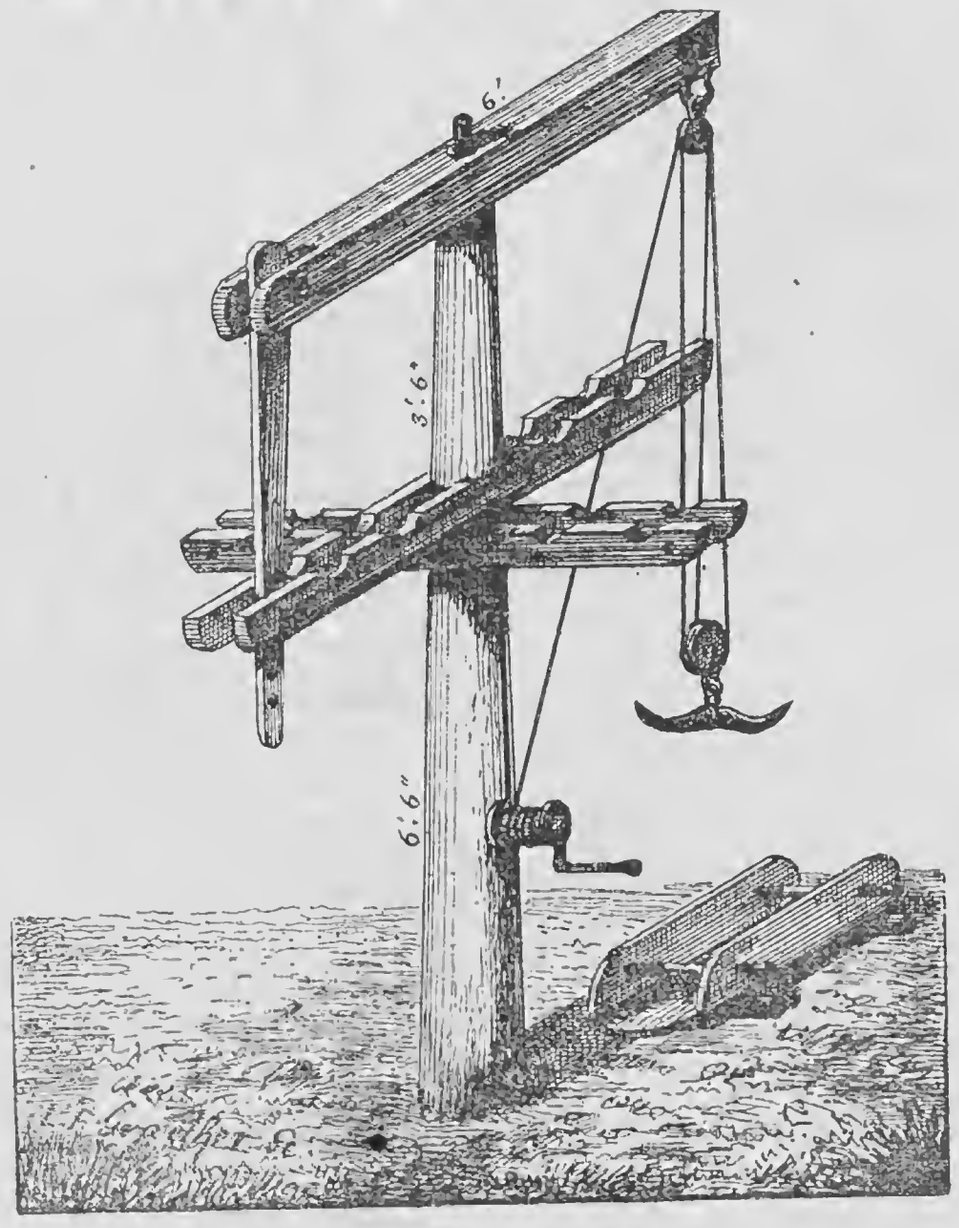
That some tree trunks take on a hard, tough, leathory bark, is beyond dispute. The trouble is sometimes brief; but it often clings and clogs all thrift for years. There it is—"What are you going to do about it?" Wait till the tree, from leaf and root tendril, gathers a force to rend the gripe? Or will you give quick help by slitting, more or loss in depth, that hide-bound bark?

The duty should be done at the season when the full force and vitality of the tree starts out for its summor's work. It will not do to slit the bark when the tree is dormant, or after the growing season has gone by. Trees, at the time of laying on their new wood, show a wonderful faculty for healing over any gash or rip-up of the bark. I have known a whole apple tree trunk stripped of its hide—along in June, I think—to heal entirely over, developing a new bark the same season. The stripping was done to stop the wood growth and make it bear. It answered the purpose.

The upshot of all this is, that slitting up the hide-bound bark is wise. It's a direct and speedy help, that will do till some one finds in the root or in the tree-top, the cause of hide-bound, and hunts up a better cure. Doubtless some wash on the tree trunk will ward off, and at some stages, relieve the hide-bound state. But is there any way so quick and sure as slitting up the bark? I have had success by this, time and time again. Such was also the experience of an extensive nurseryman here who, by the slitting process, helped his hide-bound trees.

Now, when we lay down this or that regimen as suited to the nature of growing things, we should not forget that a cultivated fruit has lost, or needs not, some of the primeval stamina of its kind. Among trees, as well as humans, the "survival of the fittest" is now hoped and helped for other ends, than to supply weapons and housing for a stalwart beast.

W. H. Noble.



APPARATUS FOR RAISING DEAD HOGS.

CATALOGUES, &c., RECEIVED.

J. M. Thorburn & Co., 15 John Street, N. Y.—There is no catalogue that we look over with more interest than the above, because we know from our own experience and that of many acquaintances, that everything it offers is the very best of its kind. This house was established in 1802, and we know of no other in this country more favorably known for conscientious and liberal dealings. The present Catalogue comprises 95 pages, descriptive and enumerative of seeds and bulbs for the vegetable and flower garden, for the lawn, farm and nursery, and probably represents one of the largest collections in the world. The Catalogue is free to all applicants.

John Saul, Washington, D. C.—Catalogues of rare and beautiful flower and garden seeds for the spring of 1878. Among the newer plants of which seed is offered, are Tuberous-rooted Begonias, Torenia Fournieri, Aquilegia chrysantha and cærulia, Arundo Donax, var., Zebra-striped Eulalia, Miles' now hybrid spiral Mignonette, and many others. Those who have files of the Rural for the past year will find many references to the above plants.

Also a catalogue of Roses. Both are free to applicants.

Wm. H. Carson, 125 Chambers Street, N. Y., issues a very attractive catalogue of vegetable and flower seeds, and also a select list of greenhouse, window, and garden plants. Mr. Carson has reason to thank his customers of the past year, many of whom testify to the excellence of his seeds.

He offers a number of excellent novelties for an appreciation of which the catalogue, which is free to applicants, must be consulted.

Alfred Bridgeman, 876 Broadway, N. Y. Annual descriptive catalogue of seeds of all kinds. Mr. Bridgeman selects from the general catalogue of seeds such species and varieties only as he deems worthy of cultivation, to the exclusion of all the various sorts that are not adapted to our climate. An experience of nearly twenty-five years in Horticulture, enables him to make such selections, and in this way protect his customers against loss and disappointment. The catalogue (which is free to all) is a model of neatness and plainness.

Mrs. J. B. Root, of Rockford, Ills., whose catalogue we noticed as free to applicants, desires us to correct the error, and to state that its price is ten cents. This we do with an apology.

The Vineyard.

EARLY CHAMPION.

G. W. Campbell of Delaware, O., wishes in the Rural, of Jan. 19th, to have the matter cleared up regarding the "Early Champion" &c. Now, in the first place, I would say that there is no such grape as *Early* Champion. Second, I know that the Champion and Tallman Seedling are one and the same thing. Now, I for my part, should not waste time, paper, ink or stamp if I did not know this to be a very important subject. I, for instance, having had about thirty-five kinds, should have been very much annoyed, to say the least, if I put out vines which are recommended to me to be about two weeks earlier than the Hartford, and then, after two years of waiting have to find to my sorrow that they are the same, or something later. Now in order to confine myself to the subject, I will give Mr. Campbell and those interested, the true history of the Champion. Only this much I would say, that if he had noticed the different articles which appeared in the American Rural Home on this very same topic, it would have been cleared up before this.

In the garden of Mr. Tallman of Syracuse, N. Y., a chance seedling came up which seemed to have two kinds of fruit, one much earlier than the other. Mr. Will. Day, an English gardener took it up and found that there were two distinct vines, and planted the earlier sort in his own garden.

It proved to be much earlier than anything else, and he propagated the same. About ten years ago, a man by the name of Spaulding bought the plants of Mr. Day, and sold them in the town of Greece, where he used to live, as the "Champion" grape. Four years ago, I changed my place of residence to Lake avenue on Lake View; there I got acquainted with a dealer in produce, fruit, etc. That man, Mr. Bady, put me on the track of it after he found out my business, telling me that they generally pay from 20 to 25 cents for those Champions. After satisfying myself that it was earlier than any other, I went to those men that had them, and pruned their vines for the wood, and planted the cuttings in spring, and in two years and a half the most of them showed me their first fruit.

Grape culture is my occupation, and I have been brought up on the vine-clad hills of Germany, and I hope your readers will not misunderstand me, but for the sake of truth, let me tell that the Champion is at least ten or fifteen days earlier than the Hartford; as good and more productive than the Concord.

E. F. Ellwanger.

Lake View Place, Rochester, N. Y.

Industrial Implements.

APPARATUS FOR RAISING DEAD HOGS.

I send, in answer to R., of Watervliet, Michigan, a drawing of an apparatus for hanging hogs without "lifting until one can see stars." The post is ten feet high above the ground; the arms are made of two-inch plank, six inches wide and six feet long, bolted on each side of the post five inches apart, the bottom of the upper ones resting on the top of the lower ones crosswise; the piece across the top of the post is three inches square and six feet long, and works on a pivot so that it can be turned to bring the pulleys over either arm; one end is fastened to the outer end of the arm, and the pulleys are hung on the other end; the windlass is two inches in diameter where it goes through the post, and four inches where the rope winds; it takes thirty-six feet of half-inch rope and one single and one double pulley. A boy twelve years old can raise a 400-pound hog.

A box as presented, sixteen inches wide and three and a half feet long, can be made with rollers under it, and the hog may be rolled on a plank from the scalding platform to the place for hanging without lifting at all; or it may be carried by the handles on each side. G.

Jack's Reef, N. Y.

The Garden.

EXPERIMENTS WITH TOMATOES.

Rural Grounds, Jan. 1, 1878.

Earliness in Tomatoes is a quality of much value, if too much is not sacrificed in other good qualities. So far, however, as our experiments extend, there is no earliest Tomato. That is, if all known varieties were planted under the same conditions, the first to ripen fruit might not be the first to ripen under other conditions. It is the same as regards fruitfulness and to a certain extent, size of fruit. Each locality must determine for itself the kind best suited to it. But it is the same with tomatoes as with other fruit—there are some varieties that will hold certain characteristics in a greater variety of soils and situations than others, and it is for this reason that experiments such as those recorded below are valuable,

April 1 we planted in 5-inch pots, seeds of ten varieties.

April 10, all had germinated but Little Gem. The germination was in the following order: Trophy, strongest, tallest, largest cotyledons; Conqueror—Arlington—Golden Trophy—Hathaway's Excelsior—Green Gage—Canada Victor—Emily—100 Day. Little Gem made its appearance not until April 14.

April 18—Three of each were transplanted into 2½-inch pots—plants about 2½ inches high, all but Little Gem. All were put out in the open ground May 17. No manure was used—the soil rather clayey. Ten days later would have been better. Through fear of frost, they were covered with flower-pots for several nights.

For those who raise their own tomatoes, we commend the plan of starting the seeds in flats or pans of good earth, and transplanting them into small pots of light soil as soon as they are in true leaf. They may then, at the proper time, be thumped out and set in the garden without derangement, and stronger stems, more roots, and a quicker establishment will be the consequence.

Little Gem (B. K. Bliss)—June 23, first set tomatoes. July 24—2 ripe tomatoes, the first of all; 1 and 1¾ inches longest diameter. Round, without seams; both cracked. Aug. 2—Ripened 6; all small, but entire and good. Aug. 7—11, all very small, splitting or breaking open and molding when ripe. Aug. 10—10 ripe, 1 and 2 inches diameter. Aug. 11—25, all small; some rotted, others cracked. Aug. 19—70, one-third decayed—sour and fermenting. Aug. 23—105, same as others, but are firmer than those which ripened earlier. This is the earliest of all, and in the sandier, drier soil of the Rural *farm* grounds, cracked and rotted less than recorded above.

Conqueror (J. M. Thorburn)—Aug. 1—Two, ripened evenly, large, and curved like a horse-shoe. Aug. 3—1 entirely ripe to the calyx,

6½ inches largest circumference. Aug. 5—5 ripe; large, roundish, not acid. Aug 7—4 well-ripened—7, 7½, 6½, and 6 inches circumference. Aug. 10—2 of good size, perfect form. Aug. 11—medium size, soft. Aug. 19—33 medium to large, soft, cracked. Aug. 23—63. Sept. 2—Many on the vines, mostly ripe, lobed; many like 100 Day. Sept. 23—are now of a fine deep-red color, well ripened.

100 DAY (J. A. FOOTE).—June 12—3 in bloom. June 25—second to set tomatoes. Aug. 3—one smooth, round, well-ripened, deep-red, 6 inches largest circumference. Aug. 4—5 ripened; small; 1 to 1½ inch in diameter. Rather large seeds, acid. Aug. 7—2; 6 inches in circumference; lobed. Aug. 10—4; deeply lobed, and ill-shapen. Aug. 11—12 very irregular, all small. Aug. 19—70: firm, ripening all over; small to medium; much lobed. Sept. 2—Of those on the vines, nearly all are ripe, small to medium, lobed and ribbed; evenly and perfectly ripened; this variety ripens the most of its crop before Sept. 10. Sept. 23—a few mostly green.

CANADA VICTOR (W. H. CARSON)—July 26—the second to bear a ripe tomato—1¾ inches in diameter—no seam or crack. Aug. 3—ripened 2; round, palish or pinkish-red, the largest 7 inches in circumference. Aug. 5—1 ripe, 10 inches in circumference; irregular. Aug. 10—4, large, knotty; green about stem. Aug. 11—1, 8 inches in circumference; smooth. Aug. 19—40; smooth, above medium, firm; not very well ripened about stem. Aug. 23—60 medium. Sept. 2—Mostly green; vines less thrifty than others. Sept. 24.—Many on the vines still, and most of them ripe.

GREEN GAGE (B. K. BLISS).—June 12—1 plant in bud. June 26—third to form (set) tomatoes. Aug. 3—ripened 2—greenish-yellow about calyx, red otherwise, not yellow, as heretofore; a few yellow; extremely sportive; round, 6 inches circumference. August 5—4 ripened; all small, well ripened, smooth, not acid. August 7—1, 6¾ inches in circumference; very smooth and round; lemon-yellow. Aug. 10—variable in color and size; largest, 8 inches circumference; round perfect, lemon color. Aug. 11—red color, size of hens' eggs; 13, 5 yellow; 8 red, averaging 7 inches circumference; 9 averaging 8½, all red; some lobed, others not; we have never before noticed so many different looking tomatoes upon individual plants; this variety was unusually true in previous years. Aug. 19—14 red, 25 yellow; all of same general shape. Sept. 2—mostly green; ripen only a few at once; all green on one vine. Sept. 23—a few ripe, for the most part *red*.

GOLDEN TROPHY (B. K. BLISS).—Aug. 6—first ripened; light, pale-yellow—even lighter than what is understood as straw-color; solid, agreeably acid, few seeded; round, well ripened, beautiful. Aug. 10—4, rather irregular-shaped, but very large; a rough, dark-brown skin forms in patches upon some. Aug. 11—4, averaging 8 inches; irregular. Aug. 19—25 large, smooth, half lobed—half not; the dark-brown blotches disappear; average 7 inches circumference. Sept. 2—many on the vines half ripe; not so desirable at this time as earlier; do not ripen fast enough. Sept. 23—laden with tomatoes nearly ripe.

HATHAWAY'S EXCELSIOR (J. M. THORBURN).—Weak-looking plants. June 12—1 in bud. Aug. 5—two ripened, largest 9½x6 inches in circumference; fine flavor; less acid than any others ripened up to this date. Aug. 10—2, round, fine. Aug. 11—4, medium size. Aug. 19—38 soft. Aug. 23—43. Sept. 2—A few continue to ripen daily, but three-quarters remain green upon the plants. Sept. 23—have more ripe tomatoes at this time than any others.

EMILY (RURAL Grounds selection for four years from a variety that had been selected for three years)—June 12—1 plant in bud. Aug. 1—1 ripe—eight inches circumference; flattened; ripe all over, firm, smooth; plants full, all large and about same size. Aug. 7—One 8½ inches circumference, smooth, slightly green about stem. Aug. 19—very large, some 13 inches in circumference, entirely smooth. Aug. 23—27. Sept. 2—large, firm, sound; average as large as Trophy, but of a more uniform size and shape. Sept. 23—mostly green.

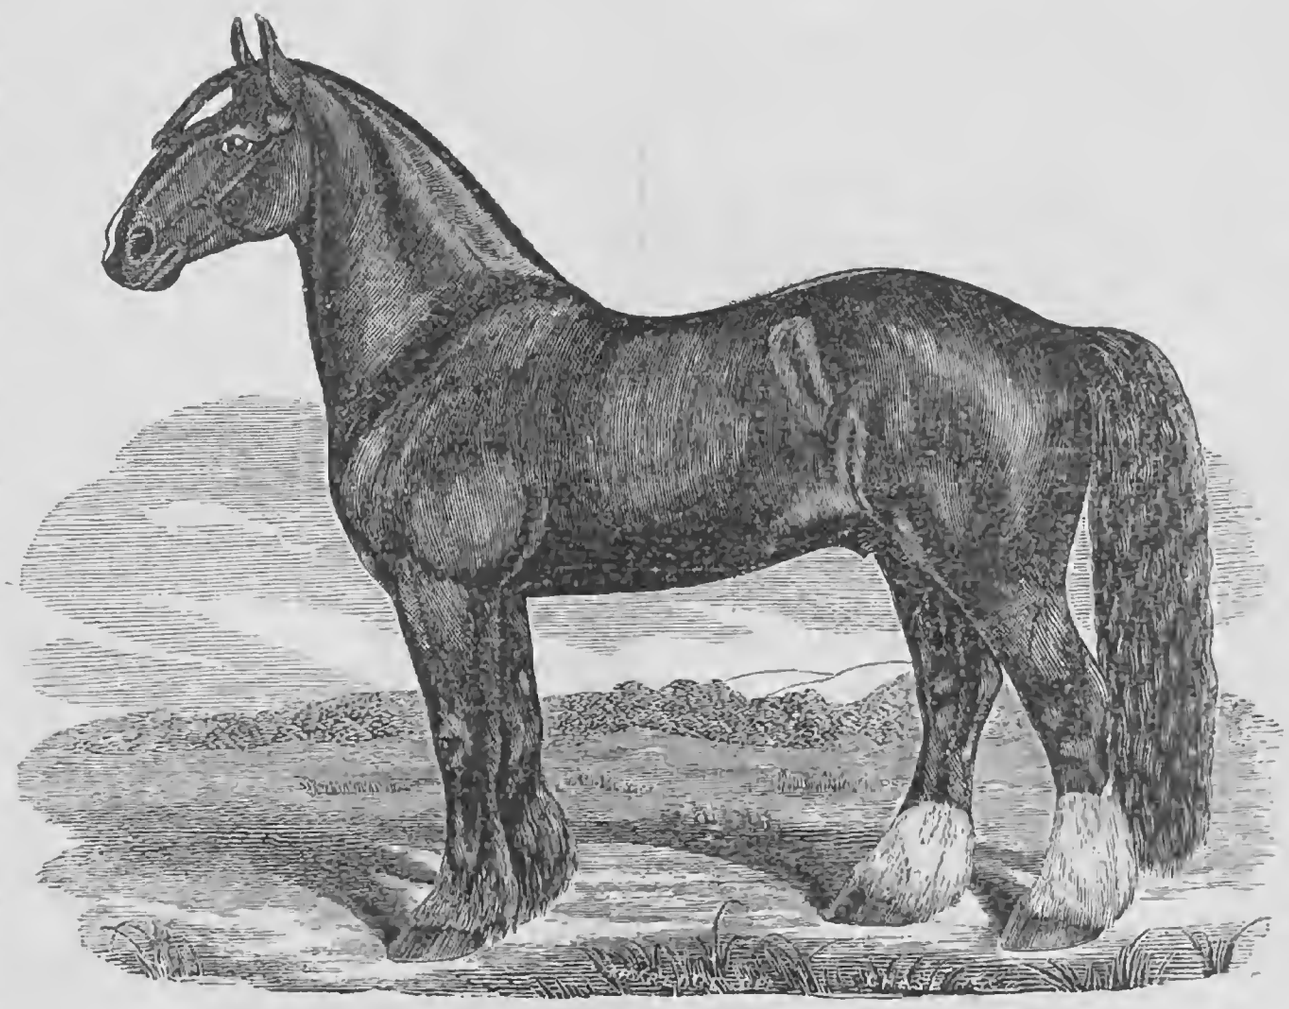
THE TROPHY (W. H. CARSON).—Extremely vigorous plants. June 12—1 in bloom. June 26—several sets formed. Aug. 1—1 ripened, 7¼ x8 inches circumference; round, smooth, green about stem, the green spreading over parts of the fruit. Aug. 19—6, averaging 12 inches circumference; fine, smooth, not well ripened about stem. Aug. 23—21, immense. Sept. 2—One-third of the tomatoes on plants ripe.

ARLINGTON (J. M. THORBURN).—Aug 19—5 very large, well ripened, quite smooth. Aug. 23—23, medium. Sept. 2—one-quarter upon vines ripe. Sept. 23—Many large, green fruit.

SUMMARY No. 1.

Ripe Tomatoes picked up to August 11:

Little Gem; small seamless	29
Conqueror; large-lobed	14
100 Day, much seamed, like a musk-melon; small to medium	12
Canada Victor; small to medium	8
Green Gage; extremely variable in size, color and form	7
Golden Trophy; whitish yellow, large	5
Hathaway's Excelsior; medium to large	4
Emily: large, even, smooth	2
Trophy; extra large	1
Arlington	0



CLYDESDALE STALLION "KING OF THE EAST."

SUMMARY No. 2.

Picked from August 11 to August 27—Prof. BEAL's first date inclusive. (See his report.)

1. Little Gem	200
2. Canada Victor	101
3. Conqueror	96
4. Hathaway's Excelsior	85
5. 100 Day	82
6. Green Gage	52
7. Golden Trophy	29
8. Arlington	28
9. Emily	27
9. Trophy	27

REMARKS.—Judging the above varieties in this soil, climate and situation—for the *earliest* market variety, we should choose Little Gem. For the best and earliest, we should choose Conqueror, and next for the same reasons, 100 Day. For the best Tomato, without regard to earliness, we should choose the Trophy for a red and the Golden Trophy for a yellow.

SPRING WORK.

TOMATO SEEDS should be started in boxes in February. Have fruit cans divided half way between the ends and make holes through the end pieces or cut them out altogether; fill these with mold, and when the plants have the third leaf, transplant to the cans. Continue transplanting which may be done by exchanging the plants from one can to another. Transplanting strengthens the plants. As early as is safe, accustom them to out-door air by raising a window or setting them out of doors through the warmest part of the day. Never fail to put them out-of-doors during warm rain. As soon as there is no danger of frost, transplant to the garden. Plants raised in this way are far more prolific than hot-bed plants, though a few of the latter are desirable for early bearing. We have been best suited with the Trophy.

PEA seed should be the first put in the ground. As soon as a hole can be dug deep enough to put in the seed, have them planted. The ground should be prepared in the fall. The best crop of peas we ever had was put in during a thaw in February. They came up and the rain fell, frost came, and snow covered them, but still they flourished. They bore earlier and for a longer time than any vines we ever had. The ground had not been prepared in the fall, so that a great deal of work was necessary through the spring to prevent the soil baking. Sow both early and late varieties at the same time. About the early varieties there are divers opinions, but for late ones, nothing can excel the English Marrowfat. This year we intend to try fall sowing.

LETTUCE, radish, spinnach and pepper-grass, also a bed of beets for early greens should be planted as soon as the ground can be raked deep enough to cover the seeds.

For starting melons and cucumbers in-doors, the best pots are small pieces of sod-turned grass-side down, and placed upon a board. When the season is warm enough, set out in the garden, having rich, loamy soil covering all but the leaves of the plants.

CAULIFLOWER plants can generally be bought better than they can be raised, unless a person has abundance of time and garden room. Set out summer cabbages in May or June, according as the season is cool or warm; winter cabbages and cauliflowers in June or July. Transplant during wet weather, if possible; fill each hole with water before setting the plants and shade for a few days.

POTATO patches in late years have not been held in good repute in small gardens on account of the potato bug; but we have found our potato patch as profitable and convenient as any part of the garden. Of course, the bugs come, but the city bugs are no worse than their country cousins and both yield alike to the influence of Paris-green. Plant as early as possible in April in a loose, sandy soil. We have tried several varieties but, all things considered, for an early potato we prefer the Early Rose.

Dig a trench for celery. Buy your plants if you have no hot-bed.

HOT-BEDS.

A GREAT mistake, made by many novices in gardening, is to use soil in hot-beds which is *too heavy*, so that the frequent waterings pack it down tightly, and the hot sun bakes it so hard that nothing can grow in it as it ought. The soil for this purpose should be much lighter and looser than common garden soil usually is.

WATERING.—Although the covering of glass holds moisture from escaping as vapor to a considerable extent, the shallowness of the soils will not enable it to hold water for a great length of time during sunny weather, and the beds have to receive an artificial watering frequently.

The best time to perform this work is about four o'clock in the afternoon.

I. F. TILLINGHAST.

The Horseman.

CLYDESDALE STALLION "KING OF THE EAST."

THE improvement of farm horses is deservedly attracting a great deal of attention in this country at present. Improvements in our methods of farming necessitate an increased amount of horse-labor, and as we manure more heavily, plow deeper, and use labor-saving machinery more extensively, we are more alive to the want of horses heavier than those common on our farms. Formerly when the country was newer, much of every farm in timber, and reaping, mowing and cultivating done by hand, a farmer owning a hundred acres, could do all the work with a single team. Now, the large acreage under cultivation on every farm, the settlement and culture of our prairie lands and consequently the extra demand for team labor make it necessary that we should have more and heavier horses. To supply this want farmers and breeders have imported different breeds of European horses among which the Clydesdale deservedly holds a prominent place.

The origin of this breed is attributed to an ancient Earl of Huntingdon who imported into the district of Clyde, Scotland, some Dutch mares, a strain then highly valued, and these being crossed with the native breed became the progenitors of the renowned Clydesdales. For the most part these are powerful horses, standing about sixteen hands high, are extremely active, and in the south of England they are largely used for the saddle and coach as well as for agricultural purposes. Their prevailing color is black but there are also among them many browns and a few grays. A pair of Clydesdale horses will plow a greater breadth of land than almost any other kind of horses, but they require to be well fed. For cart-horses, especially for one-horse carts, there is no description of horse better adapted than the Clydesdale, or that can get through more work in the course of the day. Their merits have secured them a high reputation and a ready sale not only throughout Great Britain but wherever the English language is spoken, and they have therefore been extensively exported to the English Colonies, and, to a less degree, to this country. One of the best specimens of the race imported among us is "King of the East" the property of Messrs. SMITH & POWELL, Syracuse, N. Y.

King of the East was selected in Scotland as a superior representative of the Clydesdale stock, by an agent sent over expressly for that purpose. He was imported in 1875 and was four years old last May. He is a dark dapple bay 16¾ hands high and now weighs 1800 pounds. He was sired by "the Marquis," by the "Pride of Galloway;" dam "Lovely," by "Loch Fergus Champion," he by "Salmon's Champion." All these were very celebrated prize horses in their native Scotland. The accompanying illustration gives a very accurate idea of this noble animal from a side point of view, but to justly realize his remarkable power, it would be necessary to see his unusual depth of chest and immense quarters and loins.

The same gentlemen have now on hand at their breeding establishment—one of the most extensive in the country—130 horses of Clydesdale and Hambletonian blood.

BULBS FOR THE FLOWER GARDEN.

W. C. L. DREW.

SNOW-DROP. SNOW-FLAKE.

WHAT fond remembrances cluster around the delicate Snow-Drop, the first to herald the spring and bid stern winter withdraw his forces, that the vernal flowers may come forth once more to gladden the heart of man.

Every one hails the Snow Drop with gladness. Its appearance about the first of March is a joyful surprise. Defying the cold, it lifts to view its tiny blossom, whiter than the snow, long before the latter has disappeared, and when no other sign of vegetable life can be seen.

Of this general little favorite we have double and single varieties. The former is known botanically as Galanthus nivalis flore pleno. The flowers are very large and double; they resemble, on a small scale, the popular Peonies, the center of the flower being composed of a number of closely-set petals, around which there is a circle of larger guard petals.

The single Snow-Drop is known in botany as Galanthus nivalis: the flowers are bell-shaped and drooping. The bulbs are quite small, averaging about half an inch in diameter; the plants grow about six inches high, being just the thing required to border beds of larger growing bulbs, or they may be planted in masses of a dozen or more, or in beds.

Plant in the fall; they grow in almost any soil or situation; set the bulbs two inches deep and the same distance apart. They should not be disturbed for several years, when their flowering quality will be much improved. If a few are planted over the lawn they will be found very satisfactory. For house culture they are very attractive. A dozen bulbs may be planted in a six inch pot, and form one of the most attractive objects in the window garden. They flourish in sand or moss, and thus may be used in many ways; for instance, around pots in a window box.

The Snow-Flake resembles the Snow-Drop, but it is of a much larger growth and more robust habit: it is sometimes called the large Snow-Drop, but much oftener St. Agnes' flower, from the fact that its purity and beauty have caused it to be dedicated to the patron saint of young virgins, Saint AGNES. The botanical name is Leucojum vernum.

It grows to the hight of one foot; the flowers are very large, pure white, with green spots; they hang pendant from the top of the flower stem. Once planted, it grows freely, and manages to take care of itself pretty effectually for many years, blooming about a month after the Snow-Drop.

It does well in light, sandy loam. In very cold climates, it should have a light covering of straw. There is a late, or summer-blooming variety of the Snow-Flake known as Leucojum æstivum. It blooms about six weeks later than the spring variety and is much hardier. Both varieties are very pretty, and well worth the small space they occupy in any garden.

Domestic Economy.

CONDUCTED BY EMILY MAPLE

SIFTINGS FROM THE KITCHEN FIRE.

ANNIE L. JACK.

"We women grew old before our time," said a neighbor lately whose husband thinks a large dairy and no help a necessity in farm life. I thought of the cold and fatigue that must be experienced in this severe climate, where women do the milking, and have to reach the barn through drift and bitter blast at this season of the year, and did not wonder at the weary look and haggard face of my neighbor. What *is* harder than the life of a poor struggling farmer's wife? Paint the picture as bright as fancy can, say it is health, and plenty, and peace, I cannot discover it to be so, unless the farmer is forehanded, can sympathize with, and helps his wife, *in spite of herself*, for often it is a woman's own fault if she is overtasked.

She "can work away," and thinks the money earned will help to buy Janie a piano, or some other equally foolish purchase not worthy her self-sacrifice, when it were better employed in procuring for her own use all the labor-saving plans and helps within reach. If we were more interested in ourselves, we could manage better, but there is *so much* to do and to consider, and I would suggest to every farmer's wife, when she can visit any large city, to study the stores where hardware and house furnishings are kept, and get a practical knowledge how she can save her strength. The money invested in these things, will be more used and give greater satisfaction, than if spent in some needless finery. Another great waste of time and labor, is the constant, never-to-cease, need our family imagine they feel for *pie* as a dessert. While I do not hold, as many do, that this article as dessert *must* be unwholesome or indigestible, I am sure it can often be dispensed with. If our children were taught to eat fruit in its stead, the eye and palate might alike be tempted, for nothing is more ornamental than a pretty dish of glass or any other suitable ware, filled with the fruits in their season. The *pie* or any other delicacy would be better appreciated if not considered a necessity, and a woman's labor in preparing dessert greatly lessened. But our good housewife will say with pride; "My husband will not be satisfied with an apple or a bunch of grapes, a pear or a saucer of strawberries." I think he would, my dear "economist," if your pride will only allow him to know it is a glad and great relief to your dinner-burdened heart.

SYSTEM IN TABLE-SETTING.

Housekeepers would many times be spared the annoyance of missing needed articles, after being seated at the table, if they would pursue some system in its arrangement.

By way of explanation, when the cloth is laid, place upon the table the napkins, and if a child sits at table, its bib. Then the knives, forks, carving knife and fork, table-spoons, and tea-spoons. Next the plates, seeing that each is in its proper place and the number sufficient, then all dishes used in drinking, not forgetting the small children's. After the same method all required seasoning, such as cream, milk, sugar, pepper, salt, or if castors are used see that each bottle is properly filled, and thus proceed through each division. One soon becomes accustomed to system in this department, omissions are rare and the work is more easily and quickly done.

Mrs. H. L. Jones.

COOKERY FOR THE SICK.

Water Gruel.

Into a quart of boiling water stir two tablespoonfuls of Indian meal, previously wet with a little cold water; add salt and boil at least one-half hour. When served, pour a spoonful of thick, sweet cream over each saucerful, but do not stir into the gruel.

[Rice Gruel.]

Into one pint and a half of water put a large spoonful of unground rice and let boil until soft; strain; add one pint of new milk; and boil again for a few minutes. If ground rice is used, mix a spoonful of it with a little cold water and stir into the water; boil for five or six minutes, stirring constantly; season with salt and if the patient can bear it a piece of butter the size of a walnut; some season with sugar and nutmeg.

Raw Custard.

For diseases of the stomach when very delicate food is required, this custard is excellent. Beat up an egg with sugar to taste; add a cup of milk and whatever flavoring liked.

Tapioca.

This is also very harmless. Soak in cold water for two or three hours; cook slowly; serve with cream, sugar and flavoring.

Egg Soup.

Beat up an egg in a teacup, add salt, pepper, and pour over it boiling water to cook it a little; butter may be added if desired, also toasted bread or crackers. A variety of harmless dishes to suit the capricious appetite of an invalid is sometimes difficult to obtain.

Loretta E. K. Turner.

DOMESTIC RECIPES.

Lemon Jelly.

Grate two fresh lemons; add three eggs; butter the size of an egg and two cups of sugar; set into a kettle of boiling water and cook until it thickens, stirring constantly.

Hop Yeast.

Take six potatoes and eight good sized hops, and boil in three quarts of water, tying the hops in a bag; into a stone jar put one cup of flour, one cup white sugar, and one-half cup of salt; stir all together with a little of the boiling water the patatoes are cooking in; when the potatoes are done take the hops out and pour the rest of the water into the jar, leaving the potatoes whole; they must not be mashed but left in the yeast until it is used up, and then thrown away. Let the potato water cool before adding the yeast; set in a warm place to rise; when the yeast has risen, take out a pint and keep by itself to start the next with. To sponge the bread, take two quarts of new milk and scald—not boil; set away until nearly cool, then stir in some flour and add one pint of yeast. This makes four loaves.

Omelet.

Allow one egg for each person; beat two minutes; add salt size of a pea and one tablespoonful of milk for each egg; beat well together and turn into a hot, well-buttered frying-pan, cover and cook slowly until nearly all is thick; serve immediately.

Cream Pudding.

Six eggs, six ounces of sugar; one cup of flour; stir well and add one cup of sweet milk; salt to taste; then add one quart sweet cream and bake forty minutes; flavor with lemon.

Tart Crust.

One cup of lard; one tablespoonful sugar; four tablespoonsfuls water; the whites of two eggs beaten to a froth; a pinch of salt and flour to roll.

Cookies.

One cup of butter—cold, rubbed into the flour; one cup of sugar; four even cups of flour; two eggs; two-thirds of a teaspoonful of soda.

Marble Cake.

White Part.—Two cups of white sugar; one cup of butter; one cup of sour cream, the whites of eight eggs, two teaspoonsfuls of cream-of-tartar and one of soda; three and a-half cups of flour.

Black Part.—Two cups of brown sugar; one cup of molasses; one cup of butter; one of sour cream; five cups of flour; two tablespoonsful cinnamon; one each of cloves, nutmeg and allspice; yelks of eight eggs; one teaspoonful of soda; put in alternate layers of each.

A Farmer's Wife.

Everywhere.

RURAL SPECIAL REPORTS.

Cortland Co., N. Y., Jan. 22.

The weather in this locality up to the present date, has been very mild most of the time. The old saying, "a winter's fog will freeze a dog," has not proved true, this winter at least. I have not heard of any dog being frozen yet. We have had, the past season, abundant crops of grain and grass; the fruit crop was a fair one, and of good quality; our crops, taken as a whole, have bountifully rewarded the labors of the husbandman. This is a great dairy County, and every farmer has more or less cows. We have excellent springs of water, and all the best dairymen use coolers for their milk. While some of my brother farmers hereabouts travel in the old ruts, others are more progressive, and find dairying, with modern improvements, very profitable. I find those men that pay close attention to all the details of butter making, save all the manure, keep all the cows they can keep well, and only just so many—are the men that do not say anything about "hard times."

Charles Fairbanks.

Denmark, Tuscola Co., Mich., Jan. 21.

The country hereabouts has been settled only about thirty years, and does not propose to take a back seat in comparison with many of the older settled districts. It is a rich farming country, and products a good yield of all kinds of grain and vegetables. Most kinds of fruit do well except peaches; the winters are too cold for them; the trees die out in a few years. By the way, this is the best of all the winters I ever saw here. No cold weather to speak of, but rain, mud, and slush in abundance. Business dull, and wages extremely low. Wheat looks well so far, and there is an immense quantity sowed in Michigan this year.

S. E. O.

Brooks, Me., Jan. 23.

The winter here is characterized by its sudden changes. A severe snow, then a rain storm. Neither sledding nor wheeling. Stock doing well.

J. W. L.

The Herdsman.

DIMON STOCK FARM PAPERS.

JOHN DIMON.

No. I.—Ayrshire Cattle.

In choosing for my subject Ayrshires, I feel that I am treating a subject not as well understood by the average farmer and dairyman as it should be. Having myself, for upwards of fifteen years, been a breeder and dealer of this most useful animal in the dairy, and having made them a special study, owned and bred some animals as fine as I ever saw anywhere, I think I should understand my subject. Presuming this to be the case, I will give the readers of the Rural my idea of

A MODEL AYRSHIRE COW.

She should be of medium size, weighing, in good milking condition, not to exceed 1,000 lbs., or less than 700 lbs., live weight—about 800 lbs. I prefer. She should be dark-red and white, brown and white, or brindle and white in color, having more of the dark color than of the white. I prefer her to be two-thirds red-brown or brindle to one-third white. She should be beautifully spotted or mottled, and present a nice contrast of colors; the head small, fine and clean; the face long and narrow at the muzzle, with a sprightly, yet generally mild expression; eye small, smart and lively; horns short, fine, curved upward and slightly inward, and set wide apart at the roots; neck rather long and quite thin; body tapering from hind to fore-quarters, or what we call "wedge shape," the fore-quarters being much the lighter; back straight and narrow, but wide across the hips; bone fine; tail long, with very fine bone and good switch; hair very fine and soft; udder capacious, extending well forward; teats of fully medium size, set regularly and wide apart; milk-veins prominent and well developed; legs rather short and well shaped, very smooth and clean. On the whole, she must be so put together as to be handsome—so handsome as to attract the attention of the most casual observer. When you see a cow filling the above description, you will see not only an Ayrshire but a good dairy cow.

As to the milking capacities of these cows, I am fully satisfied, by long experience, that, as a breed, they will yield more milk, for the amount of food consumed, than any other breed; and for a milk dairy they stand at the head of the list of all breeds. Their milk is also exceedingly rich in caseine; hence they are exceedingly valuable for the cheese dairy. And for all growing animals, there is no cow's milk equal to that of the Ayrshire, as it is more rich in bone and muscle-forming material than that of any other. I am often asked the question as to what breed of cow is the best for

A FAMILY COW.

My answer is: If you want *milk* for your children, there is nothing like the Ayrshire. I am often asked how much milk a good Ayrshire should give. This depends very much on circumstances. While our soil and climate, and especially that of New England, fall far short of the moist climate and more productive soil of the west of Scotland—the original home of the Ayrshire—I am happy to be able to show you that even here, in our own sterile New England, cows of this breed have given quite satisfactory results. I will instance a few cases only:

The imported cow "Jean Armour" in 1862 gave an average of 49 lbs. 3 oz. of milk per day, for 114 days, commencing June 1st. The greatest yield in one day was 58 lbs., and the smallest yield was 43 lbs. For the month of July she gave an average of 51 lbs. 13 oz. per day. Her milk for three days in July yielded 6 lbs. 3 oz. of butter. The imported cow "Corslet," imported and owned by the same gentleman (Mr. H. H. Peters), gave, from May 2d to Sept. 1st, an average of 46 lbs. per day, or in 122 days, 5 612 lbs. This same cow, "Corslet," afterwards gave her last owner, E. D. Pearce of Rhode Island, 28 quarts strained milk per day. The cow "Ayrshire Lass," when 11 yrs. old (in 1861), calving April 1st, gave, June 10th, 74 lbs.; Aug. 1st, 66 lbs; Aug. 31st, 55 lbs.; total for the month of August, 1,902 lbs.; and for the first 16 days in Sept., same year, she gave 848 lbs. The above statement of the yield of "Ayrshire Lass" was sworn to by her then owner, James Brodie of Jefferson Co., N. Y., before the N. Y. State Agricultural Society.

The Ayrshire cow, "Flora Temple 3d," has proven herself a very remarkable animal. Her milk yield for four months, in 1874, averaged 25⅛ qts.; greatest yield, 30⅝ qts.; least yield, 20⅛ qts. She has not only proven herself a remarkable cow by the quantity of her milk yield, but by her capability of giving milk almost constantly, and under such circumstances as would exclude 999 cows out of every 1,000 from giving milk at all. For instance, she dropped her last calf in the spring of 1875, and gave milk until near the spring of 1876; she then went dry two months (her owner supposing her to be with calf). Not proving to be with calf, she was milked again (after having gone dry two months), and yielded, that season, 14 qts. per day, and was again dried in the spring of 1877, and went dry three months. Once more, not proving to be with calf, she was milked again in the summer of 1877, and is now giving a good, fair daily yield of milk. I went to see her Dec. 22d, ult. She is owned in Providence, R. I. I could give you many other astonishing facts of the yield of this breed of cows; but doubt if any of the many readers of the Rural ever heard of a cow quite as remarkable as "Flora Temple 3d."

I am frequently asked the question:

"WHAT IS A GOOD AYRSHIRE COW WORTH?"

I consider them worth all the way from $100 to $500, much depending on their breeding, style, beauty and milk-producing capacities. I should never care to own one worth less than the former price, and it is the light of my ambition to breed and sell a cow for the latter sum. I intend to do it yet, and have my customer feel proud of his purchase. I believe there are cows of this breed which would be cheap at that sum. For the cheese-dairy districts of Ayrshire, Scotland, there is no breed of cattle that, for the amount of food consumed, can begin to compete with them; and they are held in such high estimation that, at a recent fair and cattle show, the entries of thorough-bred Ayrshire cattle were 478; of all other breeds, 31 animals. This exhibition was the 42d Annual Spring Show of the Ayrshire Agricultural Association. My own experience in breeding and keeping these cattle proves them to be both hardy and thrifty, and much more easily kept in good condition than most other breeds. They stand our long, cold New England winters as well as *any*, and better than *many* other breeds.

The only objection to this breed of dairy cows, here, seems to be that many of the imported animals have too short teats. The apparent cause of this is that in Scotland, where women and girls do all the milking, cows of this kind seem to be preferred; but here, in New England, where hard-fisted and large-handed farmers do the milking, these fine teats become a serious objection, and one which our breeders will endeavor to obviate. I am breeding for good teats as well as for good escutcheons and milk-veins. My rule for breeding this most valuable dairy animal is, breed for *constitution, milk* and *beauty*.

Putnam, Conn.

REMEDIES FOR VERMIN ON CATTLE.

Some one makes an inquiry, in the Rural, for a remedy for lice on cattle. Many years ago mine were troubled exceedingly. They were covered with lice. I used a great many remedies—washed them in tobacco water, which was disagreeable to apply, and did not do its work effectually. Oil and grease were also used, but not with satisfactory results. Mercurial ointment was effectual, but was dangerous, as I lost one or two animals by its use. About this time by the purchase of some animals, a fresh importation was made of blue lice, and something had to be done forthwith. I saw in some paper that ground plaster would kill them. We dusted it on the backs of the cattle and it killed about the whole of the pests. The plaster must be ground very fine, and be dry, or it will not destroy them. It is well to dry it in a pan, on the stove, before applying it.

When animals have been badly infested, lice will live a long time in the barn, and find their way on to any cattle which may be kept there. We whitewashed the inside of the cattle stalls and after a time got the barn clean. We had animals afterwards which we had purchased which were troubled with vermin. We treated them with carbolic suds. We bought the carbolic crystals which may be had at almost any drug store, and which should not cost more than eight or ten cents per ounce. One pound of common bar soap should be put in a dish with some water and melted down; then add one ounce of crystals, stirring well. This, when cold, makes a strong soap—cheaper and better than we are able to buy. A strong suds made with it is sure death to all insects which infest our domestic animals, and is safe and pleasant to use. It is also a good remedy for all skin diseases, and a good application to cleanse any wound or sore. A wash of the suds will benefit any animal which is hide-bound or out of condition; it is a cheap, useful, and effectual remedy for many things, and should be kept on every

farm. In killing lice, two or three applications are necessary as the nits keep hatching. Many fail by not observing this; it is a mistake to suppose that fat cattle do not have them, but no animals can long remain in good condition where they are abundant. People who are negligent in the care of their animals, will not discover and exterminate the pests until their animals are overrun with them. Those who card their cattle daily are seldom much troubled with them. It is a mistake to suppose that filth will generate them, as many suppose. There must be life to beget life. With a little care, and the free use of carbolic suds, no one need be troubled with them long. Where the barn is once clean, by a little watching we may easily keep clear of them.

Hampton Falls, N. H. W. BROWN.

OIL-CAKE.

THIS extraordinarily fattening food has been going from the United States to England in great quantities, but now that beef and mutton are being sent and are becoming a regular trade, and it is found that none but the best fed meat pays for sending, it would seem altogether wrong for the farmers of this country to allow the English to keep on feeding their cattle and sheep with what ought to be used here to make the first quality of meat for exportation, and at the same time to enrich the soil by the valuable manure always following the use of oil-cake.

More especially is it surprising when it is so well understood that roots cannot be profitably grown as well in America as in England, because of the greater heat and less moisture in summer and the much severer cold in winter; on this account anyone would suppose that oil-cake would be much more valuable here than in England and also because it is very desirable on account of its counteracting the evil effects of coarse, dried-up hay.

Orange County dairy farmers purchase much food to force milk and enable them to send to New York City a certain quantity regularly all winter, and doubtless it would pay them well to use this exceedingly luscious food.

A few years ago I superintended a large dairy establishment near Baltimore. On commencing, I bought bran and fed, dry, between the times slop was given, and I raised the quantity of milk above one hundred gallons per day in three weeks, without any extra cows. The cost of bran was not felt, as we put less corn-meal in the slop, but just at this time we purchased some oil-cake meal and boiled it up in the slop with the rest of the feed and there was another rise of about thirty gallons, and from all the best customers we had expressions of pleasure and satisfaction at the beautiful quality of the milk. I used oil-cake freely in England many years ago, but it is right to add that on one occasion I fed a good deal when making butter, and although it did not hurt the milk, the butter was certainly unpleasantly affected, but nevertheless increased nearly thirty per cent. in quantity.

I have not the slightest doubt but that, if fed in moderate quantity to Orange County cows, it would pay well as regards the sale of milk, and would also enrich the manure, and thereby add to the production of grass so much as to enable those feeding it to keep twenty-five per cent. more cows. There is a gentleman now in the county who has been trying it on some cows and steers, and a man who did not know what feed was being given to them, on seeing them two weeks afterwards, exclaimed that he had not seen such an improvement in cattle in so short a time while he had been in the country. Try some by mixing small quantities first, and the results will astonish every one not accustomed to witness its effects. GEORGE GARDNER.

VENTILATION OF STABLES.

ALL considerate individuals are aware of the importance of pure, sweet air in the economy of health to the human family. Of equal importance is it to the well doing of our dumb animals, horses cows, etc.; but how many farmers seem to disregard this requirement! Many, otherwise excellent barns and stables, are faulty in this particular of ventilation. How to so arrange for perfect ventilation of our stables for cattle and horses, so that they may at the same time be protected from cold drafts of air, chills, etc., I confess myself not qualified to advise; but that with our present knowledge better ventilation may be had than is provided by a large proportion of farmers, there is unquestionably no denying. That individuals and cattle may endure and live in the stable atmosphere of farmers' barns is true; but can they live in health? In the majority of stables one cannot pass through without carrying the ammoniacal gases in his clothes for some time, even in the open air. This ought not so to be. What an atmosphere to milk cows in! but how frequently is it thoughtlessly done; although milk is exceedingly sensitive to all odors. Is there any wonder that so much poor butter and milk find their way to market, when we consider the stables and atmosphere which the cows are shut up in, to say nothing of other kinds of uncleanness which often affect the milk while being drawn.

No stable should be built without some duct through which foul air may be conveyed away; one, two, or more, according to the size of stable, should ascend from the top of the stable and pass out through the roof. Foul and heated air ascends, and the draft encouraged by the duct, will tend to clear the air of the stable; sufficient fresh air will find its way in through cracks, and over the heads of the animals from in front, to keep ventilation tolerably good, much better than where no ducts are provided. Milk producers become so habituated to this stable atmosphere that they are not aware of the amount of ammonia which they constantly carry about in their clothes, but notwithstanding this, it is none the less sufficient oftentimes to taint a good-sized room of pure air. With free ventilation this would be very much less frequent. W. H. WHITE.

MAINE Dairymen's Association's fourth annual meeting will be held with South Paris Dairying Association, South Paris, February 12th and 14th in Andrew's Hall. This meeting promises to be one of unusual interest.—J. W. LANG, Secretary.

The Poultry Yard.

POULTRY ACCOUNT.

LAST year I sent you my "Poultry Account." (See RURAL of April 7, 1877.) I think it must have been of some interest to those concerned in the care and profit of fowls. I saw the account copied in several papers; also received a large number of letters from RURAL readers, asking me to state how my fowls were housed, fed and cared for. All letters I cheerfully answered, giving full particulars of my way of managing my flock. I am quite sure, therefore, that some RURAL friends would like to hear of my success or failure during the year just closed.

The following account has been very carefully kept, and may be relied on as a truthful statement. My chickens were hatched during the month of May. Last year, as stated, my fowls were nearly pure-blood Dominiques; this year, I raised fifty Brahma and Cochin pullets, also a few Plymouth Rocks. The Dominiques commenced laying the last of September; one Brahma Dec. 22d. No eggs from the Cochins or Plymouth Rocks. At this date I am getting sixty to seventy eggs daily. From my experience, I still think the Dominique the most desirable fowl for the farm-yard.

IN ACCOUNT WITH 144 FOWLS.

Jan. 1, 1877.	*Dr.*
To 144 fowls, at 50 cts. each	$ 72 00
2 tons wheat screenings, at $27	54 00
1 ton cracked corn	26 00
½ ton wheat middlings	13 50
15 bushels oats, at 40 cts	6 00
10 bushels rye, at 70 cts	7 00
90 bushels shelled corn, at 60 cts	54 00
Meat scrap, &c	3 20
50 doz. eggs set, at 18 cts	9 00
Total cost	$244 70
Dec. 31, 1877.	*Cr*
By 1,070½ dozen eggs	$253 97
74 hens sold, April 10th	51 45
139 roosters sold, July and August	52 34
59 pullets sold, Nov. 1st, at 60 cts	35 40
27 pullets sold, Dec. 28, at 75 cts	20 25
174 stock on hand, at 60 cts	104 40
36 bbls. hen manure, at $1	36 00
Total proceeds	$582 81
Deduct cost	244 70
Profit	$338 11

The eggs were sold to grocery stores for cash; the range of prices was from 15 to 40 cts. per dozen; 74 hens were sold April 10th to 15th, prices at that time being unusually high—20 cts. a pound, dressed. By reading and following the advice of your excellent correspondent, Mr. H. HALES, I have kept my fowls in good, healthy condition. WM. C. HART.

Walden, N. Y., Jan. 14, 1878.

POULTRY HINTS.

THE last month having been one of extraordinary mildness, much of the advice given for January still holds good for February. The absence of snow, and extreme cold have given poultry a favorable chance for health, and laying birds that have had a range, have had the benefit of fine, young grass in most localities. After such weather as we have had, we must expect some more like winter, that coming on suddenly, will necessitate extra care on the part of the keepers of poultry; for sudden cold checks their laying. To remedy this, give a little more stimulating food, and see that their quarters are warm at night. With these precautions, a cold snap can be bridged over without much loss Do not forget more vegetable food than usually given, is required when the ground is covered with snow. H. H.

Miscellaneous.

THE PRINCIPLES OF SEED PLANTING.

S. RUFUS MASON.

THERE are two facts connected with this subject which must be considered: bad seeds are plentiful enough, but bad planters are entirely too numerous. The best of seeds, in the hands of a poor gardener, are nearly worthless, and it is to remove this last difficulty that I write this article. I hope to make every one who reads this a competent judge of good or bad seeds, and then it is very probable their own judgment will fall upon their own defenceless heads.

Seeds may be likened to the human race, as they are of every possible variety and disposition, and for their perfect development to maturity they require as diverse treatment as a lot of school children. There are seeds of a soft, tender shell, hard, leathery shell, and almost a stony shell; some, natives of hot and dry, hot and moist, cold and moist, of temperate and even of frigid atmospheres and soils. When we consider that we have all this variety of nativities to bring to perfection in our single soil and climate, we cannot help feeling that we have a lot of foreigners to raise from infancy in an entirely new country. This fact should induce us to plant them in such soil and at such a time, in our planting season, as will best suit their several dispositions.

On the other hand, their sizes and consequent strength must be considered. A large, robust seed can, even if planted deeply, force its way up through heavy soil, while a small one would perish in the effort. Seeds from warm countries cannot grow, if put into the ground in the cold part of the spring, nor can those from cold regions thrive, if sown late and exposed to too high a temperature while young and tender. Seeds with a thick, hard shell or skin must have time in the ground to allow the natural moisture to soften it, and allow the tender germ to make its way out. In fact, treat the different kinds as you would so many infants—the tender ones tenderly, and the robust ones according to their strength.

Now, as to the depth to plant: The old rule, "to plant only as deep as the size of the seed," is entirely wrong, and while, in a carefully managed green-house, it might be adhered to, it is perfect folly in the open air. Warmth, moisture and protection from strong light are necessary for all seeds; but the amount of the two first, as I have intimated above, varies vastly with the kind of seed. Not only must the condition of soil and temperature at the time of planting be well considered, but their probable fitness, as the season advances, must also be taken into account. If every demand be fully met at seed sowing, but the soil be likely to become, by its natural position and the natural changes of the season, too dry or too wet, these difficulties must be provided against, or failure is certain. Merely causing a seed to germinate is nothing, if its after condition is to be adverse to its healthy growth. Planting too early produces a weakly plant, and at an improper season, and if planted too late the same difficulty attends it. In the first case cold, and in the last heat, will check its growth.

This is the time of year for serious thought upon the spring business of the farm and garden, and a careful digest of the above ideas will prepare one for a later article, in which will be given practical directions for insuring success, in the hope that bad planters will not be as numerous as bad seeds in the future.

GARDEN EXPERIMENTS.

MR. CRANE, in the RURAL of Jan. 5th, notices that the Early Rose potato is running out, and as that variety is yearly improving here, so as now to be used as a winter sort, as well as a very early one, I think I can tell him how to restore its value on his farm. Our soil is a black, sandy alluvial, very rich in undecomposed vegetable matter, varying from two and one-half to four feet deep, resting on a sand-bed of unknown depth—not less than a hundred and fifty feet. It is also fully impregnated, evenly through, with potash. Nine years ago, when the Early Rose was a new thing, it was the best summer and the worst fall and winter potato known here. Constant cultivation, early digging, close covering in hills in the field till frost, and careful housing in "pits not warm enough to sprout them," about the early part of November, have almost entirely changed their character as keepers. The moment a potato sprouts it is unfit for food; but if Mr. CRANE will use potash as a fertilizer, he will, no doubt, still plant the Early Rose. I have a higher price offered for mine than the regular market rates, merely because I dig, shelter and house them so as to maintain their good qualities. Hubbard's Curled-leaf tomato is our earliest kind, and a heavy cropper. This, I believe, is as much due to our potash as to anything else. All the soil east of the Alleghany Mountains suffers from lack of potash; it *never* had as much as that west of the Mississippi, and the constant drain of two hundred years has totally depleted it. The remedy suggests itself.

Dodge Co., Wis.

WESTERN ECHOES FROM THE "MAPLE SHADOWS."

DR. A. C. WILLIAMS.

"HARD TIMES."

ALL classes in general, and the farmers of Central Illinois, in particular, are passing through the gloomiest, darkest monetary crisis that this section has ever experienced since the country was settled, 50 years ago. Time was here, when the man who went into bankruptcy was only to be heard of, not seen. He resided far away in some other vicinity, was no neighbor, and was regarded as a visionary monument of misfortune, or monster of villainy; but now he has a real existence, and is just as likely to be yourself or neighbor, as he is to be somebody else's neighbor. Our local papers chronicle, each week, bankruptcies and assignments that, like mighty earthquakes, are shaking up the country from centre to circumference, and neighborhood after neighborhood, hamlet, village and town, are being drawn into the widening vortex, while the great weeklies and dailies come from the large cities and capitals loaded with new shocks which run over the country like tidal waves, frequently wrecking the fortunes of citizens, shippers, and bankers of our rural districts, until it looks as if sooner or later, we must all be drawn into the eddy, as it were, of the great financial maelstrom. Yet, as I have before said, there is a large portion of the hard times here, the natural and legitimate results of our own extravagance and imprudence.

A DANGER TO PEACHES.

Owing to the changeable weather we are getting this winter, peaches will evidently never get through it alive. Buds will push sufficiently, I fear, during some of the warm days, to be killed by the following frosts. My trees which I laid down and covered up with earth and straw, are apparently enjoying good health; and even if they should do nothing else, I shall feel amply repaid by the questions I have been asked to answer concerning them.

A GOOD SUGGESTION.

I have been wondering of late if the managers or editors of the RURAL could devise some plan by which its subscribers could, another year, be brought into competition with each other, in growing or producing large yields of corn, roots, and large vegetables. It would matter but little if the intrinsic value of the premiums or prizes were but nominal, as the rivalry in such matters generally consists in striving for the highest success. Each competitor would be benefited by the impulse for better farming one naturally feels when he knows he is being brought into competition with his neighbors. Moreover, if one fails to secure the prize, his work is not lost; for his condition will be even better than if he had not participated, since he is likely to have better yields from the soil under such efforts as he would make. I am confident there are those among the readers of the RURAL, blessed with fortune, who would offer small prizes, themselves, just to advance the interests of agricultural pursuits. If it did not look so personal, I could name now several prominent gentlemen, well-known to RURAL readers, and whose names grace its pages frequently, who would be almost certain to offer reasonable prizes to further the project.

Douglas Co., Illinois.

FRUIT IN WESTERN N. Y.

THE following item of interest was crowded out of our report of the Western N. Y. Horticultural Society last week:

Despite partial failures of the apple and pear crops, the fruit of Western New York the past year is a leading item in its salable products. Erie county sold of apples alone upwards of $1,000,000 worth, and of pears and quinces and small fruits, half as much more. Some statistics as to the products of individual orchards for a series of years show that even apples when well cared for are a fair source of income during these hard times. Two orchards in Orleans County, indicate what may be done. Wm. Wood & Son, in the town of Carlton, set twenty-five beds of apple trees in 1860 including 1250 trees of which 600 were Baldwin, 400 Roxbury Russet, and the balance Greening and other productive varieties. From this orchard the sales since 1871 have been as follows:

Year	barrels	value
1873	300	$1 000
1873	445	3 300
1874	968	2 662
1875	1,100	3,300
1876	800	1 680
1877	1,000	3,000

It will be noticed that this orchard bears most in the odd years when apples are scarce and dear, which materially helps the goodly column of figures which tell the product of the crop.

THE
RURAL NEW-YORKER.

PUBLISHED EVERY SATURDAY.

Address
RURAL PUBLISHING CO.,
178 Duane Street New York City.

SATURDAY, FEBRUARY 9, 1878.

We earnestly request that all letters containing money, or any communication intended for the BUSINESS DEPARTMENT *of the paper, be addressed to the Editor, the Publisher, or* THE RURAL NEW-YORKER, *and not to any individual. We cannot otherwise guarantee the prompt entry of names upon our books, or the acknowledgment of money.*

PROF. I. P. ROBERTS' series upon Agriculture and Education is continued in this number.

A NUMBER of our subscribers have written us that they have seeds of the Shell Flower (Moluccella lævis) raised from the seeds which we sent them. We would feel obliged to such subscribers if they would state the quantities they have, and the prices at which they may be purchased.

THE TEMPERANCE MOVEMENT.

OF intoxicating liquors three hundred and fifty million gallons, or thirty-six quarts for every man, woman and child in the country, are annually legitimately made in the United States. The cost of manufacturing this enormous quantity of deleterious drink, amounts to six hundred million dollars, or fifteen dollars to each individual, from the venerable grandmother in the arm-chair to the new-born babe in the cradle. Our importations of foreign wines and other spirituous as well as malt liquors, costs about one-sixth as much as the domestic manufacture of those articles. Moreover, this vast ocean of liquor is constantly receiving no inconsiderable surreptitious contributions from innumerable illicit distilleries scattered throughout the country, and also from adulterations of various kinds, nearly all of which add greatly to the pernicious character inherent in the article. The retail price at which the stuff is distributed to the consumers, swells to gigantic proportions, the aggregate amount of money drawn in this way from the pockets of the people to tickle their palates or satisfy a morbid craving.

Taking into account the women, children, and male teetotalers of the country, it is fair to estimate that at least one-half its population never contribute a dollar towards this sum. Of the remainder, half, at least, do so very rarely, and fully recognizing the lamentable amount of evil due to the use of intoxicating liquors, would be rejoiced to see their sale either entirely prohibited or greatly limited. Nearly all the outlay on this account comes from not more than one-fourth of our entire population, and the vast bulk of it from a number considerably less than half of these. From the class thus prepared, statistics show that nearly three-fourths of the inmates of our prisons, lunatic asylums and alms-houses are composed; and in nearly all cases, their consignment to these abodes of guilt, misery and wretchedness, was but the culmination of a career in which frequent intoxication and the brutality, selfishness, improvidence and violence, which are its natural consequences, had brought misery on thousands of innocent heads. Indeed, one of the worst features of drunkenness is that while the enjoyment, beastly as it may be, is exclusively confined to the drunkard himself, the misery inseparable from it, falls most grievously on others.

There are some evils of such a nature, that the most powerful argument against them consists in a simple statistical statement of the most flagrant of their results. Of these, intemperance is probably the most forcible example, for no sober, thoughtful man can ponder on its indisputable effects, on the certain degradation, ultimate misery and poverty, as well as probable crime of its victim, and the wretchedness it inevitably entails on all connected with him, without detesting the vice and resolving to do all in his power to check its ravages. It is this consideration that is the chief motive-power with the zealous advocates of temperance and teetotalism now vigorously exerting themselves in different parts of the country, and all earnest men—and especially all women, for they, alas! are the chief sufferers by intoxication—will rejoice at the eminent success that is rewarding the labors of these apostles of temperance. Nor should they confine their sympathy with the movement merely to good wishes, but they should, each in his or her own sphere, bring their best influence to bear upon all addicted to this ruinous practice.

It should, however, be borne strongly in mind that in this connection an ounce of prevention is worth a pound of cure; for while the permanent reformation of the veteran drunkard is only occasionally seen among the few miracles that are still at rare intervals, wrought among us, the reclamation of the incipient bibber and the preservation of the rising generation, is a task much more easy and fruitful. It is, however, a mistake common alike with the most enthusiastic missionaries to the heathen, and workers among drunkards, to labor more vigorously and rejoice more earnestly over the conversion of "hard cases" than over the reclamation of those only slightly erring, or the preservation of those still happy in their innocence. Just as the zealous missionary feels amply rewarded by the partial conversion of a few ignorant savages, for an outlay of labor, risk and money that would have converted as many dozens of his ignorant neighbors at home, so does the apostle of temperance rejoice more over the doubtful reformation of a carbuncled toper than over the assured conversion of a dozen moderate drinkers whose noses even have not yet begun to blush. But, although we may differ a trifle from some of these gentlemen both in our opinions of the best methods of conducting the work and in selecting the special objects to be benefited by it, we cannot withhold our hearty commendation of their labors nor an expression of satisfaction at the ample measure of success which is rewarding their beneficient efforts.

AGITATION!

THE constant ebb and flow of the tides serve to keep in motion the waters of the sea, which would otherwise become stagnant, and cause the death of every living creature. The constant motion of the air renders it in fit condition for the lungs of man and animals—and we may add plants; for plants have lungs as truly as we have, and a stagnant air affects them as surely as it does man. Constant stirring of the ground is well known to be of great service in putting it in condition to absorb and retain fertilizing properties from the atmosphere. This is the case in some soils to such an extent, that it is said a second plowing is equal to a coating of manure, a statement which should doubtless be taken with a good many grains of allowance.

As in the physical world, so in the moral and intellectual. Is there an unjust law on our statute books? The best way to treat it is to show it up to the people. Let the community once get talking about it, and the wrong will soon become apparent. While we take no part in the recent discussions of the theological world relative to the question of the extent and duration of a future punishment—which discussion seems likely to spread throughout Christendom—we rejoice that they have arisen and trust they will be continued, only hoping they will be conducted in a Christian spirit and with brotherly love. Such discussion can do no possible harm. If it be true that the doctrines as taught by the greater portion of Christian teachers have not a foundation in fact, the sooner we know it the better for us. But if investigation shall show that the views held by the smaller number are without warrant—either of Scripture or reason—it will be well for them that they be shown their error and led into the right path. The inevitable result of this comparison of conflicting ideas, will be to induce many to enter upon a more thorough study of the subject, and to determine if they have really a belief, the result of examination, investigation, thought, and judgment; or if, while thinking they believe, they have been merely assenting to such views as others have asserted are correct.

It is certain, that few know what they really believe on these questions—or, in fact, on any other—or have a clear idea of what belief is. We may be pardoned if, in this connection, we reprint from the RURAL for July 22, 1876, brief definitions of certain words too often used synonymously:

"ASSENT is the admission of the truth of a statement or proposition without subjecting it to any proof, either of further evidence, reason, or experiment.

"BELIEF is confidence in the truth of a statement or proposition, after having examined the evidence so far as possible by the aid of Reason.

"KNOWLEDGE. When we have the testimony of our senses, used in conjunction with our reason, to attest the truth of evidence supporting a statement or proposition, we may be said to know it.

"FAITH is the conviction of the truth of a statement or proposition of which from our nature, it is impossible for us to attain knowledge or to logically prove or disprove—as faith in the absolute; in the ultimate first cause of all things; in GOD."

We rejoice, then, at the agitation of all questions in which the whole community are interested. In this way, error will be found and sophistry exposed, and the absurdity of reasoning founded on false premises, which has the show of truth to the illogical mind, will be plainly shown. None need fear the result.

"Ever the right comes uppermost,
And ever is justice done."

THE INJUSTICE OF IT.

"ORDER your shrubs and trees only of nurserymen of established reputations." One sees this advice repeated year after year—month after month, in horticultural and agricultural journals until it is not to be wondered at that it is next to an impossibility for a young man to succeed in the nursery business, no matter how competent he may be; no matter if he is twice as enterprising and fully as trustworthy as those of long "established reputations."

Everybody should know by this time that there are people who, every year, flit about the country with exaggerated pictures, jars of captivating fruits and printed descriptions which if not entirely false, so misrepresent the article with which orders are to be filled, as to disappoint or disgust the purchasers. If everybody doesn't know it, it is because he doesn't read, or is so great a dunce that he reads without being the wiser for it.

The motive of horticultural journals in seeking to protect their readers or the community against "swindling tree peddlers" need not be impugned. We desire simply to make it appear that their advice is, in many cases, working far more injury than good. By it, country people and all intending purchasers are warned against *all* traveling agents representing unknown concerns. "Are you responsible?" is now the first question which presents itself in the mind of him who desires to make out an order, let the agent seem ever so worthy of confidence—let him come as amply accredited as he may. For this reason a nurseryman who is seeking to establish a business, is placed at a great disadvantage. He is absolutely obliged to depend upon the trade of the locality or spend a small fortune in the semi-annual issue of thousands of free catalogues, and advertising in suitable mediums. Business of almost every kind is more and more from year to year being carried on by traveling agents, and if only those of well-known establishments are patronized, a very unpromising field is opened to those who have just begun the business or who intend to do so.

Swindling is by no means confined to traveling tree agents, though in times past the credulity of people who could be talked into paying exhorbitant prices for pear trees that would bear immense fruit the first year and ever after, and like absurdities, offered peculiar inducements to the cupidity of glib-tongued rogues. But such credulity is at the present time so hard to find that the horticultural press need no longer exercise itself as to their protection especially if, in order to do so, the entire tree-purchasing community must be cautioned against *all* agents who have no "established reputation."

If a person is induced to order of agents of whom he knows nothing, because the price is less or for any other reason, he has only to stipulate that the trees shall not be paid for until they have been opened and examined. There are those in almost every neighborhood who can determine a Bartlett or Seckel Pear tree—a T. Co. King or Baldwin at sight, or who, if the varieties are less common, can judge from the general appearance of the trees, the condition of the roots, the freshness of the bark; the manner of packing and labeling, whether a cheat is attempted or not.

Though, for the most part, we have dealt with firms of "established reputations," we have not always found the fruit or flower true to name. These were mistakes, for "mistakes may happen in the best regulated families." But had we purchased of traveling agents, they would have been frauds, for mistakes are not permissible to firms that have no "established reputations."

BREVITIES.

WHAT hardy ever green tree is the greenest at this season?

THE farmer's problem? How to find out what his crops need that the soil does not furnish. It looks easy enough doesn't it?

WE have all the while inquiries as to how to construct cheap ice-houses. Mr. MINER answers the question in rather a novel way on p. 86.

THE thermometer stood six degrees below zero at the Rural Grounds, February 4, being the lowest temperature this winter. Sleighing good.

WE call attention to Rev. R. H. CRANE'S Exchange offer (under Horticulture) only to say that we have reason to believe him a trustworthy gentleman.

"Ten years ago a Newburyport girl broke off a needle in her right foot, and a week ago, last Sunday, it worked out of the little finger of her left hand." To make an astounding coincidence a needle should break off in a boy's left hand and work out of the big toe of his right foot.

EVERY child over six years of age, whenever it is possible, should have a little garden of his or her own—if only three feet square. Go to the woods, children—to the fields in early spring (two months hence) and gather the plants if you cannot get them in any other way. Learn their familiar names first; then, by referring to any work on botany, the botanical names can be learnt. It is a good way to begin the study of botany, and it is a good way to lay the corner-stone of a useful and a happy life.

Literary Miscellany.

THE TWO SUITORS.

ONE sends a lily, cold and white—
White, with a heart of gold;
And one a bud, not open quite,
Whose pale lips just unfold
To whisper—hush, I know, dear rose!
Not yet, not yet, your lips unclose!

One says, "O, lady, wear to-night
This lily for my sake;
And let me read this sign aright,
A fairer flower to take!"
The other—hush, I know, dear rose!
Not yet, not yet, thy lips unclose!

Lily, I hate you—proud and grand,
Death, with a heart of gold!
Rose, dear rose, do you understand
To tell what you are told?
A word—a kiss—to-night, dear rose,
To-night to *him* your lips unclose!

[*Detroit Free Press.*

OLD TINKER—A STUDY.

M. E. S.

IT stood just across the road from the church, the little one-story red building, with its creaking, rheumatic old sign flapping in the wind. But, bless your heart! everybody in the village knew the place as well as they did their own homes, and the sign, with "SILAS TINKER, Boot and Shoe-maker" painted on it might as well have been in Jericho, for all the good it did.

"SILAS TINKER," indeed! It ought to have been "Old TINKER," for that was what everybody called him. I think he, himself, would have started if any one had addressed him as "SILAS TINKER," but Old TINKER was as familiar to him as his awl and last.

He was a dried-up, wrinkled, white-headed old curmudgeon without the heart of a mite. The milk of human kindness had soured long ago as far as he was concerned; there were always a hideous frown on his face, and a snap and a snarl on the end of his tongue. His nose was long and pointed, his mouth puckered, and his eyes about the size of beans. But they were evil little eyes! and they could dart such spiteful glints! Grown people shunned him, and children would as soon enter a red-hot furnace as Old TINKER'S shop. The very dogs took to their heels when they saw him coming and, it is said, a pet cat by some mischance wandering into his shop, went howling out and was never seen more.

Everyday was alike to Old TINKER. He did not know the meaning of a holiday. Sundays, when the villagers met at the little church to worship, they could look through the open windows and see him sitting at his bench hammering away for dear life, and looking sourer than ever. The good parson had remonstrated with him but all to no purpose. He was not to be moved from the even tenor of his way. Still, one thing was universally conceded, no one could make such boots and shoes as he. No one could put on a patch as neatly as Old TINKER; he had a faculty for mending the most dilapidated brogans until they looked as good as new. He lived on nothing a day, as the grocer could well testify. His house consisted of the one room with a bed in a recess; a table, a wooden chair and his bench, not forgetting a queer old dutch clock.

The church fund didn't trouble Old TINKER; his name was never seen at the head or tail of a subscription list. He never contributed to the foreign mission, in fact he was never known to be liberal but once, and that happened when a beggar, asking him for a penny, received his "awl" instead!

To speak truth, he was a heathen, and needed a missionary to reform him as badly as any of the South Sea Islanders. Such an one came at last, and in a strange manner.

JACK TRAVERS was considered the scape-goat of the town. He was the son of a drunken father, and a hard-working mother. I say "scape-goat"—not that there was anything so very bad about him, only a superabundance of fun; for, although he was always ready for a joke, he was just as ready to help or sympathize with any one in trouble. Girls and small boys liked him because, as he used to say, he "Wouldn't see 'em bullied." Poor JACK didn't wear very good clothes. He was always out at the elbows and knees, and his feet were oftenor bare than shod. These trifling inconveniences, however, never troubled him—not a bit of it! He was one of those happy fellows who make their own sunshine as they go along.

His way to school lay past "Old TINKER'S" shop, and one morning, his hands in his pockets, whistling along, he happened to glance in. There sat the old heathen, his face in a thousand wrinkles, his mouth puckered to one side, and the meanest little look in his bean eyes. JACK was seized suddenly with a fit of daring. Thrusting his head in at the door, he shouted, "How ugly you look, 'Old TINKER!'"

Instantly the awl came flying through the air, and the boy took to his heels with all speed.

Cursing the ill luck of it, "Old TINKER" picked up the unreasonable tool and resumed his work. But somehow he couldn't forget the words, "How ugly you look, 'Old TINKER!'" They troubled him. Everything seemed repeating them. Every peg he drove, the hammer kept saying, "How ugly you look, 'Old TINKER!'" The clock ticked out regularly, "How ugly you look, 'Old TINKER!'" when the bell rang for prayer-meeting, it rang out, "How ugly you look, 'Old TINKER!'" He couldn't even walk across the room without his shoes squeaking the same refrain.

It was aggravating—it was downright mean. He went to bed an hour earlier that night, first stuffing his ears full of cotton, so that he might not hear the clock. As soon as he fell asleep, great goblins peeped from behind his bed-posts, perched on the foot-board, and at last filled the room. They shook their heads, and pointing their long, skinny fingers at him, laughed, cackled, and screamed, "How ugly you look, 'Old TINKER! Oh, how ugly you look!"

The next day it was no better, nor the next. He didn't dare sleep o' nights, for fear of the goblins, who made it even worse for him than in the day-time. He began to neglect his work and lose his customers. The Parson found that the patch on one of his Sunday boots was so poorly put on, that it dropped off the first time he wore it; people complained that his shoes weren't half pegged, and that the leather cracked. "Old TINKER" lost ground so fast, that presently he was compelled to sit astride his bench, idle, and listen to that dreadful clock.

One day, when he could stand it no longer, he tore off the honest old Dutch face, and hammered the machinery to pieces. "There!" he exclaimed, "I shall have a little peace now." But no; he was mistaken. Very soon he heard a chirping sound near the fire-place. It was only a little black cricket, but it said as plainly as possible, "How ugly you look, 'Old TINKER!'" He rushed for it with the poker, but it skipped down a crack out of sight, and chirped louder than ever. At last, completely disheartened, and almost ready to give up, he fell asleep on his bench and dreamed a curious dream. When he awoke, he went to work with a will, and a customer coming in that afternoon, was astonished by his asking, "How many children Mrs. TRAVERS had?"

One night, several weeks after this occurrence, JACK was returning from school, with his face somewhat downcast. He was thinking how much he and his brothers and sisters needed new shoes, and how unlikely they were to get any. His father was drinking very hard and the family were poorer than ever. As he came opposite the shop, Old TINKER was standing in the door. JACK thought of the awl and was going to shy across the street, when the old man called to him.

"What do you want of me?" asked JACK, drawing back.

"I've got something for you," he answered.

"A flogging," quoth JACK to himself, "I'll bet my life;" and adding aloud, "I'm just as much obliged to you, and I hope you won't take it hard if I refuse."

"Come, now, don't be afraid. I don't wish you any harm. See," and he held a large package toward the boy. "You can have this on one condition."

"What's that?" asked JACK, his curiosity somewhat aroused.

"That you'll never say again, as long as you live, 'How ugly you look, Old TINKER.'"

"Well," replied JACK, giving a prolonged whistle, "I can promise that easily enough, if it's all you want; but I can just tell you, if I'm to have that 'ere bundle, you'll have to lay it down on the walk, and go into the shop and shut the door tight 'fore I'll come after it; for I can't get over the feeling you mean gammon on a fellar."

To his great surprise, Old TINKER did as he was bidden, and, snatching the parcel, JACK made his way home. Upon opening the package, he found that which caused him to stare in open-eyed wonder, and the rest of the family too, for that matter. It did seem incredible, but it proved a fact. Old TINKER had opened his heart, and made a present of a pair of shoes to every one of the children. Mrs. TRAVERS was not forgotten, either.

Now, as I have said before, JACK possessed a soft heart. He felt very grateful for this unlooked-for gift, and wanted to thank Old TINKER very much. But what to say, or how to accomplish it, was more than he could conjecture. He remained awake that night, thinking about the matter, forming all manner of plans, and all to no purpose. One thing was certain: he didn't wish to get very near the old man, for sundry good reasons. Eventually a happy thought seemed to strike him, and he was soon sleeping lustily.

The next morning, when he came near the shop, the door was standing half open. He felt a queer flutter about his heart, but, putting a bold face on, he hurriedly thrust his face in and shouted, at the top of his voice, "GOD bless you, Old TINKER!"

The old man started, dropping his awl upon the floor, and stared with amazement after the retreating figure. "I declare," he muttered, "that youngster gave me a queer start. What could he mean?" Soon he heard a chirping sound, and looking down, there sat the black cricket close beside him, saying "God bless you Old TINKER." He didn't start for the poker this time, but sat perfectly still gazing at the insect in a bewildered way. By and by he picked up his hammer and drove a peg. "God bless you Old TINKER" the strokes said. He got up and walked across the room—"God bless you Old TINKER," his shoes squeaked. He listened when the bell rang for prayer meeting, "God bless you Old TINKER" it rang. And, if you'll believe it, when he fell asleep that night, instead of the Goblins came troops of white robed angels who hovered around his bed and kept whispering "God bless you Old TINKER!"

Now, this was a very different tune from the other; and produced much better harmony as you well know who have had any experience in the matter. It didn't seem to distract him at all, for he worked better than ever and there wasn't half as many wrinkles in his face as formerly. In fact, he seemed to like it, for every once in a while he would catch himself repeating out loud "God bless you Old TINKER." After a while people began to notice a change for the better. A customer spread the wonderful news that "Old TINKER had smiled on him, and said good-morning." Then another thing they noticed the shop was closed on Sundays. The parson when he heard of it, determined to try his luck once again. So one day he happened in for the express purpose of engaging the old man in a little religious argument. Upon asking him "If he didn't consider his soul in a precarious condition," much to his surprise and delight he answered, "he did." The parson then proposed prayer. When he had finished, Old TINKER, with tears in his eyes, told his experience, at which the parson declared, very solemnly, it was the hand of the Lord, and Old TINKER replied very meekly, "he thought it was." He got him to promise that he would attend church next Sunday, and went away well satisfied.

Now I do not wish to condemn the good parson as an egotist, but this was such a remarkable case that he felt it his duty to go from house to house and inform the inhabitants "that he had converted Old TINKER, and that he was going to church."

The next Sabbath the meeting house was crowded to overflowing. The parson delivered a long-winded sermon, but he might as well have preached to the wind. His congregation were stretching their necks to catch a glimpse of a white-headed, wrinkled, old man on the front seat, who, after the sermon was over, arose and in a trembling voice, with the tears streaming down his cheeks, told just how it all happened.

JACK couldn't for the life of him, think why it was after this, that all the old women gave him caraway cookies and sprigs of fennel between the meeting hours; or why the old men patted him on the head and called him "a fine lad" so often. He wasn't used to it. Still, it didn't seem to disturb him much, for he kept right on shying snow-balls and fighting big boys until Old TINKER died.

HOW THE ENGLISH LANGUAGE IS MADE.

BY X. Y. Z.

STARTING from the recognized fact that the English is not a simple but a composite language, made up of several elements, it is a study of great interest to trace the words of different origin to their respective sources, and to note how and for what purposes they have come to form parts of the general amalgamation. As everybody knows, the basis of the language is Anglo-Saxon; which, moreover, is not only one of its separate elements, like the Latin or French, from which we derive considerable contributions, but rather the foundation or fundamental portion of the structure. Or, it might be called not improperly the backbone of the national speech, into which all the other parts are jointed, and on which they are dependent for their symmetry and adaptation to the ends they are called to serve. A perfect composition might be formed from Anglo-Saxon words alone, but no grammatical sentence could be constructed out of words that have been adopted from other languages. All the words we have derived from French or Latin are but additional materials of expression; they have not altered the original character of the native tongue, but have had to conform themselves to its particular laws and constitution. We must not, however, conclude that it is mere pedantry to adopt a foreign word, since, perhaps few if any, words have been incorporated into our language that were not necessary, or at least serviceable accessories. Still, it would appear that our entire acquisitions from foreign sources are merely an increase of words.

Some writers affect to admire and recommend what has been called a pure Saxon style, and somehow unduly deprecate the Latin and other foreign portions of the language, as though nothing significant were gained by them. Mr. Trench tells us that he remembers Lord Brougham urging upon the students at Glasgow, as a help to writing good English, that they should seek, as far as possible, to rid their diction of long-tailed words in 'osity' and 'ation.' Not a bad advice, perhaps, to the class of persons then addressed, as it is a known fault of young unpracticed writers to distend their composition, and to aim at an over-stately turn of sentences. No doubt, one part of the language ought not to be cultivated at the expense of the other; certainly not the Latin at the expense of the Saxon; for doubtless, every word derived from a foreign source which has become permanently incorporated with the language, was originally adopted, and has been retained in use, either because it answered some new need of expression, or afforded a convenient variety of phraseology obviating inelegant repetitions.

The earliest augmentation of the vocabulary by foreign words was evidently a consequence of the Norman Conquest. There was no immediate interpenetration of the Anglo-Saxon with any large amount of French words; for, in fact, the two streams of language flowed a long while apart, even as the two nations remained aloof, and were not amalgamated till after many years. Time, however, softens the mutual antipathy both of men and languages. The Norman, shut out from France, began more and more to feel that England was his home and sphere. The Saxon, recovering little by little from the extreme depression which had ensued on his defeat, became every day a more important element of the new English nation which was gradually forming from the coalition of the two races. His language partook of his elevation: it was no longer the badge of inferiority. French was no longer the only language in which a gentleman could speak, or in which a poet could sing. At the same time, the Saxon, now passing into the English language, required a vast addition to its vocabulary, if it were to serve all the needs of those who were willing to employ it now. How much was there of high culture, how many of the arts of life, of its refined pleasures, which had been strange to Saxon men, and had therefore found no utterance in Saxon words. All this it was thought to supply from the French.

The next great importation of foreign words was made from another quarter: it occurred shortly after the revival of learning in Italy; and from the time of the Reformation, and afterwards, it was largely followed up. There was a need of new words to express theological and metaphysical ideas—things pretty well unknown both to the Normans and Anglo-Saxons—and for this purpose a supply of Latin words was found to be essential.

The period during which this naturalization of Latin words in the English language was going forward, may be said to have continued for upwards of a century. It first received a check from the coming up of French tastes, fashions, and habits of thought, with the restoration of Charles II. The writers already formed before that period still continued to write their stately sentences, Latin in structure and Latin in diction, but not so those of a younger generation.

We may say of this influx of Latin, that it left the language immensely increased in copiousness, with greatly enlarged capabilities, but perhaps somewhat burdened, and not always able to move gracefully under the weight of its new acquisitions; for, as Dryden has somewhere truly said, it is easy enough to acquire foreign words, but to know what to do with them after you have acquired them, is the difficulty. It might have received, indeed, most serious injury if all the words which the great writers of this Latin period of our language employed, and so proposed as candidates for admission into it, had received the stamp of popular allowance.

As it happened, it was not so. It was here, as it had been before with the French importations; the reactive powers of the language, enabling it to throw off that which was foreign to it, did not fail to display themselves now, as they had done then. The number of unsuccessful candidates for admission into, and permanent naturalization in, the language during this period, is enormous; and one must say that in almost all instances where the alien act has been enforced, the sentence of exclusion was a just one; it was such as the circumstances of the case abundantly bore out.

Either the words were not idiomatic, or were not intelligible, or were not needed, or looked ill, or sounded ill, or some other valid reason existed against them. A lover of his native tongue will tremble to think what that tongue would have become, if all the vocables from the Latin and the Greek, which were then introduced or indorsed by illustrious names, had been admitted on the strength of their recommendation; if torve and tetric (Fuller), cecity (Hooker), tepid and sufflaminate (Barrow), stultiloquy, immorigerous, clancular, ferity, hyperaspist (all in Jeremy Taylor); if dyscolous (Fox), moliminously (Cudworth), immarcescible (Bishop Hall), arride (ridiculed by Ben Jonson); with the hundreds of others like these, and even more monstrous than some of these, not to speak of such Italian as leggiadrous (Beaumont, *Psyche*), had not been rejected. Among these words, we notice one, cecity, which Carlyle attempted to revive, though we cannot think it will ever be received into general use—blindness, which it signifies, is so much simpler, and every way equivalent, as to be incomparably better.

Many words, however, formerly deemed objectionable, have been adopted in a shape somewhat different from the one in which they were originally introduced. "They were made to drop their foreign termination—or otherwise their foreign appearance—to conform themselves to their ways, and only so were finally incorporated into the great family of English words. Thus, pantomimi (Lord Bacon) soon became pantomimes; atomi (Lord Brooke), atoms; epocha (Dryden) became epoch; caricatura (Sir T. Browne), caricature; effigies and statua (both in Shakspeare), effigy and statue; not otherwise pyramis and pyramides, which also are forms employed by him, became pyramid and pyramids; colone (Burton), clown; apostata (Massinger) became apostate; despota (Fox), despot; synonyma (Milton, prose), synonyms; galaxias (Fox), galaxy; and heros (H. More), hero. Nor can that slight but widely extended change of innocency, indolency, temperancy, and the large family of words with similar termination, into innocence, indolence, temperance, and the like, be regarded otherwise than as part of the same process.

The same has gone on with words from other languages, as from the Italian and the Spanish: thus bandito (Shakspeare) becomes bandit; princessa (Hacket), princess; scaramucha (Dryden), scaramouch; capriche becomes first caprich (Butler), then caprice; ambuscado, barricado, renegado, hurricano (all in Shakspeare), brocado (Hakluyt), drop their foreign terminations, and severally become ambuscade, barricade, renegade, hurricane, brocade. Other slight modifications of spelling, not in the termination but in the body of a word, will indicate, in like manner, its more entire incorporation into the English language. Thus, restoration was at first spelt restauration; and so long as vicinage was spelt voisinage, (as by Bishop Sanderson,) or mirror, mir-

ior, (as by Fuller), they could scarcely be said to be those purely English words which now they are.

These adaptations from the French and Latin are the two great enlargements which our vocabulary has received. All others are minor and subordinate. Thus the introduction of French tastes by Charles II. and his courtiers, returned from exile, rather modified the structure of our sentences than much increased our vocables. To this period we are nevertheless indebted for a certain number of new words. In Dryden's play of *Marriage a la Mode*, a lady full of affectat'on is introduced, who is always employing French idioms in preference to English—the design, of course, being to ridicule such affectation. On this Mr. Trench remarks:—"It is not a little curious that of these which are thus put into her mouth to render her ridiculous, not a few are now excellent English, and have nothing far-sought or affected about them; so often does it prove, that what was laughed at in the beginning, is by all admitted and allowed at the last. For example, to speak of a person being in the 'good graces' of another has nothing in it ridiculous now; nor yet have the words repartee, embarrass, chagrin, grimace; which all must plainly have been both novel and affected at the time when Dryden wrote."

It cannot be said that the naturalization of foreign words ever ceases in a language which is still properly living. There are periods when this goes forward much more largely than at others; but there is never a time when one by one these foreigners are not stepping into it. We very rarely, to be sure, observe the fact while it is going on.

It is indeed impossible to conceive anything more gradual than the process by which a foreign word becomes an English one. "It appears to me," says Mr. Trench, "that we may best understand this by fixing our attention upon some single word which at this very moment is in the course of becoming English. I know no better example than the French word *prestige* will afford. Prestige manifestly supplies a want in our tongue; it expresses something which no single word in English could express; which could only be expressed by a long circumlocution; being that moral influence which past successes, as the pledge and promise of future ones, breed. The word has thus naturally come to be of very frequent use by good English writers; for they do not feel that, in employing it, they are deserting as good or a better word of their own. At first all used it avowedly as French, writing it in italics to indicate this."

Besides this adoption of foreign words, as occasion seems to need them, there are yet other ways in which new words are derived. Our language admits of two or more words being formed into a new combination, thus affording convenient terms of a compound meaning. Another way in which languages increase their stock of vocables is the forming of new words according to the analogy of formations, which time, acting on the genius of the language, has previously sanctioned. Thus, upon certain substantives, such as nation, congregation, convention, have been formed their adjectives, national, congregational, conventional. Singular as it may seem to some, starvation is a word but very lately introduced to us. We have it on the authority of a writer in Notes and Queries, that it had not appeared in any English dictionary published up to 1836. It sprang up in America, and was first used by WEBSTER, it has since maintained itself as a very expressive and serviceable word. Though formed on the model of preceding formations of a kindred character—its framer did not apparently observe that he was putting a Latin termination to a Saxon word—an oversight, however, of very little consequence, as the compound elements admirably coalesce, and in no word perhaps were ever united better.

One of the most curious instances of the development of words is that by which a number of nouns, verbs, and adjectives, have grown out of proper names. To begin with mythical antiquity—the Chimæra has given us chimerical; Hermes, hermetic; Tantalus, to tantalise; Hercules, herculean. Gordius, a Phrygian king, who tied that famous Gordian-knot which Alexander cut, will supply a natural transition from mythical to historical. Here Mausolus, a king of Caria, has left us mausoleum; Academus, academy; Epicurus, epicure; Philip of Macedon, a philippic, being such a discourse as Demosthenes once hurled against him, the enemy of Greece; and Cicero, cicerone; Mithridates, who had made himself poison-proof, gave us the now forgotten word mithridate for antidote; as from Hippocrates we have hippocrass, a word often occurring in our early poets, being a wine supposed to be mingled according to his receipt. Lazarus, perhaps, an actual person, has given us lazar and lazaretto; and Simon Magus, simony. To come to more modern times, a Roman cobbler, named Pasquin, has given us pasquinade; Colonel Negus, in Queen Anne's time, first mixed the beverage which goes by his name; and Lord Spencer first brought into fashion a spencer. Dahl, a Swede, introduced the cultivation of the dahlia.

MY DREAM OF THE RAINDROP.

BY MARION WAYNE.

A FEW evenings since, I was in my laboratory engaged in making preparations for a lecture before my class in chemistry. Before me on the table were the retorts, the furnaces, the India-rubber tubing, the wash bottles and all the paraphernalia of the chemist's workshop. At my right were two gasometers whose invisible contents were soon to unite in illustrating to the tyro the truths of Chemistry. All was ready. I looked at my watch; it wanted still half an hour to the time fixed for the class to assemble. Taking from my pocket the evening paper, which I had not yet had time to look at, I seated myself in the arm chair just back of the gasometers and read the story of the "Onandaga Giant." I settled myself back to the strangeness of that story, when on looking up I beheld in place of the zinc gasometers two beings enormous in size, united together after the manner of the Siamese Twins. To describe these beings, forms, or whatever they were, is wellnigh impossible. They were ten feet or more in hight, of an ashy color, with countenances noble and expressive. I was not frightened, but pleased with my strange companions. Stooping down they lifted me up, and carried me away. I was borne over the hills, through the woods, across the rivers, along the mountain ridges, and into the caverns of the earth. The journey was long and I began to be weary of it. At last I was placed in a garden whose exquisite beauty recalled to me my youthful ideal of Eden. A pure river of crystal water flowed at my feet, soul entrancing melodies filled the air, and perfume of delicacy greeted me from a thousand flowers whose luxuriance filled the landscape sloping at my feet.

As I was reclining on the green carpet of the earth, a dark cloud which I had not before observed came directly over my head, from which a single drop fluttered down and lit in the hollow of an opening rose bud at my right. This was nothing unusual but I was in fairy land. The bud commenced to open and soon became full blown; from the midst of it sprang a tiny form which I immediately knew to be one of the sprites of this goodly place. Without a word of introduction my little friend thus discoursed.

"I am the fairy of the rain drop; our queen has bade me come and reveal to you the mystery of my origin, the names of my relatives, the influence I exert, and my future destiny. Listen. There was a time when the earth was not, when the sun, moon and stars existed only in the thought of Him who rules over all. But it did not seem good in the eyes of Him that thick darkness should rule in the realms of immensity. The creation was begun. First two fairies were made, invisible and intangible whose names were Oxygenomai and Hydrogenomai.

With playful glee they ran up and down the paths of space, watching the beauties and wonders that were unfolded by the great Creator. In their wanderings they lighted upon a small orb third in distance from the sun, without form. Come, said Oxygenomai, the elder, let us beseech our Father that he give us permission to make this unsightly orb resplendent with beauty, meet for his glory and honor. On light wings they flew to the Father's presence. With the permission granted them they hastened to their self-imposed task. It seemed almost hopeless to them with all their fairy power, to bring from this confused mass of metals and solids the ideal of beauty they had formed. They began, and under their fairy fingers, these rough and uncouth masses were transformed into rock and soil, scattered up and down the surface of the earth. I will now, said Oxygenomai, unite myself with most of what remains of this mass of metals and other solids. As she did so, they became under his magic touch, a molten mass boiling and seething in the center of the earth. All was not yet done. There flew to them from distant realms a younger sister sprite, whose name was Nitrogenomai.

Come, said the eldest of the three, let us unite our powers and envelop this goodly orb with a covering, that shall protect it and regulate the eat from within and from without, in which also may live man, the noblest being our Father is yet to create. Under their influence the world was surrounded with a blue covering, forty-five miles in depth. And still there was something lacking. From pole to pole nothing was seen but an arid waste, and a burning desert. The object of the fairies was not yet accomplished. There was an almost insurmountable barrier. Oxygenomai and Hydrogenomai pondered long and anxiously over this, for their world was not fit for the glory of the Father. But with all their fairy and magic power they grew hopeless of accomplishing what they anticipated. Weary with thought and sinking in despair, they threw their tiny arms around each other's neck, and lo! amid the thunder of the heavens, they became a drop, limpid and pure, clear as crystal, yet variegated with all the hues of the rainbow.

Surprised at this sudden change, they sought the world beneath them, and lighting upon its arid sands, a change was wrought more wonderful and beautiful than all that had yet been done. The earth was suddenly covered with beauty, forests sprang into existence, flowers bloomed upon a thousand hills, rivers and brooks meandered through the valleys.

The deed was done; the earth was completed; and the morning stars sang together for joy. My little fairy sank back into the rose bud, and as the petals closed over the tiny form, the entrance of my class awoke me from my dream of the RAIN DROP.

THE PHONOGRAPH.

WILL 'wonders ever cease?' It has taken man with all his ingenuity, research and progress, some thousands of years to become acquainted with the properties of atmospheric air. He has learned to weigh the earth, the moon and the other planets, to calculate their sizes and distances, to foretell eclipses, to calculate with some degree of precision the return of comets; has learned to encircle the globe with a message in a few minutes, has learned to utilize the sun as an artist, and that too, even without his presence; and all this has been done before he became thoroughly acquainted with the air he breaths.

True, he had learned that air is no inconsiderable part of the life of all things that live, the medium through which sound and heat travel, [That air is not necessary for the transmission of heat is proved by its absence from interstellar space through which, nevertheless, heat travels. ED.] and although it receives into its embrace all the filth and putrescence of the earth, still it is the great purifier of the medium in which man and all animal and vegetable kingdoms live. He has learned that it is the most elastic substance known, and he has even conjectured that with sufficient force it might be compressed to a solid. He has learned that the spores of microscopic plants and the germs of disease float in it invisible to the unaided eye. But it has been left to this latter day for man to utilize this invisible compound gas, not merely as a stenographer, recording words spoken; but as a reproducer of the very words themselves, with all the modulations of the original utterer.

What next: Will you next invent or discover a process by which we shall be able to *see* the quivering, trembling or gyratory and oscillating motion of the air as it passes through the intricate moves of contending sounds, as it wends its way through intervening hills and forests, or is echoed back from cliffs and promontories, and still reaches the tympanum of the ear that hears it? When you have accomplished this, we may well exclaim with Simeon of old "now lettest thou thy servant depart in peace."

A man by the name of Symmes, a few years since, propounded a theory that the earth was hollow, open at the poles, that vessels might sail in and people enjoy life there, and since then a Californian, without any complement or even reference to Symmes, advances the same idea, and furthermore has published a book entitled, "The Hollow World," in which he proves apparently to his own satisfaction, that the inside is much preferable to the outside as a place to live in, produces some startling evidence (if the facts he states are real) to prove that the undercrust of the earth, the comparatively thin layer between the outside and inside of this planet, is frozen solid instead of being liquid fire, as his predecessors have taught.

Who knows that these theories are untrue? and that we had better not brave the rigors of the northern pole for the sake of living in a more delightful climate inside? The days are past when a Galileo can be persecuted and imprisoned for saying "the earth moves." Go on, ye philosophers, and reveal further the hidden facts that shall result, not perhaps in the increased happiness, but in the increased wisdom of mankind. Go on in your own way, regardless of the wishes of an obscure individual like myself. But, humble as I am, I dare to make the suggestion, whereas through the rapacity of man, the timber of the earth is fast becoming exhausted, that for all we know coal is limited, while from the removal of the timber cold is increasing as well as rain diminishing, what shall we eventually do for lights and fuel? Therefore, we pray you to teach us to burn water to fire up our engines, to give us light and to keep us warm. Is not the thing practicable? Hydrogen, which constitutes one-third by measure of water, is said to be inflammable, and when separated from the oxygen and burned, will it not again unite with the oxygen and form water? If so, one need not fear the exhaustion of water by this process. S. B. P.

FARMERS AS CITIZENS.

THERE is no reason in the nature of his calling why the farmer should not be the peer of the foremost of his countrymen in all the essential elements of citizenship. PAUL'S charge to TIMOTHY implied that only through his own fault could his youth become despicable. If farmers have been despised, they have themselves to blame. If they have not gained admission to the highest social circles, it is because they have not prepared themselves for such circles. If the legislation of the country has been adverse to their interests, the cause must be found in their own neglect of political duties.

If they are compelled to pay as much tax on one hundred dollars' worth of their real estate as other men pay on five hundred dollars' worth of personal property, it is because they have delegated their law-making rights to men who have not regarded their interests.

The farmer is more than a farmer. He is a citizen, possessed of all the immunities, and bound by all the obligations of citizenship. Society is an aggregate, of which every farmer, as much as any other man, is an integral part. And it is just as exalted or debased as are any of its components. Our Government is of the people; it takes its character from the people, and is better or worse for the active influence or the wilful neglect of every farmer. "Every one to his trade," is the cry of the politician. "The farmer to his plow, the merchant to his store," and he should say, "I to the public crib." He would keep away from participation in public affairs a great class whose intelligence would detect and whose integrity would expose and thwart his selfish schemes. Farmers, mechanics, manufacturers, laborers, all who are honestly striving with head or hand to create the means of sustenance, shelter, and culture for themselves and others—all these are interested in the just and economical administration of Government.

Giving to the farmer the same general education to begin with, there is nothing in the nature of his calling, rightly pursued, which disqualifies him from becoming a legislator. Accustomed to acquire property by slow but legitimate methods, he places a true estimate upon it, and would enact judicious laws for its protection. His familiarity with, and easy access to farm and other laborers make him a fit man to represent the labor of the country, which is the source of its prosperity.

Does any one question the ability or reliability of farmers as legislators for farmers, let him compare the votes of the farmers in the Legislature of his State, the next session, with those of an equal number of lawyers or men of any other calling. If, as the New York State Farmers' Alliance affirm, real estate owners pay year by year, fivefold more taxes than owners of personal property, men should be sent to the Legislature who will investigate the subject and provide a remedy. If railroad corporations make discriminations, farmers and others who are interested in the matter of transportation, should send men to the Legislature who will undertake to right the wrongs in the carrying business of the country, not fearing or neglecting to battle with a wrong because it is great or difficult of remedy. Farmers need not neglect their business while they become better and more influential citizens. C. H. D.

Warsaw, N. Y.

A RUSSIAN STORY.

THE Russian princes in Paris are all men of large incomes, but generally spendthrifts. One of them borrowed the sum of ten thousand francs from a money-lender, giving his note for the same. On the day it fell due the holder presented it for payment, and was told by the prince that he had no money to waste in paying debts. At that moment a gentleman entered, and the prince handed him twenty-thousand francs to meet the losses of the night before at the club. The lender tore up his note-of-hand, and said, when going out:

"Now, prince, there is nothing between us but a debt of honor."

The prince bowed, and handed over the money without a word. The second begins in the same way, but when the lender presented his note the prince flew in a passion, called him hard names, and, drawing a revolver, made him eat the note-of-hand.

A few days later the lender received his money, with a thousand-franc bill thrown in as interest. Shortly afterwards the lender received a letter from the prince, informing him that he was again in want of money, and telling him to present himself with ten thousand francs and stamped paper upon which to write his note-of-hand. The lender came with the money.

"Where is your paper for the note?" he said, taking the money.

"Here it is, prince," said the lender, drawing a large cake of gingerbread from his coat pocket.

The prince laughed at the joke, and shortly afterwards paid the debt, with interest.

BRIC-A-BRAC.

BY C. H. E. R.

THE presents made to churches in the olden time by pious folk or repentant sinners, and the charges which appear in their books for popular festivals and the performance of Miracle Plays, throw much light on the simple realism of our forefathers. A notable example occurs in the life of "Maister Conynge," the hero of Chatterton's Rowley Poems. Sir John Harington, writing about the year 1596, quotes a memorandum which was found—among other curiosities—in the cabinet of the late John Browning, Esq., of Barton, near Bristol. This curious memorandum, which was first printed in Lord Orford's "Anecdotes of Painting," in 1762, sets forth that "Maister Cahynge hath delivered this 4th day of July, in the year of our Lord 1470, to Maister Nicholas Petter, Vicar of Saint Mary Redcliffe, Moses Counterin, Philip Bartholmew, procurators of Saint Mary Redcliffe aforesaid, a new sepulchre well gilt with golde, and a civer (cover) thereto." Then follows this description of the wonderful gift:

"Item:—An image of God Almighty rising out of the same sepulchre, with all the ordinance that 'longeth thereto; (that is to say) a latho made of timber, and the iron-work thereto. Item—Thereto 'longeth Heaven, made of timber and stain'd clothes. Item—Hell, made of timber and iron-work thereto, with divils to the number of thirteen. Item—Four knights armed, keeping the sepulchre, with their weapons in their hands; that is to say, two axes and two speers, with two panes—a large shield which covered the whole body. Item—Four payr of angels' wings for four angels, made of timber and well painted. Item—The Fadre, the crowne, and visage; the ball with a crosse upon it well gilt with fine gould. Item—The Holy Ghoslt coming out of heaven into the sepulchre. Item—'Longeth to the four angels, four chevelers (supports)."

THERE are many hard things to do in this world, but I know of none that will disgustle a fellow more than to use all one's eloquence in trying to persuade a person to the truth of a thing that you feel in your own heart is not true. Advertising Canvassers and book agents understand this.

To blandly acquiesce in the decision of one whom you wish not to offend, on some point, when you know that the speaker is a ninny-hammer, and altogether wrong.

To have to take a back-seat and listen to the spokesmen of the party making a confounded mess of it, and knowing all the while how much better you could do it yourself.

To use the best argument in your power for your side when you are morally certain that your opponent is an ill-used man.

To be a lawyer and have to brow-beat a fair witness, and imply she is not speaking the truth, when, to meet the same lady under other circumstances, you would consider it an honor, and the greatest pleasure in life to show her every possible courtesy and politeness.

To want a little liquid refreshment for the interior department, and know that your credit is exhausted and the slate broken.

It is supposed by some that the practice of sending likenesses of criminals at large from one town to another, dates only from the introduction of photography. It is much older. In Massinger's play, "The Duke of Milan," published in 1623, Graccho, after telling Francisco that he is a "condemned man," adds:

"All passages
Are intercepted, and choice troops of horse
Scour o'er the neighboring plains; *your picture's sent*
To every state confederate with Milan."

Reviews.

RECENT LITERATURE.

N. W. Ayre & Son's Manual, now in its third edition, is an excellent hand-book for the advertiser, and it condenses clearly about all that it is essential to know on the subject of advertising, and we can recommend it to the business public.

The third number of The American Bicycling Journal reaches us brimful of enthusiasm on the subject of bicycles. That the idea of cavorting over the land at a rate somewhat less than steam, is captivating to the fancy, may be judged by the fact that The Journal has bloomed into a weekly ($2.50 per year) and has a satisfactory patronage. Those interested in the sport should read the paper. It is published at Boston.

That Wife of Mine. Boston: Lee & Shepard.

The author of "That Husband of Mine" concludes to look at the reverse of the medal, and as was to be expected, as he speaks of lovely woman, "It" has made a cleverer book than was the first venture, and this is using "tall" language. That wife is a charming little Americanized German who, when excited, takes droll liberties with the vernacular, but is altogether so charming, that the reader envies the husband his exclusive right of possession. We shall not anticipate the reader's curiosity by skeletonizing the plot. Read the book, and then "declare to the tocsin" that it is capital. A paper edition is sold for fifty cents, while the more durable boards may be had for $1.50.

Economic Monographs. No. I.: Why we Trade, and How we Trade. By David A. Wells. No. II.: The Tariff Question and its Relation to the present Commercial Crisis. By Horace White. New York: G. P. Putnam's Sons.

In these small pamphlets are condensed the gist of the causes of our present troubles, and the palpable way out of them. We are glad to see that the pertinent views of such men as Mr. White and Mr. Wells are put into this popular form, and we earnestly recommend every reader of this journal to expend twenty-five cents and secure the treatises. Their intelligent perusal will do as much to set their views aright as to the causes of our commercial depression as the illimitable demagogue has done to befog them.

Especially to be commended is the plain, clear, succinct way in which the argument is put. The simplicity of style alone is irrefragible proof of of the grasp of the subjects by the writers. The simple need not fear to encounter words of learned length and thundering sound. We are too modest to make any suggestions to some of our wonderfully informed contemporaries further West, but it would seem as if the careful study of these unpretentious little books might have a very modifying effect on their ideas of political economy. Their editorials would thereafter read less like the exploitation of the wonderful schemes of "Col. Sellers," particulary where they dwell on the advantages of unlimited silver. Again we commend the books.

Complete Arithmetic—Theoretical and Practical. By W. C. Peck, Ph. D., LL. D. New York: A. S. Barnes & Co.

This is a clear presentation of the science of numbers, admirably arranged and carefully written. The difficulties of the subject are explained in an admirably clear manner. The publishers have supplemented the work of the author by good typography and substantial binding, that are hardly secondary merits in text-books. Teachers will find this book well worth their consideration.

Love and Duty. By Mrs. Hubback. Philaldelphia: T. B. Peterson & Brothers.

This book will appeal to a large circle of readers. The story is exciting and the interest is sustained to the end. "Love and Duty" makes the twelfth volume of the "Dollar Series."

The Art of House Painting. By Jno. Stevens. New York: John Wiley & Sons.

This clever little treatise tells the unprofessional painter about all it is necessary to know if he desires to do anything with the pot and brush toward embellishing the premises.

For Women.

CONDUCTED BY MISS FAITH RIPLEY.

LOVE SONGS.

RONDEL.

Kiss me, sweetheart, the spring is here;
And Love is lord of you and me!
The blue bells beckon each passing bee,
The wild wood laughs to the flowered year;
There is no bird in brake or brere,
But to his little mate sings he:
"Kiss me, sweetheart, the spring is here
And love is lord of you and me."

The blue sky laughs out loud and clear.
The missel-thrush upon the tree
Pipes for sheer gladness, loud and free;
And I go singing to my dear:
"Kiss me, sweetheart, the spring is here,
And Love is lord of you and me."

RONDEAU.

Life lapses by for you and me,
Our sweet days pass us by and flee;
And evermore death draws us nigh,
The blue fades fast out of our sky;
The ripple ceases from our sea,
What would we not give, you and I,
The early sweet of life to buy?
Alas! sweetheart, that cannot we;
Life lapses by.

But though our young years buried lie,
Shall Love with spring and summer die?
What if the roses faded be!
We in each other's eyes will see
New springs, nor question how or why
Life lapses by.

[*John Payne, in London Athenæum.*

A FAMILY TALK.

MRS. POTIPHAR.

From time to time there ascends a lamentation because American women are averse to having large families. Direful prophecies as to the extinction of the race fill the air, and women are called upon by the love they bear their country to amend their ways.

The gentlemen who indulge in these jeremiades make a great ado about *quantity* and lose sight entirely of quality. Pat's dirty, ill-favored, ignorant brood, most of whom will find their way at one time or another into some one of our penal institutions, are of more account in the eyes of these clammorers for "more children" than the well trained and respectable solitary child of American parents. It seems to me to be preferable to sacrifice numbers to superiority, but it is quite likely that this is one of those problems which the stupendous intellect of man is alone capable of grappling with. These lamentors make no distinctions; their command to all women whatsoever their circumstances, is to bring forth children.

"What is there commendable in bearing children to a heritage of sin and of poverty?" If a man and a woman love each other sufficiently well to brave the privations and sacrifices that a life of poverty entails, that is a matter which concerns them two alone, but what right have they to bring little children into their world of deprivation? Parents who are physically, morally or financially weak have no right to children. It is the basest sort of selfishness for people to become parents unless under the best possible conditions.

Do you demand Scriptural authority? You have it in the Golden Rule. Look back over your own life, embittered, perhaps by inherited disease, or grinding poverty.

Think of your struggles, of the noble ambitions that came to naught for want of means for their attainments, of the weary treadmill life, where you plod on, plod ever, and with no hope but the grave, and remembering all you have suffered, can you, will you, be instrumental in forcing your child to drink of the same bitter cup? Is that doing as you would be done by. Is it not rather a most heartlessly cruel procedure?

A child has a right to be well born, a right to the broadest culture and to the grandest and richest experiences of life.

Try and realize the misery that disease and poverty cause the world. Think of the thousands of worse than orphans, who crowd our cities. Poor little waifs, forced from their babyhood to fight their own life battle, cursed at and bullied by the great unfeeling world, and so on up through the different *gradations* of penury, the lives of the children in a greater or less degree are lives of toil and of privations.

Of all this though, the gentlemen who clamor for the expansion of the race take no account. "Give us the children" they cry, "What if many of them are cruelly confined at a tender age in stores, and factories, and that very many die from want of proper care, and that some of them

Fig. 2—Catchall.

will be vagabonds and hardened wretches, so that as to-day our prison population foots up to 40,000, "Give us the numbers!"

What would the world have lost had those 40,000 never been born? It is appalling, such an amount of concentrated wickedness. Who is to blame? The parents? Indubitably. They failed in some particular to do their whole duty by these their children.

It redounds to the honor of American women that they shrink from assuming responsibilities of this kind on the wholesale and reckless plan in vogue among foreign peoples. There is another phase of this question that I will merely hint at. Did our Creator design that woman should spend her whole life in a nursery? Is she just to her best and highest nature when she sacrifices all the grand possibilities of her life to the petty details and the wearying routine of cradle tending.

WHAT ONE WOMAN HAS DONE.

Having read with much interest the articles on woman's work which have appeared in the Rural, I am tempted to myself "unfold a tale," which will doubtless surprise those who insist that woman is a most "weak vessel." My husband bought an unimproved farm. There were about fifteen acres cleared, and not a sign of a fence on it. Beside the care of three small children, I assisted my husband in his out-door work. The Rural readers will remember that during the late war, Uncle Sam was so greedy for men, that there was hardly enough left to do the farm work: and as my husband was nearly worn out with hard work, he was in despair at not being able to obtain assistance. I offered to help him out of his strait, and he laughed me to scorn. I insisted, however, on his preparing a scythe, and told him I would make the attempt at any rate.

The scythe was brought, and unto the fields I went to commence my work, and to my husband's surprise (by his mowing around the stumps), I was able to keep right up with him. We mowed until noon; then the hay was ready to be raked up and drawn into the barn. My husband helped me rake around the piece until he could commence loading; then he and one of my little boys began drawing the hay into the barn, which was about twenty rods off. I could rake as fast as they could draw it in to the barn—so our haying was soon finished up for that season.

Then came harvesting. I aided my husband in raking and binding the oats or wheat, or setting-up buckwheat, digging potatoes, or in almost any kind of farm work. I also made our own cloth in the time of war, made linen for summer and woolen for winter, which was a great help, as such goods were very high in those days.

I continued to help my husband in the field (if necessary) until about three years ago. Four or five years ago my husband was taken sick; he could not work, but was around. It was getting rather late for digging potatoes. I asked him if he could drive the wagon into the field where the potatoes were; if he could, I would go and dig potatoes. At this time we had a dairy of sixteen cows; had no help, excepting my daughter, who was teaching school. Well, I went to work digging potatoes. I think it was nearly noon when I commenced; I dug till 3 o'clock. Then we carried sixteen bushel baskets full of potatoes into the cellar.

We increased our dairy so that a year ago last summer we milked twenty-two cows. I have done all my house work and the dairy work without assistance, excepting the working of the butter. That part fell on my husband to do. Last season we had a dairy of twenty-six cows. I also did my work alone the most of the time. All through the summer season I get up early on Monday and do my washing before breakfast—have that ready at 7 o'clock. We keep hired men most of the time.

Some will say, "That is a Dutch woman, or she never would perform such labor." But I say nay; I am a Yankee. I sometimes write a piece for our County paper; I am also agent for a medicine in your city. I get up clubs for the Rural New-Yorker.

L.

[In face of such a working record as the above, what have those who so dismally howl about the physical degeneracy of women, to say?—Ed.

TOILET BOX.

The foundation of this pretty addition to the toilet table is a very strong cord or wooden box: on the lid of this are arranged five smaller boxes as shown in the design. The foundation box measures twelve inches long, seven inches wide and two inches deep. The center one of the small boxes on the top is larger, than the four others! the others are all one size; they must be carefully fixed to the lid of the foundation by strong glue. The boxes may be made by glueing pieces of thin cardboard into the required form and lining them with tin-foil; they with the foundation are next covered with the separate petals of fir cones fixed with glue; acorns, oak galls, the shells of beech nuts, small fir cones, and seed vessels, are arranged on the lid of the foundation according to taste. A small round pin cushion is fixed to the lid of the center box which is ornamented to correspond with the foundation. The outer covering of a beech nut with a little of the stalk attached is glued to the center of the lid of each of the little boxes to form a handle to lift it off with. The center box serves as a receptacle for small articles of jewelry; the others for powder, lip salve, pins, &c. The foundation will answer well for a glove or handkerchief box. After the whole is completed it should be varnished with good copal varnish.

Fig. 2 is a catchall. It is a Japanese cuff of brown straw which can be bought for a small price at a Japanese shop. Embroider a pattern over it, line it with silk or satin, and fasten a small bag of the same material to the bottom drawn up with a ribbon, bow or a tassel.

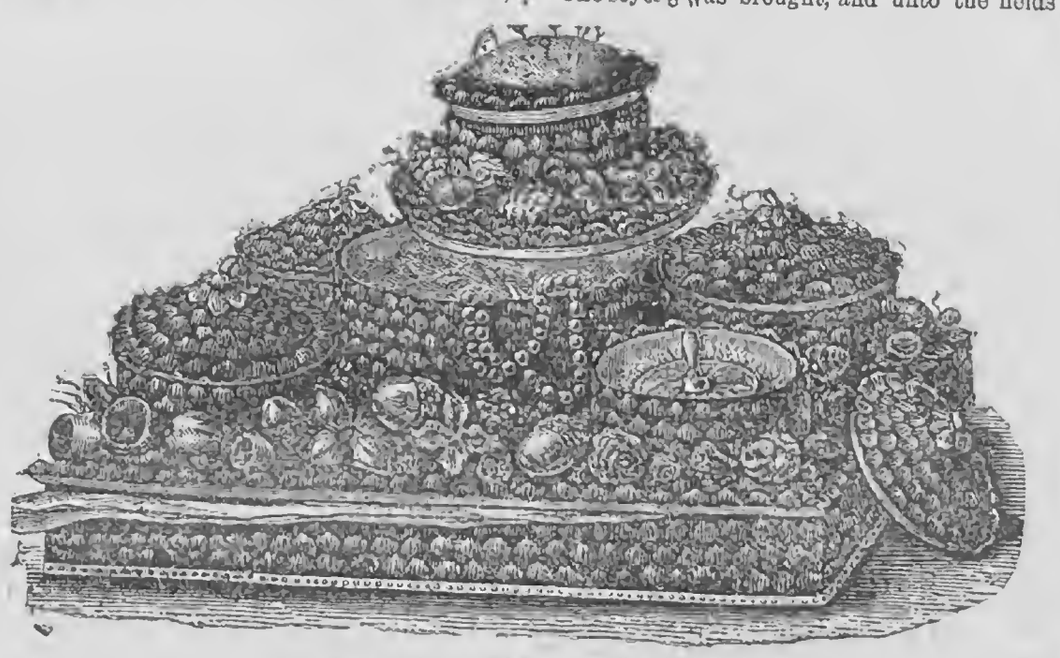

Fig. 1—TOILET BOX.

GRANDFATHER TO THE FRONT.

I am afraid grandmother doesn't live in the country where she was born and reared, but has followed one of the daughters she cuddled in her bosom to the city when she has become the wife of some fashionable, and has given herself to society. My experience has been, in cruising around the world, that the changes we notice are more in ourselves and our changed situations and surroundings, than in the difference in matters in general. When grandmother was young, she moved in one circle; now she is older, and moves in another circle, she looks through different eyes—not because there was not just such a place when she was young as she now occupies, or because there is not just such a place now as she filled when a girl; but because then it was not her desire to be where she now is, or it was not within her power—at least she was not there. She may live in the house where she was born, and her country home may have become the center of a great city, or some upstart village more presuming in its demands for fashion; may she not, if she will, find just such a place as she lived in when a girl? Would she know it if she found it?—if she found it and knew she had found it, and could take just the same place there that her old grandmother filled when she was nestling on her mother's breast, or exchanging glances with some of the stalwart sons of her mother's neighbors. Would she do it? Would she?

Grandfather.

Let us give to women such training, physically, industrially, intellectually, and spiritually, that we shall shame the words "supernuous" out of the vocabulary, as descriptive of women. And this will help men, and elevate them, quite as much as any special work which might be done for them.—*Mary A. Livermore.*

L. E. S., Waynesville, N. Y.—Unless you can afford to purchase a new black silk next season, we would not advise you to get a damasse. Plain silks are always more serviceable, and if tastefully trimmed are quite as elegant as fancy ones.

The Querist.

ANSWERS TO CORRESPONDENTS.

Poultry House for 100 Fowls.

L. D. W., Fredericktown, Ohio.—Will HENRY HALES please give, in RURAL, a plan of a poultry house of sufficient size for one hundred fowls—to be housed if necessary, but generally allowed to run at large?

ANS.—A house for this number of stock, should not be less than fifteen by twenty feet clear inside room. If built against the south side of a barn, so as to have a southern frontage, it will do as well as standing detached, and save material; for if built alone it will require a roof coming to a ridge in the center; six-foot posts for the corners, with sills set on stones, on the level ground, unless it can be built on stones on a southern hillside, which is better yet. In this case, the hill can be excavated for the north side of a good, warm house; then a large window on the east side, nearer to the front than the back, gives the birds the early morning sun so much needed by poultry. This window should be at least four feet wide, and five feet high, coming down close to the sills, as all glass should do in fowl houses in cold sections, so that the stock get the full benefit of the winter sun on the floor. There should be no opening on the north or west sides, except a ventilator in the latter, as well as in the east end, quite up to the ceiling; the door can be either on the east end or in the front. The front should have a large share of glass, say eight to ten feet wide and five feet high as at the end. The glazing can be done cheapest if stationary sash bars are used, in which case the ventilators in the ends of the house should be large, so as to admit plenty of air in summer. They can be fastened open to any desirable extent by a hooked rod pierced with holes at intervals. This ventilation is of the first importance for the health of a hundred fowls when kept together. Seldom will both ventilators require to be closed entirely.

Where stone is abundant, it will make the best of houses, laid up roughly and pointed inside. If wood is used, upright boards should be battened, but clapboards are better. A shingled or battened roof is better than one of felt, which is worth nothing. A square ventilator, like a little chimney, in the center of the roof, is very desirable. The top, outside, should have a cap on to keep out rain, with openings all around, and a little slide on the inside to be shut only when the thermometer reaches down to zero. There should never be glass in roofs. The inside, if wood, should be roughly lathed and plastered; one coat with plenty of hair will do. Unless some such plan as this is used, a large number of birds together will be difficult to keep in health; but with such a building and needful cares, as laid down in the RURAL from time to time, it can be done profitably. In addition to the house, a shed on the north side, open to the south, where the birds can dust themselves, and retire from bad weather, is useful. On a farm, a house can be sometimes built adjoining a hovel, which is beneficial for the stock. For interior arrangements, the RURAL has often given ample directions. A plan for the arrangement of nests was illustrated in number for March 31st, 1877. Perches should not be ladder-form, but all parallel, of one hight, lying loosely in notches on a frame.

Prickly Comfrey.

O. L. W., Gasport, N. Y.—Some time since there was considerable discussion about the merits of Prickly Comfrey. I have seen nothing with regard to it lately. Would be obliged to you if you would inform me if it has proved of value the past season.

ANS.—Prickly Comfrey has often been referred to in these pages, as a plant found to be profitable in certain places, under particular culture and circumstances. There seems to be a very wide difference of opinion with regard to its merits. Among those who have cultivated it, some are quite enthusiastic in its favor, others think but little of it, and others again, revile it; a thing very freely done by many who have never seen it cultivated. Our own personal acquaintance with it is too limited to enable us to speak decisively with regard to its good qualities, and we shall be pleased to publish any information on this point furnished by any of our readers who may have *practical* experience of it.

Miscellaneous.

A subscriber.—Is the Queen City Glass and Lamp Company of Cincinnati, reliable?

ANS.—We know nothing about this company, but so many fraudulent enterprises have had headquarters at Cincinnati recently, that more or less discredit is cast upon everything emanating from that city, that has not the prestige of an established reputation.

Van.—I have a cow which I discovered about three weeks ago began to milk unusually hard in one of her teats. On examination I discovered a hard, round substance very near the end, which I fear will result in a loss of the teat.

ANS.—From this meager description a certain diagnosis cannot be made. Without a doubt, it is a tumor of some kind. As you had to make an examination to discover it, it probably can not be a lacteal tumor. A lacteal calculus would not stop the flow of milk, if of the size you describe. It probably will, in time, render the teat useless. It would be well to consult a veterinary surgeon and have an operation at once.

C. B. W., Detroit, Mich.—Will the RURAL be kind enough to inform me what are the standard books on sheep raising, and in what State in the South it could best be done. These questions have been raised in my mind by your recent article on the subject.

ANS.—Randall's Sheep Husbandry in the South Randall's Practical Shepherd. Sheep husbandry is largely carried on in Texas, and has proved a paying business there. Georgia, however, claims to be the great future home of the sheep in the South.

C. E. W., New Way, O.—(1) Do you publish Randall's Practical Shepherd? If so, what is the price wholesale and retail? (2) If not published by you, where can it be got?

ANT.—We publish nothing but the RURAL NEW YORKER. (2) Woodward & Co., Park Row, N. Y.

H. W. M., Newark, Del.:—Please let me know whether you have a copy of "Money in the Garden," by Quin?

ANS.—Yes, for our own use. It is published, however, by Woodward & Co., Park Row, N. Y.

News of the Week.

CONDENSED NEW YORK TELEGRAMS.

TUESDAY, Jan. 29.—There is a report that Sitting Bull is once more in the field; but so many *canards* have appeared about him, that this is possibly another.

The Conservative Ministry of England have decided to challenge a vote of confidence on the question of war or peace. All is still in doubt about armistice or peace negotiations. No news from negotiators; Russians and their allies pressing forward as hard as possible. Typhus raging in Erzeroum; 250 die daily—10,000 sick and wounded in hospital.

WEDNESDAY, Jan. 30.—In the Senate, the debate on the Silver Bill still drags its slow length along. No doubt of its passage by a vast majority, and strong probability of its passage over the President's veto, which is not quite certain to be put upon it.

Russia has assured England that the question of the passage of the Dardanelles being opened to Russian vessels only, shall be left to settlement by the European Powers. The liberals in the English Parliament are going to make the vote for £30,000,000 asked for by the Government for precautionary war expenses, a question of want of confidence in the present Ministry. They are sure to be defeated, however, by a very large majority, as the war spirit is rapidly spreading. Russian scouts are within 70 miles of Constantinople. Suleiman Pasha is at Boulair, Mehemet Ali at Constantinople. The whole coast of the Bosphorus is covered with starving refugees, and appalling misery there and at Constantinople makes the people turbulent, and reckless, so that an outbreak against the Christians may at any time take place.

THURSDAY, Jan. 31.—The Republicans in the House have defeated a resolution with regard to whiskey in bond, and carried a substitute not to reduce the whiskey tax. This is said to indicate a loss of Democratic control, of that body. The Trunk lines of railroad have agreed to stop cutting rates on freight, and re-establish old rates.

England is terribly agitated about going to war. The Conservatives or war party are almost united, the Liberals, or peace party split up hopelessly, many of them favoring war as strongly as the most violent Conservative Turkhophilites. In the parliament the government expect 100 majority. Austria is taking a stand that may lead to an anti-Russian alliance with England; the more so as Russia is acting very mysteriously in pressing forward while talking peace—peace. There are in Constantinople 150,000 refugees lacking food, shelter, and clothing. The whole Mussulman population of Turkey seems to be moving towards Asia whence their ancestors crossed over four hundred years ago.

FRIDAY, FEB., 1.—During the late terrible gale the steamer Metropolis, from Philadelphia to Bahia, with 200 laborers going to work on a Brazilian railroad, having sprung a leak, was run ashore three miles south of Currituck Lighthouse, near Kitty Hawk, N. C. close to the spot where the U. S. Steamer Huron was lately lost. About 150 persons mostly passengers were lost. Three women only on board, one of whom alone has been saved. Loud complaints of the inefficiency of the local life-saving station, by which 100 lives were lost; and of the unseaworthy condition of the vessel, which was so marked that the fault of moral homicide belongs to those who sent the old rotton craft to sea. Snow-storm general throughout nearly the entire North.

The Britons are clamorous for intervention. Meetings all over the country convened to support the Liberals in their opposition to war, have been seized upon by vast majorities and turned into war meetings, endorsing the Government and urging immediate action. The Home-Rulers in Parliament have determined not to vote on the question of peace or war, a liberal defection. Count Andrassy, the Austrian Prime Minister, has proposed to the Powers, a joint conference to prevent a policy on the part of Russia in concluding peace, unjustly prejudiced to the interests of other Powers. Russia seems willing to agree to this; and the measure may prevent further complications. France is again asserting her position as an important factor in European politics; and will be suitably represented at the proposed conference. Greece regretting her tardiness is going to rush into war with Turkey anyhow, in the expectation that the other Powers will not only save her from the terrible whipping Turkey could easily give her, but reward her rashness with an addition of territory.

SATURDAY, Feb. 2.—The number of lost by the Metropolis seems to be not much more than 100. The survivors are in a pitiably destitute condition. Consular and diplomatic salaries have been cut down $118,000. Secretaries Thompson and McCrary are said to be strongly in favor of the Bland bill. In New Orleans there is loud talk of indicting Secretary Sherman and Congressman Garfield for the part they took in Louisiana politics at the time of the Presidential election. The Louisiana Returning Board, now under indictment in New Orleans, appealed to Judge Bradley to have their case tried before the U. S. Court, on the plea that an impartial trial was impossible before a State Court. Their appeal has been denied.

Members of the Stock Exchange in London, yesterday, publicly burnt, amid groans and hisses, the Times and News and some other papers of pro-Russian tendency. War fever red-hot in England. No news yet from peace negotiators. The Russians are now within twenty-four hours' march of Constantinople, where there is a terrible panic. Hobart Pasha, with the Turkish fleet, has arrived in Constantinople with the garrison of Batoum, which has been evacuated in face of an attack, or owing to a secret stipulation with Russia. The Greeks are going to war, anyhow.

SUNDAY, Feb. 3.—General Miles reports that Sitting Bull has crossed the Canadian line and is at the head of 2,000 men. The bucks from Red Cloud Agency are on their way North, and it is feared there will be a good deal of Indian trouble generally by the opening of spring. Subscriptions are being got up in Norfolk, Philadelphia, and elsewhere for the relief of the wrecked survivors of the Metropolis.

The Sultan telegraphed to the Czar for peace; the answer has just been flashed back: "I desire peace as much as you; but it is necessary for me—necessary for us—that it should be a solid and durable peace." All military movements and emigration of Mussulmans have stopped. Mehemet Ali Pasha was first appointed commander of Para, then of Crete, a further degredation. Gambetta declares for France that the war can only be terminated by a European Congress. Italy proposes to form an alliance with any Power opposed to further Russian aggrandizement and an alliance is proposed between Italy, England France and Austria.

MONDAY, Feb. 4.—The survivors from the wrecked steamer Metropolis have arrived in Norfolk. The captain insists that the vessel was seaworthy. A bogus Roman Catholic Miracle is proclaimed from Mauch Chunk, Pa.—a dead girl called back to life, in sooth!!!

There is a report in England that the British fleet in the Mediterranean has orders to seize upon the Turkish fleet and take it to Malta in order to prevent its falling into Russian hands as a part of the war indemnity. An armistice has just been signed by the Grand Duke Nicholas and Server and Namyk Pashas. The following are the terms of peace:

First.—The erection of Bulgaria into a principality.

Second.—A war indemnity or territory in compensation.

Third.—The independence of Roumania, Servia and Montenegro, with an increase of territory for each.

Fourth.—Reforms in Bosnia and Herzegovina.

Fifth.—An ulterior understanding between the Sultan and Czar regarding the Dardanelles.

Sixth.—The evacuation of the Danubian fortresses and Erzeroum.

The garrison at Widdin has consequently been ordered to surrender their arms and will be quartered among the neighboring villages. Content at Constantinople; great joy at St. Petersburg. All the Powers have accepted Andrassy's proposal for a conference to be held at Vienna. Russia will annex Bessarabia, giving Roumania, the Dobtudscha in exchange. Ten thousand Greek regulars and as many irregular troops have invaded Thessaly, nominally to protect Christians from massacre, really to complicate matters in hope of getting as a sop a slice of Turkey. To January 20th, the Russian loss amounted to 89,304 men.

HOME NEWS PARAGRAPHS.

There were 228 miners killed and 462 wounded in the anthracite coal region last year.

Cattle are dying all over the State of Kansas, it is supposed, from eating smut in the corn fields.

Another outrage on females. Connecticut proposes to tax male and female dogs $10 and $20 respectively.

Within the past two months seventy thousand persons in northern New York have signed the temperance pledge.

Last year Illinois had 2,500,000 hogs, and packed 2,113,845—about one-half of all that were packed in the United States.

A dairyman visiting the city refused to go to one of the theatres the other night, because the word "olio" was on the programme.

The stock of mess pork in Chicago at the present time is estimated at about 128,000 barrels, against 145,000 barrels at this time last year.

There are forty thousand Italians, more than one hundred and fifty thousand Germans, and two hundred thousand Irish in New York city.

The failures in the United States for the year 1877 are 8,872 in number, being 220 less than for 1876. The total liabilities were $190,669,000, or $500,000 less than in 1876,

The value of milch cows in New York equals one-sixth the value of the cows in the United States, and in number is double the aggregate contained in New England.

The Atlanta Constitution says: "The sheep fever is taking hold in Atlanta. It almost threatens to drive the money question out of discussion. Georgia will be the great sheep State of the future."

The following obituary appeared in a Memphis paper on a man killed by an accident:—He was an upright Christian, a good citizen and an ardent patriot, but of limited information with regard to circular saws.

Between forty-four and forty-five million passengers were last year carried between New York city and Brooklyn by the Union Ferry Company, without loss of life or serious accident, only one person being injured.

The sudden change in the temperature last week was severely felt along the St. Lawrence river, There was open water in front of Ogdensburg in the morning, and before night the boys were sailing over it on their ice-boats.

Buffalo-hunting on the Staked Plains of Texas is at its hight; 200,000 have already been slaughtered, and 350,000 more will be before the season closes. The animals are killed for their skins, which fetch 80 or 90 cents a piece, and their carcasses are left to perish.

A farmer in Iowa objects to the publication of any more sermons about hell. He says his crops were eaten up by grasshoppers, his pigs died with cholera, and half his sheep were killed by dogs, while in addition he has been swindled by a lightning-rod agent and two patent right sharpers. He thinks he has received punishment enough.

A crop of English hay, weighing two tons, removes from the soil about 62 pounds of nitrogen, 70 pounds of potash, and 18 pounds of phosphoric acid. From an acre, a crop of clover hay, weighing two and a-half tons, abstracts about 175 pounds of nitrogen, 110 pounds of potash, and 32 pounds of phosphoric acid, Two or three crops grown in succession, and without manure, would partially exhaust even the best of land.

There are in Kentucky 125,000 farms, requiring 150,000,000 pannels of single pannel fence to enclose them. The number of rails required is 2,000,000,000, costing $75,000,000. Estimated cost of annual repairs, $10,000,000. The live stock now in Kentucky is worth $24,121,861. It will be seen from this that more than one-third of the value of this stock is expended in repairing enclosures. About 10,000,000 of timber trees are annually used to keep up the fencing.

Good wheat ought to furnish at least 74 per cent. of fine flour. The best samples often furnish 76 to 80 per cent., and in a few rare instances as much as 86 per cent. of flour has been obtained. Inferior varieties seldom produce more than 68 per cent., and in some instances only 54 to 56 per cent. of flour has been obtained from bad samples. On an average, wheat may be said to yield 75 per cent of fine flour and 25 per cent. of bran and middlings.

Memorial Hall, at Harvard, is the eating place of about 700 students, who bear the cost proportionately, paying an average of less than $4 a week lately. The following is given as a specimen bill of fare for breakfast: beef-steak 300 lbs.; pigs' feet, 50 lbs.; sweet potatoes, four bushels; white potatoes, two bushels; crushed wheat, 46 lbs.; hominy, 20 lbs.; 1,150 rolls; 15 gallons griddle-cake batter; coffee, 6 lbs.; tea, ¾ lb.; milk, bread, and butter *ad libitum*.

The cotton yield of the Southern States for 1877 will reach 4,750,000 bales. This is nearly 300,000 more than that of 1876. The last season was a most favorable one, and but few complained of worms, catepillars and rust. The cotton plant continued to bloom till chilled, and flowers matured into rolls of cotton in sixty days. In 1876 the killing frost that ends the maturity season occurred Oct. 3, while last year it held off until

Nov. 12. The thirty-nine days additional of maturing season were a great boon to planters.

The New Davis Vertical Feed Sewing Machine presents advantages over all other machines which deserve, and rapidly gain for it, the highest favor and popularity wherever introduced. It will do a greater variety of work than any other machine, with less skill or care on the part of the operator, and all without basting. For further information as to its special merits and advantages, address THE DAVIS SEWING MACHINE Co., Watertown, N. Y.

Reliable help for weak and nervous sufferers. Chronic, painful and prostrating diseases cured without medicine. Pulvermacher's Electric Belts the grand desideratum. Avoid imitations. Book and Journal, with particulars, mailed free. Address PULVERMACHER GALVANIC Co., Cincinnati, Ohio.

FOREIGN NOTES.

The Agricultural Laborers' Union of England numbers some 60,000, farm laborers.

The United States Consul at Odessa in Russia reports that the grain crop in South Russia for 1877 is the largest for 25 years.

Forest planting operations in England have now made great progress, the season having hitherto been highly favorable for them.

The rainfall in Ireland during the year just closed has been quite unprecedented, and "'77" will long be remembered as the "wet year."

The reports of English convict prisons show that one of every twenty-five male inmates is of weak mind, insane or epileptic. This does not include those whose minds are sufficiently ill-balanced to warrant their removal to an asylum.

The home guard of England numbers 175,000 men, of whom 133,000 are infantry, 32,000 artillerymen, 7,000 engineers, and the remainder mounted rifles and permanent staff. These men are all well trained in their respective arms of the service. Add to these the yeomanry and militia, and the number of England's home defenders is raised to 300,000 men.

At the Paris Exposition there is to be a pyramid twenty feet square and nearly seventy feet high, representing the 70,000,000 cubic inches of gold which have been produced on the Pacific coast. Surrounding the pyramid will be fifty cases for the exhibition of the minerals of the country. The estimated weight of California minerals to be sent to the Exposition is 500 tons.

Our Consul at Bremen reports that exports from Bremen to America have fallen off, while imports are increasing. Several American agencies recently have been started. The sale of American mowers and reapers has been enormous. American automatic windmills are becoming popular, and the importation of American canned goods is reaching large proportions.

There are four native modes of making butter in the empire of Brazil. The first is by putting the milk in a common bowl and beating it with a spoon, as you would an egg. The second by pouring the milk into a bottle, and shaking it till the butter appears, when it is removed by breaking off the top of the bottle. The third, where the dairy is more extensive, is performed by an athletic native shaking a bag at each end until butter is produced. The fourth, which is considered to indicate vast progress over any of the preceding methods, consists in dragging the hide or leathern vessel, filled with milk, on the ground after a galloping horse until it is supposed the butter is formed. The milk is never strained and the butter never washed.

Professor Blot, the lecturer on Cookery, says that housekeepers should insist upon obtaining BURNETT'S FLAVORING EXTRACTS, as the strongest and most healthful.

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Feb. 2, 1878.

BEANS AND PEAS.—Receipts of beans past week, 6,350 bbls.; Exports, 589 bbls. The offering of mediums is large and prices for even the best hand-picked are easy. Marrows have further declined and there is a better export movement at the lower figures. Pea beans selling only in a small way. Business in both white and red kidneys has slackened and prices favor buyers. Black beans dull. Green peas fewer to sell; now $1.30 for prime parcels. Southern S. E. peas $3.25 per two bushel bag, few in market. Canadian field peas quoted 83c. for general stock.

We quote:—Beans, medium choice, $1.70@1.75; other, $1.60@1.65; marrows, choice, $2.18@2.12; other, $1.85@2.00; pea, $1.60@1.85. White kidney, choice, $2.00@2.20; other, $1.90@2.00; red, choice, $2.20@2.55; other, $2.35@2.40. Turtle soup beans, $1.50. Lima, $3.

BEESWAX.—Small sales are exported at 27@28c. for Western and Southern.

BROOM CORN has increased demand and is steady in price.

Green brush at 6@7c.; green hurl, 6@6½c.; medium green, 5@6½c.; red-tipped, 4@5c., and common red, 3@3½c.

BUTTER.—The market shows increasing firmness for the fancy grades. Fine Western creamery has advanced a trifle, and all strictly choice goods, including selected half-tubs and extra Welsh, feel the upward movement of scarce fine stock. Dealers look for still better prices during the coming week. The point with holders now is to manage the liberal stock of fair and medium qualities. The ordinary run of buyers protest against paying more than our inside rates for State, and they do not do that steadily, when Western factory has real table merit. Holders of really sound, useful State are in no hurry to accept low figures for it, as in the ordinary chances of season we may have a late spring, this year. Their position, however, is weakened by the fact that the crop of State does not show the keeping quality of many former seasons, especially when compared with the success of winter Western makes. The market trade and some exportation give Western best stock a fairly busy movement. Extremely low stock continues almost immovable.

Comparative receipts and exports of butter have been as follows:

	Receipts, pkgs.	Exports, firkins.
June 1st, '77 to Feb. 1st, '78	942,062	140,477
June 1st, '76 to Feb. 1st, '77	338,412	103,372
June 1st, '75 to Feb. 1st, '76	825,987	28,136
June 1st, '74 to Feb. 1st, '75	734,235	32,757
June 1st, '73 to Feb. 1st, '74	760,468	25,623
June 1st, '72 to Feb. 1st, '73	535,412	30,215

We quote State creamery, 25@35c.; fancy pails, 28@30c.; other 25@30c.; creamery, good to choice, 25@33c.; half tubs, fine, 28 30c.; extra, 33@35c.; other, 32@27c.; Fall Welsh 27@29c.; Welsh tubs, dairy, 24@26c.; other, 20 24c.; full dairies, fine, 26@28c.; common, 20@24c.; firkins, 20@26c.; poor State, 14@18c.; Western creamery, good to choice, 40@41c.; poor to good, 25@32c.; factory, choice, 18@20c.; good, 16 18c.; common, 7@11c.; rolls, 12@17c.; grease, 6½@7c.

Receipts for the week, 15,435 pkgs.

Exports past week, 1,678 pkgs

CHEESE.—Export demand continues very good for the period of the year, almost entirely for fancy stock, prices for which are slightly better than last week.

Fancy factories, 13½ 13½c.; good and prime, 12@14c.; fair lots, 12½@12½c.; poor, 10@10½c.; 7@10c., skimmed. Farm dairy, 12@12½c. for good to prime; 10½@11½c. for fair lots; 7@10c. for skimmed; Western factory, cheddar, 13@13½c. for fine 11@12c. for good; 5@9c. for poor.

Exports for the week, 17,523 boxes.

Liverpool cable, 64s. Gold closes 102.

Comparative receipts and exports:

	Receipts, pkgs.	Exports, firks.
June 1, '77, to Feb. 1, '78	2,228,325	95,005,808
June 1, '76, to Feb. 1, '77	1,876,768	77,127,293
June 1, '75, to Feb. 1, '76	2,177,867	82,261,854
June 1, '74, to Feb. 1, '75	1,847,495	33,378,143
June 1, '73, to Feb. 1, '74	1,843,638	30,574,206
June 1, '72, to Feb. 1, '73	1,588,827	66,242,758

COTTON has fluctuated sharply and closed firm.

Latest prices are for January, 10.05@10.07c.; February, 10.02c.; March, 11.12@11.13c.; April 11.27@11.28c.; May, 11.39c.; June, 11.52c.; July, 11.59c.; August, 11.64@11.65c.; September, 11.37@11.39c.; October, 11.16@11.18c.; November, 11.03@11.05c.

Quotations for spot cotton are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted.

	Uplands.	*Ala.*	*Orleans.*	*Texas.*
Ordinary	8¾	8¾	8¾	8¾
Strict ordinary	9 5-16	9 5-16	9 7-16	9 7-16
Good ordinary	9 11-16	9 11-16	9 13-16	9 13-16
Strict good do	10 3-16	10 3-16	10 5-16	10 5-16
Low middling	10¼	10¼	10¾	10¾
Strict low middling	10 13-16	10 13-16	10 15-16	10 15-16
Middling	11 1-16	11 1-16	11 3-16	11 3-16
Good middling	11 7-16	11 7-16	11 9-16	11 9-16

Middling fair	12 3-16	12 3-16	12 5-16	12 5-16
Fair	12 11-16	12 11-16	12 13-16	12 13-16

Stained.

Good ordinary, 8¾c.; Strict ordinary, 9¼c.; Low middling, 10c.; Middling, 10¾c.

DRIED FRUITS.—Apples of choice quality are firm in price, and have a fair inquiry. Peaches are very dull. Small fruits are generally scarce and firm.

Apples—State quarters, old, 6@6¼c.; new, 16@6¼c.; Western quarters, old, 6@6½c.; new, 5¾@6½c.; Southern, new, prime sliced, 7c.; fair to good, 5@5¼c. Peaches—Peeled, new, 10@10c.; unpeeled halves, 4¾ 5c.; unpeeled quarters, 4@4c. Pitted cherries, 16@17c. Blackberries, ?@10c. Raspberries, 27c. Plums, 16c.

EGGS.—Receipts for the week, 4,307 barrels. Real winter weather has come to the relief of the hitherto dull and depressed egg market. Prices have stood an advance without a stoppage of trade, and if receipts continue small and sellers do not become too avaricious, the useful portion of the surplus will be closed out. Some held stock is so low in quality, that it will be almost impossible to sell it out. Limed are a shade better, following the advance in fresh.

Near points, 19@20c.; State and Pennsylvania, 19c; Canadian fall 13@15c.; Western best, 18@18½c.; other, 13@16c.; Southern, 18@16½c.; Limed, State, 12@14c.; Canada, 12@14c.; Western, 10@13c.

FEATHERS.—Live white prime Western geese, 45@47c.; mixed, 30@40c.

FEED.—Is more freely offered and easier. Sales 40 pounds ave. $20.00@20.50; 60 pounds ave. $19.50@20; 80 pounds ave., $20@21; 100 pounds, $20.50@22; and rye at 19@20.

FLOUR.—Export trade has been lively, and home demand moderate. On account of the large stocks there are free sellers at easier prices.

Latest prices are $3.90@4.75 for poor to fancy superfine State; $4.90@5.25 for common to fair extra do; $5.45@5.75 for good to choice do.; $4.25@5.00 for superfine Michigan, Indiana, Iowa, &c., outside for choice; $5.00@5.45 for shipping extra do., the inside price for poor, and $5.45@5.75 for good to strictly fancy extra do.; common to choice white wheat extras, $5.75@7.25; fancy do at $7.25@8.25; red and amber winter wheat, good to choice family, at $5.10@6.85; round hoop Ohio at $5.10@5.50, and trade brands of do. at $5.75@7.00, the latter for choice; St. Louis, $5.00@6.25 for poor to fair extra and $6.25@7.50 for good to fancy, (with a few brands of very fancy quality quoted up to $8.00@8.25); Minnesota clear, $5.00@6.50; Minnesota "straights," common to fancy, at $6.00@7.85, and patent poor to very choice, $6.70@9.00, with a few fancy at $9.25@9.75; unsound stock at $2.10@6.25; city mill extra at $5.00@6.85 for fair to very choice for West Indies; do. for England $5.00@5.15; do. trade and family extras, $6.65@7.75; do. South America, $6.00@7.50; No. 2 at $2.50@3.75.

Buckwheat Flour—Quoted at $2@2.60. Corn meal is selling at $2.60@3 for Western yellow and $3.20 for Brandywine.

FRESH FRUITS.—Exports of apples past week, 767 bbls. Prices have become too strong to admit much exportation. Sales are not large, but fine quality is well concentrated, and selections of any variety are quoted at $4.50@5; fair to good, $3.50@4; poor, $2.50@3. Cranberries are firm—few further arrivals expected from New Jersey. Fine crates and bbls. are higher, poor stock slow. Fancy bls., $7.50@8; do, crate, choice, $2.60; good, $2.12@2.25; fair, $1.@1.75, poor to good bbls., $1.50@6.75. Florida oranges scarce and firm at $3@5 ₱ case. Grapes dull at 6@7c. for sound Catawba. Peanuts have lost all of their recent firm tone—which was, however, a speculative one—and with a dull demand and liberal offerings of stock, prices are lower. Best hand-picked Virginia, $1.40@1.45; good to fancy, $1.20@1.35; common, $1@1.15. These low figures do not represent large sales. Hickory nuts, 75c.@$1.

FURS AND SKINS.—Some special call for a few common or fair commercial grade skins has given a little better change in prices. But as a rule the market is quiet. Manufactured stocks will be largely carried over this season.

Skunk, black		50@ 60
striped		7@ 30
Wolf, mountain		1 50@ 2 00
prairie		50@ 60

GRAIN.—All articles have been lower, on the peace news, but a better export trade results.

Latest sales are of No. 2 red at $1 26@—ungraded red and amber State, $1 10@1 40; white, $1 41; No 1 Northwest spring, $1 32; No. 3 Chicago, $1 20½; No. 2 red for January at $1 26; No. 2 Milwaukee spring, $1 28. Rye is a trifle steadier; sales of Western at 70@71c.; State at 73@75c. Barley, 96c for No. 1 Canada; 86@86c. for six-rowed State. Corn is weak and quiet. Latest sales are of New York No. 2 at 59½@60c.; steamer mixed, February, 54@54½c. Oats of New York extra white, at 34½@35c.; do. No. 1, February, 35½c.; No. 2 white, 36@36½c.; mixed Western, 36@37½c.; white Western, 37@39½c.

HAY AND STRAW.—There is a fair shipping demand, and home trade is steady, with prices unchanged. Straw is in good demand by the presence of snow.

Bale hay, 65@70c. for shipping, and 75@85c. for retail qualities; clover, 40@50c. for prime. Straw, 50@65c. for long rye; 44@50c. for short rye, and 40@45c. for oat.

Exports last week, 2,335 bales; since Jan. 1, 5,920; same time last year, 8,585.

HIGHWINES are higher, on account of revenue agitation—$1.09.

HONEY.—Continues dull. White clover, 2-comb boxes, has sold at 13@15c., and good dark at 8@10c.

HOPS.—Exports for the week have been 2,550 bales. Aside from this there have been but little done, the trade from brewers being restricted by the excise question. Prices though not lower, as a rule, have been easy on grades from 6 to 10c.

State choice to fancy, 11@13c.; good to prime, 8@10c.; do., low and fair, 5@7c.; Eastern, new, 5@8c.; Wisconsin, do. 5@8c.; Yearlings, 3@5c.; Olds, all growths, 2@3c.; Californians, 12@14c.

LEATHER.—Hemlock sole, 20@22c. for light, 21@22½c. for middle, 21½@23c. for heavy, 19½@21c. for good damaged.

OIL-CAKE.—Western is quoted at $31 ⅌ ton.

POULTRY AND GAME.—Supplies of live have been moderate and price fairly steady. Ducks and geese have sold better.

N. J. chickens, 8@9c.; W. fowls, 7@8c.; Turkeys, 9@10c.; Toms, 6@8c.; Ducks, N. J., pair, 55@$1.12; Geese, N. J., $1.75@2.00; Western, $1.12@1.37.

Dressed Poultry.—The market is firmer for fresh lots and were it not for the quantities of old supplies that are being put out from ice-houses, fresh have a better market. The weather is now very favorable and though some parcels are detained by the snow storm, dealers do not look for any of the demoralizing gluts that have ruined the season thus far.

Fancy Phila. and N. J. turkeys, 13@15c.; good, 12@13c.; large or Toms, 7@8c.; chickens, choice, 14c.; good, 10@13c.; common, 7@9c.; ducks, choice, 12@15c.; other, 10@14c.; geese, fancy, 12c.; other, 7@9c. Capons large 18@20c.; small and slips, 15@16c.

Game is scarce and when items are not firm they are steady.

Hares and rabbits, pair, 25@30c. Canvas-back ducks, $1.25@1.50; Red-heads, 75c.; Mallard, 40@50c.; Teal, 30@40c.; Quail, prime, $1.50@1.75; soft, $1.00@1.25. Partridges, pair, 75c.@$1.00. Grouse, 70c.@$1.00.

PROVISIONS.—Hog products have been in active export demand and closed firm. Mess pork, $11¼@11¾ for spot lots; $11.75@11.85 for February and March. Bacon at 5½@6—c. for long clear and 6¾c. for short clear. Lard—Western steam at 7-65c. for spot and February, 7-75c. for March, and 7-85 for April. Stearine, 7¾@8¼c. for prime Western. Beef hams at $16.00@16.50. Beef—New extra mess, $13.00@13.50; plain, $11.00@12.00; new packet, $15.00; family mess, $17.50; extra India mess, $27.00@28.00 for city brands; do. Philadelphia, $28.00.

SALT.—Ashton's at $2.50; Higgins', $2.40 and other sack lots at 95c.@$1.15; Liverpool ground, 65@70c.

SEED.—Clover, 8¼@8½c. for prime: timothy, $1.37½@1.42½. Rough flax, $1.55.

VEGETABLES.—Exports of potatoes past week, 3,715 bbls.; onions, 150 do. The demand is light for potatoes—in fact, the hauling is bad since the snow. Only prime seed sorts for Southern use bring the extreme—$2 in double heads. Onions quiet. Bermuda tomatoes have sold at $3.40 ⅌ box. Florida green peas, bush., $6@7. Squash easier.

We quote Peach Blows, $1.75@2, bulk and double-heads. Early Rose, $1.75@1.87; Peerless, $1.25@1.50; Nova Scotia, $1.50@1.75; Sweet, $1.50@2.50. Cabbages, 100, $2.50@4.50; red, 5@8. Marrow squash, bbl., $1.50@2; Hubbard do., $2.40@2.50. Russia turnips, 75@87c. Carrots, 75@87c. Beets, bbl., 75c.@$1.00. Red and yellow onions, $1.25@1.50; white, $1.25@1.75. Celery, doz., 75c.@$1. Hot-house mushrooms, ⅌ lb., 20@40c. Radishes, 100 bunches, $@3.50. Lettuce, mall, dozen, 75c.@$1; large, $1.50@$2. Cucumbers, doz., $3@4. Rhubarb, doz., $1@2.

WOOL.—There has been a very slow market, but prices are not changed, and generally holders are confident.

Latest sales are of X Ohio fleeces at 45c.; X and XX at 43@46c.; low Wisconsin, 41c.; Ohio combing, 54@58c.; Georgia, 30c.; Utah, 20c.; fall California, 16½@26c.

LIVE STOCK MARKETS.

NEW YORK, Feb. 4, 1878.

BEEVES.—Receipts for the week, 7,445 head: do., last week, 8,444 do. The recent snow storm interrupted the delivery of stock, and the light receipts found ready buyers at an advance of ¼@½c. over last Wednesday's rates. Selected stock, such as tops of droves and bunches that exactly suited certain buyers, brought 11@11½c.; prime, 10¾@10¾c.; after these the range was 8¾@9¾c., with 10c. made for even, tidy butchers' cattle. The lowest rate represented Texas. Rough State stags sold at 4¾c., live weight. Wholesale buyers are not purchasing liberally for immediate slaughter, as a good quantity of dressed stock, including Western, is on the market. The weather of February favors trade. No new sales for export.

COWS AND CALVES—Unchanged. Good ones might sell, and poor ones will not. This means a nominal market, as few extras arrive at this time of the year.

VEAL CALVES.—There were few fresh arrivals of live. Rates for milk-fed were 7¾@8¾c. for good to choice; other, 6¾@7¾c.; grassers, 2¾@3c. Hog-dressed calves, fair to prime, 9¾@11c.; grass-fed, 4@5c.

SHEEP AND LAMBS.—Receipts for the week, 17,301 head; do., last week, 15,793 do. The market has been quiet since the storm at Jersey City; at 60th St. sales were brisk and firm at following figures. Quality of general stock not fine. Quotations for sheep, 5@5¾c. Lambs scarce and nominal.

SWINE.—Receipts for the week moderate; late trains detained. Good 180-lb. Ohio, $4.70@4.75 ⅌ 100 lbs. Country pork firmer; 4¾@6¾c. ⅌ lb., for light to heavy.

ADVERTISING RATES:

TO PREVENT THE HAIR
from Falling Out, to encourage its growth, and to give it an attractive appearance, use Dr. Jayne's Hair Tonic. A useful toilet article, and a safe remedy for diseases of the scalp.

Reading for the Young.

MILKING TIME.

EVA EDGERTON.

THE pearly dew is sparkling
On the clover blooms so sweet,
Falling in tiny showers
At the passing of light feet.
The robin trills a prelude
To the fresh-faced maiden's song,
As, with tripping step, she hastens
The grassy lane along.

No belle of Saratoga
Can look so sweet and fair
As this blooming, country lassie,
With her bonnie, rippling hair.
No laggard in the morning,
No idler poor is she,
As she does her tasks so bravely,
With a step both light and free.

Life to her is worth the living,
The future, grand and sweet.
To be is *her* endeavor,
Fulfillment she will meet.
A bonnet or a feather
Will not satisfy *her* heart;
Something higher than mere fashion
Can to her true joy impart.

'Tis this simple, true-souled maiden
That knows the worth of life,
That makes the model woman,
That proves the truest wife.
Boys, would you find a treasure
That's worth a silver mine?
Then choose one, when you see her,
At the hour of milking time.

A NOVEL COMPETITION.

IT gives me great pleasure to endorse the idea of a valued contributor. I am sure "darning" is not profanity, therefore I shall be excused if I say hooray! for that "darned" pair of stockings which carries off the prize. My dear nieces the eyes of the community are upon you, and darned be she who first cries holes enough! (Some of this is Shakspeares, the rest my own.) Without more ado I introduce you to Miss ROSE GERANIUM, who wishes to speak about

A "Little Housekeeper."

Quite a long time ago a certain idea, which at the time we thought original, began to grow in our fancy.

One evening while we were sitting alone by the winking, blinking coal-fire, it occurred to us to offer the little folks some prizes for the best exhibitions of their skill and painstaking in home industries. The idea was very pleasant but procrastination, that sly villain, got possession of us and, e'er we were aware, some more practical persons walked off with our pet idea. Alas! If we did not lead, we may at least follow.

We all—or at least some of us—know how very disgusting it is to see a foot in a stocking that has an unsightly rent in it! Why, when we used to go to a certain little white school-house, during the bright spring months, how we were shocked!

Sometimes a girl would be so unfortunate as to get a thorn or gravel located inside her shoe and there would have to be a committee for investigation. Ugh! how many times we have blushed for those untidy girls who perhaps never thought of blushing for themselves!

However, the ill-kept ones were only the exceptions. The rule was dozens of pairs of the daintiest, daringest, cutest white feet. Some of them used to go quite without shoes and stockings and then we had grand opportunities to study pedal character! There is great variety and expression in feet. We have known persons who could speak more emphatically and energize more effectually with this member than with any other.

Especially was it the case with the old local preacher—school-master. He rarely scolded any other way. If it had not been for the eloquence of his descending heel the youth of our community might have waxed lawless and desperate. Dear old man! He had a most brigandish pair of black eyes and was crowned with a hirsute glory that fairly bristled in moments of wrath. To this day we fail to understand why they were so powerless in the bloodless fray!

There was another foot to which we would fain fling back an affectionate tribute. It was the happy associate of a boy's brown ankle and was the most witty representative of its race we ever knew. It fairly excelled in conversational gifts. If it had gone out with BARNUM his educated pig would have been but a secondary attraction! Why, it could perform all sorts of ballroom evolutions, express admiration, discord or defiance, sing popular airs; weep, run away in horror-stricken fright, or fling paper balls and coal-cinders at the master's cranium. If he dared cast a suspicion upon the associated hands, which were always clasped meditatively over the outspread page, that foot would unfailingly vindicate their innocence in a proclamation as long as the neighboring sand-washes would contain!

One poor little pair of feet used to appeal to us with words that seemed to say:—"Give blue-eyed Janie part of your dinner!" You may be sure, my dears, the request was never denied.

But we must not forget what we commenced to write about. We are going to offer the little girls whose parents take the RURAL NEW-YORKER a prize—not for composition writing or puzzle solving but—for *hose-darning!* We feel very certain that a good habit acquired in girlhood is not likely to be lost or neglected as one grows older. If our small maidens learn how to do this one little task neatly and daintily they will not only be able to help mamma when she requires it, but they will have at their fingers' ends an accomplishment some grown persons do not possess.

The only terms we exact are that you must not be over eleven years old and must do the work entirely without assistance. To the one who sends the neatest work we will mail a little collection of very beautiful, hardy plants.

You can have until the 20th of March to send in your specimens. Please address them to your friend, ROSE GERANIUM.

Sycamore Dale, W. Va.

A FISHY TRANSACTION.

BY A FISH.

ONE striking difference between dreaming and being awake is that in the former state nothing surprises you. No matter how extraordinary your adventures, or how impossible the circumstances in which you find yourself, you accept them as coolly as if you were discussing your neighbors' misfortunes. It was for this reason, I suppose, that I did not experience the slightest astonishment on finding myself transformed into a salmon. Stay, "transformed" is hardly the word, because I was myself as well as the salmon. I remember I wanted to sit down, and was much troubled because I couldn't; also, I wanted to take out my watch, and see what time it was. "Transmigration," again, will hardly express what happened to me, for I was not merely a human soul in a salmon's body. I wound up my dream by dining off myself—without either lobster-sauce or cucumber, which in my two-fold nature I regarded both as a slight and a misfortune. Suppose, then, we say I found myself amalgamated with a salmon; or, rather, that a salmon became my *alter ego*, or other self. This is much nearer the mark, but it is not quite right yet.

For I was distinctly salmon in shape, and distinctly man in thought, though some of my organs performed very unsalmonlike feats, and some of my appetites were woefully inhuman. For instance, the first thing I did was to glance admiringly down my rainbow back and silver sides, which a real salmon could not do; and, a little later on, I found myself making a hearty meal off a few hundreds of my own young, which a man would never think of. Nevertheless, when I came to pick my teeth, I found my hand a fin; and when I became enamoured of a choice young beauty of my tribe, I was afflicted with a strong desire to eat her. At the same time, let it be understood that in my dual nature I was conscious of being a highly superior and responsible fish.

I knew that I belonged to the proudest aristocracy of the oceanic polity; we were privileged only to be taken in certain specified ways at certain specified times of the year; that, when we were taken, we were destined to be eaten by those only who could afford to serve us up nicely; and finally, that we of the particular river I had fixed upon as the scene of my inland excursions, furnished forth every year something like eight hundred thousand pounds of food for the population without costing a penny in breeding and rearing beyond the sums spent in protecting us according to law. Add to this that I was a very large and very handsome fish of my kind, and that I had a fine family, numbering somewhere about ten millions—whom, as a salmon, I regret to say, I cared nothing about, but whom, as a man, I was sorely desirous of bringing up in the paths of virtue—and you will at once see that I was a being of high distinction and importance.

Propelled through the silent, glittering water by my tail (to which I found all the stronger muscles of my body tended,) and balancing and guiding myself in graceful curves by my pectoral and ventral fins (which I found to correspond anatomically with the arms and legs of the human body,) I sailed past salmon-trout, bull-trout, and the "lower orders" of salmon generally, with majesty—bestowing upon them, indeed, a gracious inclination of the head if they made due obeisance, but otherwise giving them the go-by with a seeming dignified unconsciousness of their existence. It is true I had an uneasy remembrance that when I was a parr—for, unlike what obtains in human affairs, the parr is a child instead of a father, and being an old salmon, I had passed through all the preliminary stages of parr, kelt, salmon-peal, and grisle—I had, I say, an uneasy remembrance that when I first came into the world I had often been caught with and mistaken for the offspring of these "lower orders" and thrown into the water again. But I was a real salmon now, and was determined not only to keep my position, but to make it felt. So, as I say, I sailed past all sorts and conditions of inferior fry with obtrusive majesty, or at the most, if I felt in a particularly playful humor, would condescend to dart suddenly amongst a shoal of them with my terrible curved lower jaw—a deadly weapon of offence carried by old male salmon—ready for action, and scatter them to all points of the compass at once. I did not do this often, for the peculiar construction of my mouth forbade laughter, and inward convulsions of merriment were likely to inconveniently disarrange my gill-fringes.

With my experience as a salmon, and my knowledge as a man, I found these gill-fringes a fruitful subject of investigation and study. They were my breathing apparatus—I say advisedly "breathing," for fishes do not live upon water, but upon air. As regularly as a human being respires, I opened my mouth and closed it again, taking in at each gulp about a pint of water, which, with the aid of four pairs of bony plates, I shot out through my gill-fringes with this difference in its constituents—that whereas it passed in at my mouth full of air globules, it passed out at my gill-orifices, leaving every air-globule behind it to supply my blood with oxygen and so sustain my life. I then knew that the huge forests in old ocean were as necessary to fish-life as vegetation upon the earth is necessary to other animal life, and that the great winds which wreck ships are vital to the myriads of creatures that live beneath the waves; and I determined that when I ceased to be a fish—for by a kind of dream within a dream I knew that this must happen shortly—I would take the first opportunity of advising such of my friends as keep aquaria to be very particular that their tanks are well supplied with plants, and periodically aerated.

The general construction of my mouth astonished me nearly as much as the construction of my gills. Not only had I teeth all round my upper and lower jaws—not fitted in like human teeth, but forming part and parcel of the bone itself—but I also had two rows on my tongue, and a few in the roof of my mouth. And I found this arrangement very convenient; for it must be remembered that my mouth was the only thing about me with which I could lay hold upon my prey, and I was terribly voracious, eating fifty or a hundred small fry at a meal. Not that I confined myself to small fry; I could eat almost anything, from trout-fly or the eggs of shell-fish, to a good-sized herring. And it was when engaged in munching these latter gentlemen, that I found my supplementary teeth most useful—I could hold the rascals between my tongue and the roof of my mouth while I opened my jaws for a renewed bite. Another thing that pleased and surprised me was the rate at which I could sail through the water. I could do my thirty miles an hour for an hour or two easily, though I did not usually travel more than ten or twelve—sometimes not that.

And now I approach the end of my adventure as a fish. I had gone up and down my river regularly season by season, until I knew every cataract in it, and had become so expert in leaping, that the salmon-ladders kindly placed up some of the weirs to help us over our difficulties, were to me useless. I had even become so accustomed to the ways of salmon anglers that I had playfully swallowed a bait or two on my way down stream in the kelt state, to see what being caught was like, well knowing that as soon as I was taken I should be thrown in again with disgust. But one day, I don't know how it was, I found myself lying upon the bank. The next thing I remember was that I sat at table dining off myself with relish, and the next that I woke up in my easy chair with a yawn and a kind of dim consciousness that on the whole, I had had a very strange dream.

The Puzzler.

MISCELLANEOUS ENIGMA.

I AM composed of 41 letters:
My 13, 28, 32 has been very scarce this winter.
My 28, 40, 1, 33, 41 what my 28, 25, 13, 15, 39, 21, 32, 30 like.
My 4, 15, 36, 6, 25, 29, 35 an animal.
My 23, 9, 5, 18 an insect.
My 6, 20, 2, 27, 12, 41 not ugly.
My 11, 17, 34, 14 one who has not much brain.
My 26, 35, 8 a busy little insect.
My 23, 22, 38, 14 an important constituent in the manufacture of our clothing.
My 24, 13, 1, 36 a kind of drink.
My 10, 19, 6 a fancy young man.
My 31, 7, 31 what small boys are sometimes called.
My 3, 37 the abbreviation of one of the United States.
My whole is an old and good saying.
☞ Answer in two weeks. LUCY.

CROSS-WORD ENIGMA.

My first is in Loire but not in Tagus,
My second is in Potomac but not in Indus;
My third is in Patapsco but not in Seine,
My fourth is in Raritan but not in Tyne;
My fifth is in Jordan but not in Moser,
My sixth is in Thames but not in Tiber;
My seventh is in Boyne but not in Oder,
My whole is a river often fought over.
☞ Answer in two weeks. BALTO.

QUADRUPLE CROSS-WORD ENIGMA.

My first is in checkerberry but not in anise seed,
My second is in cantharides but not in flower seed;
My third is in nectarine but not in camphor gum,
My fourth is in strawberry but not in egg plum;
My fifth is in citron-melon but not in thyme,
My sixth is in nannieberry but not in lime.
My whole form four kinds of fruit.
☞ Answer in two weeks. FLORIDAN.

PUZZLER ANSWERS.—Jan. 26.

HIDDEN BIRDS.—1, Ostrich; 2, Swallow; 3, Blackbird; 4, Raven; 5, Woodcock; 6, Pheasant; 7, Partridge; 8, Snipe; 9, Cockatoo; 10, Woodpecker; 11, Paroquet; 12, Cuckoo; 13, Bluebird; 14, Hornbill; 15, Dodo; 16, Goshawk; 17, Petrel.

ENIGMA.—Drum.

CHARADE.—Artless.

BURIED ENGLISH CITIES.—1, Ellon, Lyons, Bute, Ware; 2, Ayr, Dover, Bath, Stone, Oxford; 3, Leith, York, Oldham, Perth, Boyle, Ely.

Sabbath Reading.

SLEEP.

O GENTLE sleep! the gracious gift and blest,
Of God's own sending;
O sacred sleep! dear foretaste of that rest
Which knows no ending;
Sweet promise of that far-off Paradise
Of calm release,
Where weary ones may lean on Jesus' breast,
And close their eyes,
And be at peace.

Earth "presses down;" the hearts that would ascend
Droop, faint and weary;
So distant seems the lifelong journey's end,
The way so dreary;
Each day's fierce struggle tires us out as though
We could no more,
Then comes thine handmaid, Sleep, our griefs to tend,
With balm for woe,
And strength in store.

We lay us down in peace,—thy touch divine
Our eyelids closing;
Darkness,—thy secret place,—becomes the shrine
Of our reposing;
Gently we breathe our souls into thy care,
So glad to be
One day more near to that home-rest of thine,
Which we may share
With saints and thee.

So night by night we linger at thy feet,
Until the morning;
Glimpses of heaven, bright visions pure and sweet,
Our dreams adorning;
And if thy voice, kind Lord, we seem to hear,
That word most blest
For willing souls, with sympathy replete,
Falls on our ear,
"Sleep,—take your rest!"

[*Genevieve Irons.*

IMMORTALITY OF THE SOUL.

BY OLD JONATHAN.

AN eminent divine was once trying to teach a number of children that the soul would live after they were dead. They listened, but evidently did not understand it: he was too abstract. Snatching his watch from his pocket, he said:

"James, what is this I hold in my hand?"

"A watch, sir. "A little clock," says another.

"Do you all see it?"

"Yes, sir."

"How do you know it is a watch?"

"It ticks, sir."

"Very well. Can any of you hear it tick? All listen now."

After a pause, "Yes, sir, we hear it."

He then took off the case, and held the case in one hand and the watch in the other.

"Now, children, which is the watch? You see there are two which look like watches."

"The littlest one, in your right hand, sir."

"Very well. But how do you know that this is the watch?"

"Because it ticks."

"Very well again. Now I will lay the case aside—put it away, there—down, down in my hat. Now let us see if you can hear the watch tick."

"Yes, sir, we hear it," exclaimed several of the children.

"Well, the watch can tick, and go, and keep time, you see, when the case is taken off and put away in my hat. So is it with you children; your body is nothing but the case, the soul is inside. The case, the body, may be taken off and buried in the ground, and the soul will live and think, just as well as this watch will go, as you see, when the case is off."

This made it plain, and even the youngest went home and told his mother that his "*little thought would tick after he was dead.*"

THE VALUE OF A MINUTE.

A SMALL vessel was nearing the Steep Holmes in the Bristol Channel. The captain stood on the deck, his watch in his hand, his eye fixed on it.

A terrible tempest had driven them onward, and the vessel was a scene of devastation. No one dared to ask, "Is there hope?" Silent consternation filled every heart, made every face pale. The wind and the tide drove the shattered bark fiercely forward. Every moment they were hurried nearer the sullen rock which knew no mercy—on which many ill-fated vessels had foundered, all the crew perishing.

Still the captain stood motionless, speechless, his watch in his hand. "We are lost!" was the conviction of many around him.

Suddenly his eye glanced across the sea; he stood erect; another moment, and he cried out, "Thank God! we are saved, the tide has turned; in one minute more we should have been on the rocks!" He returned his chronometer, by which he had thus measured the race between time and tide, to his pocket; and if they never felt it before, assuredly both he and his crew were on that day powerfully taught the value of a minute.—*Children's Hour.*

MANY a Christian has been made worse by the good things of this world; but where is the Christian that has been bettered by them?

GOD thrusts many a sharp spear through many a sinner's heart, and yet he feels nothing, he complains of nothing; these men's souls will bleed to death.

COLD prayers shall never have any warm answers. God will suit his returns to our request; Lifeless services shall have lifeless answers. When men are dull, God will be dumb.

PERSONAL ITEMS.

Colonel Robert Ingersoll says he made $20,000 by his recent lecture tour.

The Hon. "old Ben" Wade, who is now seventy-seven years of age, is suffering from disease of the kidneys, and his friends feel great anxiety on his account.

Shack Nasty Jim, the once famous Modoc, has raised 1200 bushels of corn, and wants to learn the process of preparing it so that it may be eaten out of a flask.

Such are time's changes that a Napoleon has lately been the guest in England of a Wellesley, the ex-Prince Imperial having been staying with the great Duke's grandnephew, Lord Cowley, at his seat, Draycot, in Wiltshire.

The Queen of the Gypsies, Mrs. Matilda Stanley, whose authority as such is recognized by all the tribes in the United States and Canada, died a few days ago in Vicksburg, Mississippi. Her remains have been taken to Dayton, Ohio, where her "family" owns much real estate.

W. E. Chandler, who charges President Hayes with bargaining with the South, is about the medium hight, but very slender and insignificant in appearance. He has a small head, garnished with dry, light hair; small gray eyes, partially hid behind glasses; a rather weak face, with a beard that seems to be apologizing for its appearance that is bad.

When the Duke of Edinburgh was in New Zealand, he was introduced to the Rev. Mr. Piaratanatissatarrunanse. But that clergyman, writes Mr. Conway, must hang his head at the curtness of his name, if his eye should alight on the report of the trial of a clerical brother in Wales for obstructing a highway. The defendant is described as the rector of Llanfairpwllgwyngllgogerytysilliogogogoch.

The home of Mr. Thurlow Weed, the veteran politician, in New York, is a pleasant but not pretentious house, situated at the corner of Twelfth street and Fifth avenue. The only notable things about it are a large flag staff projecting above the door, and a beautiful display of rare hot-house flowers in two or three windows. Mr. Weed seems very fond of flowers, for the window conservatories are kept up all the year round.

Ex-Gov. Young of Ohio, and Governor-General Dufferin of Canada, happened to meet at a reception in the White House on the 28th ult. The ex-Governor was born on the estates of Earl Dufferin's father, in the north of Ireland. There is only a difference of two or three years between the ages of the Earl and Mr. Young, and a pleasant hour was passed together by the two gentlemen in recalling reminiscences of their youthful days.

The Strohl family of Mauch Chunk, Pa., is probably the largest in the United States. Nicholas Strohl is a Pennsylvania German, now 76 years old. By three wives he has had thirty children, twenty-seven of whom are living. The youngest child is now three years of age, and was born when its father was 73 years old. Nineteen are married, and their families average eight children each. At a family gathering they numbered over 200.

A modern "Robinson Crusoe" owns and occupies Quiros Island, a neighbor of the Samoan group, where he has lived for over thirty years. He is an American, Eli Jennings by name, and has a Samoan wife and many olive branches. The island is about three miles long and from one to one and a-half wide, and is some 200 miles north-northeast of the Samoan group. The patriarch is well-to-do and happy as a lord, and verily he is monarch of all he surveys.

The family of which United States Marshall Frederick Douglass was a slave in his younger days, has always kept with him the most kindly relations. Mrs. Sears, of Baltimore, is the daughter of his former master on the Eastern Shore of Maryland. Her husband a few days since sent the following dispatch: "My wife is dying, and wishes to see you; come immediately, if possible." Mr. Douglass was affected to tears, and obeyed the summons at once.

General Diaz is a very unostentatious man, and lives within his moderate means. The White House at Washington is a palace compared with the simplicity of his surroundings. It has, like all Mexican houses, a large court-yard, and is two stories high. There are no soldiers nor flunkies to bar the way. The general is a man of fine presence, every inch a soldier, tall and straight, rather spare than corpulent. He wears his thick dark hair closely cut, a medium-sized moustache overshadowing a clean-shaved chin. He is a man of about forty years of age. His manner is cordial, and bears, like his face, the impress of boldness and frankness. In fact, there is a magnetism about the man which, perhaps more than anything else, has raised him to his present eminence, and is the cause of his great popularity.

Coughs and Colds.

"Brown's Bronchial Troches" will allay irritation which induces coughing, and gives immediate relief in Bronchitis, Catarrh, Influenza, Hoarseness, Sore Throat, and Consumptive and Asthmatic Complaints. The Bronchial Troches have been steadily winning their way into public favor, until they are known and used nearly all over the world.

PARTICULARLY
FOR THE LADIES!

THE RURAL NEW-YORKER, at the instance of Miss FAITH RIPLEY, conductor of the Department "For Women," offers, as one of the most valuable and acceptable Premiums of the season, a Steel-Plate Engraving, size 24x32.

The subject,

"OUGHT AND CARRY ONE,"

portrays a pretty young girl, gracefully poised, and holding pressed against her side, a slate on which she is "doing sums." The contracted brow, puzzled expression and drawn corners of the mouth, express most comical dismay.

This charming picture is printed from a new plate, the lights and shadows are clearly defined, and this work of art, when nicely framed, is a decided ornament.

Nothing is more refining and elevating than *good* works of art, and we confidently proffer this as something greatly in advance of anything heretofore announced.

We anticipate that this offer will appeal especially to our lady readers, and in order that the picture may be placed within the reach of all, we have scaled the club so low that it partakes more of the nature of a gift than a premium.

5 SUBSCRIBERS AT $2 EACH,

will entitle any one to the Engraving.

For specimen copies and outfit for canvassing, address

RURAL NEW-YORKER,
78 Duane St., New York.

Implements and Machinery.

THE PATENT NAPKIN HOLDER,

Since its introduction, has met with an enthusiastic reception, and seems to meet a want long felt by every one. The parents buy it for their children, while gentlemen and ladies all over the country write, as soon as they receive and use the sample, that they "are so much pleased with it, they want more for themselves and friends." It holds a napkin or bib in place, so that the clothing is entirely protected. They are made of the finest quality of nickel silver, heavily plated with pure silver, and are connected with a heavy silk cord. They are also used very successfully as a skirt supporter, fastening on anywhere, and without injury to the most delicate fabric. The cut is shown one-half size, while that of the boy illustrates the method of use. Price per dozen, $3.00 by mail, postage paid; or a sample one will be sent on receipt of 25 cents. SPECIAL TERMS TO LIVE AGENTS, LADIES OR GENTLEMEN. Manufactured only by

THE NEW ENGLAND PLATE COMPANY, New Haven, Conn.

Matthews' Garden Seed Drill,
Matthews' Hand Cultivator,

Matthews' Drill & Cultivator combined, surpass all others. Send for Circular before you buy.

Manufactured only by
EVERETT & SMALL,

TO PUBLISHERS.

THE RURAL NEW-YORKER has accumulated a very large number of desirable Wood Cuts, Electrotypes, etc., representing illustrations that have appeared in this journal from time to time. We have had numberless inquiries from publishers, asking our terms for such cuts as were desirable to them; but we have never, until the present time, had them arranged in a manner that made them easy of access for reference.

We are now prepared to fill orders for these Cuts, and as we do not care to do more than secure a part of the first cost of the pictures (having used them once), we shall make the prices very low. Similar Cuts cannot be bought in New York for less than 20 cents per square inch, and from that price ranging up to 50 cents, according to the quality of the work.

We now offer any Illustration appearing in the RURAL NEW-YORKER, at the following price, delivered in New York:

TEN CENTS PER SQUARE INCH.

All expenses of postage or expressage must be borne by the purchaser.

This rate is so low that we cannot undertake to furnish proofs of Cuts, or do anything that will cause extra expenditure of time, labor and postage on our part. Intending purchasers should indicate the Cuts and date of papers in which they appeared. On receipt of this information and the cost of the Cuts (where the parties are not known), we will immediately fill order.

Farm Topics.

AGRICULTURE AND EDUCATION IN THE UNITED STATES.

PROF. I. P. ROBERTS.

No. 5.

THAT great power of the nineteenth century, the Press, has benefited Agriculture fully as much as any other industry, and far more than it has politics.

The discussion and debate through the press, relating to the industries, have been for the praiseworthy object of arriving at and disseminating facts, and also of correcting error and removing prejudice; while in politics it would seem at times, as though the only object was to gag truth, and promulgate error; not that some possible good might come, but simply to destroy an opponent. Happily he who engages in agriculture has no need to destroy his brothers in order to arrive at eminence in his calling; for his neighbor's prosperity increases his own.

While the press has done wonders in disseminating useful knowledge that otherwise would never have benefited the world, yet it has been the medium through which improvement has been effected, rather than the direct cause of it; but it has been the cause of removing prejudice against "book-farming." All have come to the conclusion that knowledge is none the less valuable, because gained through the medium of a book or a newspaper. But there are certain kinds of knowledge that all the power-presses in the land cannot give us, though they may guide us to it. One could never become a good judge of Shorthorns by simply studying the Herd-books and Stock journals; he must have the living animal before him, that the eye, the hand, and the judgment may be educated; but the rapidity with which this education is acquired will depend largely on his acquaintance, through books and papers, with the experience of others. If this be true, it would appear that for the most rapid advancement, we need not only the aid of the press but also those great educators, the annual fairs.

Because they are sometimes turned into horse trots, and baby shows, is no argument that the day of their usefulness has passed. Instead of abandoning them, correct the abuses that have crept in and diverted them from their legitimate purposes. The social advantages of these yearly gatherings are alone worth all they cost, to say nothing of the information gained and the desire for improvement that is stimulated to fruitful effort. I trust the day is far distant when farmers will cease to meet together for the purpose of acquainting themselves with the greatest successes of their neighbors and of learning the methods by which these were attained.

FARMERS' CLUBS, CONVENTIONS ETC.

I believe there are no organizations that give so much practical and profitable information for so little cost as some of these local organizations. John Doe of Kentucky publishes an admirable article on corn culture, but it may cause Wm. Smith of Mass., to make some expensive mistakes; for many of Doe's theories may only be applicable to a small extent of territory, possibly not larger than a township, or at most, a county. Therefore, local organizations are of the utmost importance as practical educators; for the successes or failures of one man, if the causes that produced them are explained, are of great value to his neighbor, because their circumstances and surroundings are so nearly identical.

The great advance in agricultural literature has materially injured the local clubs through no fault of the papers but rather of those who read them. The old saying transposed, I think, would be applicable here; "no great gain, without some little loss." It is so much easier to sit by the fire and read, than to go a mile or two in the cold and participate in discussions! The fact appears to be lost sight of that the benefits derived from participation in the meetings are of great value, though no new facts are acquired of local application. I have spoken at length of the small local organizations, because there is great danger of their becoming extinct, which, in my opinion, would be a great calamity; for they are to the larger organizations what the district schools are to the academies and colleges.

As to the larger bodies, such as the State Agricultural Society, Dairymen's Association, Patrons of Husbandry, Horticultural Society etc. I need not speak at length, for they are so well organized and their usefulness is so well understood and appreciated, that there is no one but that bids them God-speed. I am neither a prophet nor a son of a prophet, and therefore cannot predict to a certainty what is in the future; but it is the part of wisdom to look back over the past, that we may be enabled to learn something of the probabilities of the future. I may be of too sanguine a temperament to judge wisely, but when I compare the period of my early boyhood with the present, as to education, methods and results; as to comforts, enjoyment and wealth; as to dignity, morality, and temperance of the rural population, I can but believe that the future has greater prosperity, knowledge, and happiness in store.

I am well aware that we are a long way from perfection yet; but some valuable facts have been established, one of which is that ignorance and agriculture, or rudeness and farming are not necessarily inseparable. True, there are a few fossils remaining who are fearful that everybody will be educated off of the farm; but we need not fear, for the fact is only too evident to all, that as education advances in any locality, agriculture improves in the same

HOW TO DO IT.
Dedicated to our Long Island Fox Hunters.

ratio. We will say no bad things of these relics of a pre-historic period; for they are valuable as a sort of unchangable point from which we may reckon our progress. Since we are agreed, I think, that all knowledge is valuable if rightly used, it would appear to be the part of wisdom to devote our energies to perfecting the methods of imparting and acquiring it, rather than of destroying or crippling the institutions already in existance, because all of their methods are not perfect, or because they are not precociously fruitful. When we see the increased comforts, happiness and education of the average farmer of to-day, as compared with half a century ago, we must acknowledge that the influence brought to bear on agriculture has been on the whole beneficial, and the results highly satisfactory. But notwithstanding all this, much remains to be done, and how can it best be accomplished? I believe the surest, and, in fact, the only means is to educate the masses through general and technical instruction.

Government should gather and prepare statistics, and carry on investigations that are too large in scope, or too expensive for States or local organizations, and above all, cost what it may, it should foster the primary public schools, and if need be, compel the States to establish and maintain them in their greatest efficiency. The States should each establish a general central experiment station, and in time, various special local ones as the industries might require.

To do this would cost large sums of money, but so do alms-houses, prisons and jails, but still we have them because they benefit the public. It costs more to try and hang a single murderer, than it would to establish a respectable experiment station; yet we incur the expense, not to reform the man, such a thing is not thought of, but that law-abiding people may have the protection of the government and dwell in safety. But the prisons and alms-houses are filled, not with the educated, as a rule, but with the ignorant; and so it would appear cheaper and wiser to build school-houses than prisons. And finally, as education is our chief national safe-guard, our shortest road to industrial prosperity and surest one to happiness, I claim that every law-abiding citizen has a right to demand of the Government which he has served and sustained, often at the risk of his life, that it place within his reach and that of his children, every possible facility for acquiring education, wealth and happiness.

JOTTINGS AT KIRBY HOMESTEAD.

COL. F. D. CURTIS.

Our winter seems to have begun with spring. To-day we heard the summer birds singing as the rain gently fell, melting away the remnants of one week's sleighing. This rain came most oppertunely, as the cisterns were getting dry and the wells low.

This year is remarkable for heavy hogs. We never knew of so many before. The reason is the mild weather of the fall and the spring-like winter have been most favorable for faltening animals, and then, the price of pork is low and many have fed later than usual, hoping for a rise in the price. We ought to begin feeding earlier. In this section farmers do not generally commence fattening their pork before October. This is two months too late if they would feed to the best advantage; for one bushel of corn in warm weather will actually make more growth than double the quantity in cold weather. Most of the pig-pens are cold, open places, so that a large percentage of carbon is required to keep the animals warm. This heat is furnished from the food, and if there is any surplus after this demand is supplied, then the pig will grow. A cold hog won't fatten. He has got to be warmed up first, neither will he fatten if he is hungry and when he is cold he is sure to be hungry. Warm weather and profit go together. They are mates, and so are cold weather and loss. It is strange that so many farmers think that ears of corn are cheaper to keep out the cold, than hemlock boards, so they stuff their pigs with corn and wonder why they squeal and don't get fat when lumber, at two cents a foot, would keep the wind out of the pen, and a big armful of straw would make a warm nest, and so reduce the cold to a temperature which would make a gain possible. When the mercury in a pig-pen sinks much below the freezing point, profit sinks with it. Four average ears of corn fed three times a day, will keep a breeding sow in good condition in a pen where it does not freeze hard. With such conditions a pig will be well and healthy and a fine litter of pigs may be expected. In an open pen where there are cold drafts, a pig is liable to have rheumatism, quinsy, dysentery, and all other diseases incident to exposure, and colds. No, it does not pay. A pig wants good air to breathe, so does every animal, but it also wants to be kept warm.

Some one, a number of years ago, conceived the idea of having horses wear blankets on their breasts in winter. We thought so well of the idea that we purchased blankets and have used them ever since. They used to be plenty in the country, but now scarcely one is seen. Farmers have got a notion they do more harm than good when horses are traveling on the road. They think they lie against the muscles of the breast, and make it hotter and, when standing, they are blown away by the wind and make the horse wearing them more liable to take cold. There is, doubtless, truth in this. For truck horses and others that stand around in the streets a good deal, they will afford some protection to the breast. It takes but a few minutes for a horse heated up to get a chill in the breast, which is very likely to produce stiffness or founder. The owner is unable to account for it, as he is sure he has not given his horse water when warm or fed him when overheated. Horses will catch cold in the breast while traveling, if they have been heated and are then turned to face a cold wind.

Two Jersey cows which came in last March and are due to calve again in March, are still giving a good mess of milk. They must be dried off this month, as it is unwise to milk a cow up to the time of calving. Cows thus milked, when they come in, will not give as much and the young calf will be thin and weak, unless it may be that the mother has been strongly fed. When allowed to go dry, there is always a renewal of energy and vital force, hence the udder is enlarged, and the lacteal glands are also strengthened and enlarged, resulting in an increased flow of milk. A cow ought, as a general rule, to go dry at least three months, but while the Jersey cows do not give so large a mess, they are persistent, continuing in milk all the time and thus really force their owners to break the rule. We are feeding two new milch cows a heaping half bushel of turnips every day. This is all the extra feed any of our cows get. They have all the hay they can eat three times a day. The turnips impart no perceptible flavor to the milk. The turnips are fed the first thing in the morning and are followed by a generous supply of hay. The turnips are mixed in the stomach with the hay and perhaps their odor is neutralized in this way. The milk is rich and the butter is of fine quality. There is nothing equal to bright, sweet hay as winter food to make good milk. It is, and must be, the most natural and best food. Corn-stalks will produce a good flow, but the milk is not so rich in buttery qualities.

The two bull calves which we shut up in order to give them more condensed food to reduce the capacity of their bellies, in three weeks shrank in circumference seven inches. This reduction makes a decided improvement in their looks. We are now giving them less meal and turnips and more hay. With the lessening in the quantity of turnips, drink is necessary and they get a half a pail of water each, daily. Their hair is glossy, showing a healthy condition, and they jump around like lambs when let out of the stable.

The recent cold snap found the trees full of sap and we are looking for many of them to split open. The weather had been so mild until the cold spell came on, which it did so rapidly, that the trees must be injured, and then it was so cold! From Indian Summer we went to winter and fifteen degrees below zero almost in a night. Such severe changes seldom occur.

Our Canary birds are doing well this winter, living on millet of our own growth, and coarse corn meal, with the particles about the size of a millet seed. The heads of millet are stuck through the bars of the cage and the birds help themselves. They seem to enjoy picking out the seeds exceedingly. Maybe they imagine in so doing that they are free, for so they would do if they were. A handful of millet sown in the oat-field or in the garden, will produce heads enough to feed a pair of birds more than a year. Either the common or the golden millet will answer equally well. We suppose that more than a million of dollars are paid out annually for bird seed. Now, if farmers and those who have a small plot of ground can raise their own seed for feed and add to it a little corn meal, a saving can be made of no small account. Canary birds do not necessarily need the hemp (large seeds) and poppy seeds which are imported for them. For a change the yelk of a hard-boiled egg, chopped up fine and mixed with cracker, is good.

RURAL TOPICS.

T. B. MINER.

NEW BREEDS OF FOWLS.

Whenever a new breed of fowls is heard of in any part of the world, a class of men in this country forthwith import such breeds, and then they are advertised as something wonderful; and they feel such a deep interest in the welfare of the rural public, that they are willing to "spare a few trios at $50 to $75!" This liberal offer is generally made after a large number of fowls has been raised. Now, the most that is said about these new breeds is sheer humbuggery. Note the statements made about the Houdans, Crevecœurs, and La Fleche fowls when first imported, and at what high prices they were sold; and to-day I would not accept a hundred of either breed, as a present, if I were to be obliged to keep and breed them. Then came the "wonderful" Pekin ducks at $20 a pair, and eggs at $10 a setting, which turn out to be no better than several breeds that we had before they were imported; and now we have the "Langshan" fowl, said to have been "discovered in Northern China, by an exploring party!" Not a word of proof is adduced showing these fowls to be worth over 50 cents a piece, yet a breeder of them kindly offers "one trio for $50, and two trios for $90;" but he cruelly adds: "only two trios sold to one person!" Verily, this humbuggery in both new and old breeds of fowls ought to be "played out;" but it is not, and never will be so long as people will throw away their money in buying them.

APPLYING MANURE.

A farmer says that he obtains from 10 to 15 per cent. more wheat, when he spreads his stable manure on the surface of the land, after the seed is harrowed in, than he does when the dung is harrowed in. Now, I claim that such a result is impossible; and the above is, undoubtedly, one of the unreliable statements that some farmers make, without having proved their assertions sufficiently to go forth to the public as *facts*. For instance, one of these farmers spreads his manure on the land and harrows it in as well as he can; and the season is dry, and the result is a poor crop. The next season, he spreads it on the surface of the land, and so leaves it; and the season is rainy, and the result is "10 or 15 per cent." more wheat than the previous crop. Now, what produced this increase? It was not the manner of applying the manure, but the favorable season; yet he straightway writes to his agricultural paper, giving his experience in applying manure, without ascribing the increased crop to the right cause. Scores of such unreliable experiments are published annually in the agricultural press, farmers follow their teachings, meet with failure, and then denounce such writers as "book-farmers."

I claim that manure, to produce the best possible results, should be covered about *two inches* deep, but this is not practicable, as plowing or harrowing it in covers but a small portion of it to that depth; yet if it all could be placed about two inches below the surface of the soil, for all grain and cultivated crops, it would produce much better results than when placed on the surface of the land. Is it not reasonable that a large part of the ammonia of stable dung, when on the surface of the land, *must* pass off into the atmosphere? Suppose we spread a load of stable dung upon a platform, where it is exposed to the sun and air, a month in spring or summer, what would it then be worth? Would any farmer agree to pay 50 cents a load for such dried-up dung? I would rather pay $2 a load for dung while fresh, than 50 cents after the above exposure; and so would any farmer, I think, who uses his reasoning faculties in deciding such a point. I admit that in cases of much rain, not so much of the virtues of manure spread upon the surface of land, is lost; but in all cases a large part of them evaporates.

WESTERN FARM TOPICS,

PROF. E. M. SHELTON.

There is much fear and trembling in the ranks of the ice dealers, caused by the protracted mild weather. Not that mild weather is an anomaly in Kansas winters: far from it; our winters abound in bright, warm sunshine, and days and weeks are not uncommon when wraps and overcoats are superfluous. But usually before February 1st, we have two or three "cold snaps," lasting from a few days to a couple of weeks, in which the mercury goes capering down far below the zero point, and indescribably fierce winds blow, ice from ten to sixteen inches forming in a few days. Our winter weather averages mild and agreeable, albeit should you travel in Kansas in July or January, provide yourself with an Ulster and a fan, a linen duster and a gum coat, for the chances are that you will need them all every two days of your journey.

The past two weeks have been very like the two weeks previous; the temperature of the days has held pretty uniformly between 40° and 59°, three or four rainy days having been had and a total down-pour of one inch of water. The result is, the roads are everywhere abominable, and along the bottoms, quite impassable except on horseback.

A KANSAS ORCHARD.

In the Rural of December 22nd, I read a very instructive article from the pen of Professor Beal, in which a model Michigan orchard is described and the details of its management given. It occurred to me at the time that some of our Kansas orchards need not be ashamed to hold up their heads, or tops, even in the presence of those great Michigan orchards. Comparisons in agricultural affairs, ought never to be odious, for they are usually full of instruction to the farmer.

The particular orchard which I now have in mind, is the property of Mr. Welcome Wells, and is situated in the Kaw Valley, 115 miles west of the Missouri River, and three miles east of this city. This orchard deserves particular mention for three reasons; it is one of the best if not *the* best orchard in a State whose principal crop is popularly supposed to be grasshoppers; it is situated quite beyond what is generally considered the extreme western limit of the fruit-growing area; and finally on account of its thriftiness and very great productiveness. This orchard occupies thirty-five acres of ground and all, except a few trees around the house, were set in 1866. The soil is very rich alluvial bottom-land, having a clayey subsoil, but it is no more fertile than the average of the four or five mile wide strip of Kaw bottoms, that extends 150 miles west of Kansas City.

The first thing that strikes the visitor on entering the orchard, is the low heads and the surprising uniformity of the trees. The clean trunks are rarely more than two feet high, and many not eighteen inches, while every tree is as nearly alike every other, as the individuals in a herd of Devon cattle or Berkshire pigs. This matter of low heads Mr. Wells insists is a vital point to the Western orchardists. The low heads shade the ground, and check evaporation, besides protecting the trunk of the tree from our blazing July suns and scorching winds. Again, the bushy, unpruned heads of these trees appear strange to one accustomed to Eastern orchards. Mr. Wells expresses himself very emphatically upon the subject: "You would kill your trees in a single season," said he, "if you pruned them as trees are pruned in the East; prune but very little," he went on, "and the less the better.

This orchard has the indispensable adjunct of all Western plantations—a "wind-break," and a magnificent affair it is, consisting of three to five rows of trees—Cotton-woods, Black-walnuts, Honey Locusts, Soft Maples and White Cedars—ten feet apart and flanked on either side with a vigorous Osage hedge, all planted at the same time with the orchard, in 1866. The wind-break completely surrounds the orchard, and it is worthy of remark that the best yields and the fairest fruit are obtained next this wind-break on the south side. I saw here Soft Maples that were set out in 1866, and are now great trees, twenty feet or more in hight, having trunks six to eight inches in diameter. I was particularly struck with a double row eighty rods long, of White Cedars the seed of which was sown in 1866, and which have already attained a hight of fifteen and twenty feet, and although the rows and the trees in them are ten feet apart, they now form such a dense mass of evergreen foliage as would puzzle a rabbit to penetrate.

I made several measurements of the apple trees; thus a Wine-sap, a fair average of the orchard, measured twenty-eight feet in the diameter of its top, and its trunk, thirty inches in circumference. Around the house are a few trees of standard Eastern sorts set out in 1861. Of these, a Rhode Island Greening measured forty inches around the trunk, and its top twenty-nine feet in diameter. A Talman Sweet measured forty-three inches in circumference of trunk and thirty-four feet in diameter of top.

The trees in the younger portion of the orchard yielded, the present season, in many cases sixteen bushels of fruit, and in a number of cases, twenty measured bushels were picked from a single tree. In 1876, four thousand bushels of apples were sold from this orchard, in addition to those used in the family and made into cider. The average price in the orchard was $1.25 per bushel. The yield of 1877 has been even better than this, over five thousand bushels having been sold at an average price of one dollar per bushel. Mr. Wells has taken, in the past two years, in cash, from the proceeds of this orchard, no less than $10,000. Do Eastern orchards generally give better results than this?

The great success of this orchard may be attributed: (1) to the selection of sorts suitable to this climate — Wine-saps, Limber Twigs, Ben Davis, Rawle's Janet, Jonathans, Early Harvest and Red Jones, being the prevailing sorts; (2) to judicious management, good cultivation, low heads and very moderate pruning; (3) to the thorough protection it receives from the wind-break; (4) to the excellence of the soil, it having never yet received a load of manure.

January 30th.—Within the twenty-four hours that have passed since the above was written, we have had eight hours' rain-fall, and twelve or more of snow. This morning there are fully six inches of snow on the ground, and aloft, a bright, warm sun that will melt it all within three days.

Manhattan, Kansas.

Farm Economy.

MANUFACTURE OF MAPLE SIRUP.

HAVING had considerable experience in the manufacture of this, which is among the most wholesome as well as agreeable sweets we are permitted to enjoy, I thought that perhaps I might be able to give some of the readers of the RURAL some instructions that would aid them in making a pure article from the sap of the Maple.

To begin then: I would say, that in order to secure a pure article, no foreign substance should be permitted to find its way into the sap, from the time it leaves the tree till it is ready for use, either in the form of sirup or sugar. I have observed that most writers on this subject have taken the position that a first-class article of this product cannot be made without the use of all the modern improvements, many of which are, in cost, beyond the means of a large number of our farmers. Now, although I am willing to admit that these things are all very fine and convenient to have, and would advise all who have the means to afford it, to invest in some improved evaporator and other things of a like kind, still, I maintain that with the necessary care, just as fine an article can be produced with the common sheet iron boiler as with the best of those appliances. Neither would I argue that for a man of capital the improved evaporator would not be the most economical; but a poor man sometimes must do as he can, not as he would, and what I wish to show is, how people of this impecunious class may have an article equal to the best, and with *absolute cleanliness*. I know that a first-class article can and has been produced, where the sap has been caught in common wooden buckets. Indeed, previous to the introduction of tin buckets, I made an article equal in quality to any I have ever seen, and I believe as good as ever was produced. Still I would not be understood to recommend the use of wooden buckets in preference to those of tin, as I think, all things considered, the latter are the most economical; but I only wish to show that the appliances used are matters of less importance, than that everything which can give any color should be kept from entering the sap; for while a considerable quantity of foreign substance will not perceptibly color a hundred pails of sap, still when the whole is boiled down to a compass of only a few gallons, the coloring matter is so concentrated as to give a considerable tinge to the sirup.

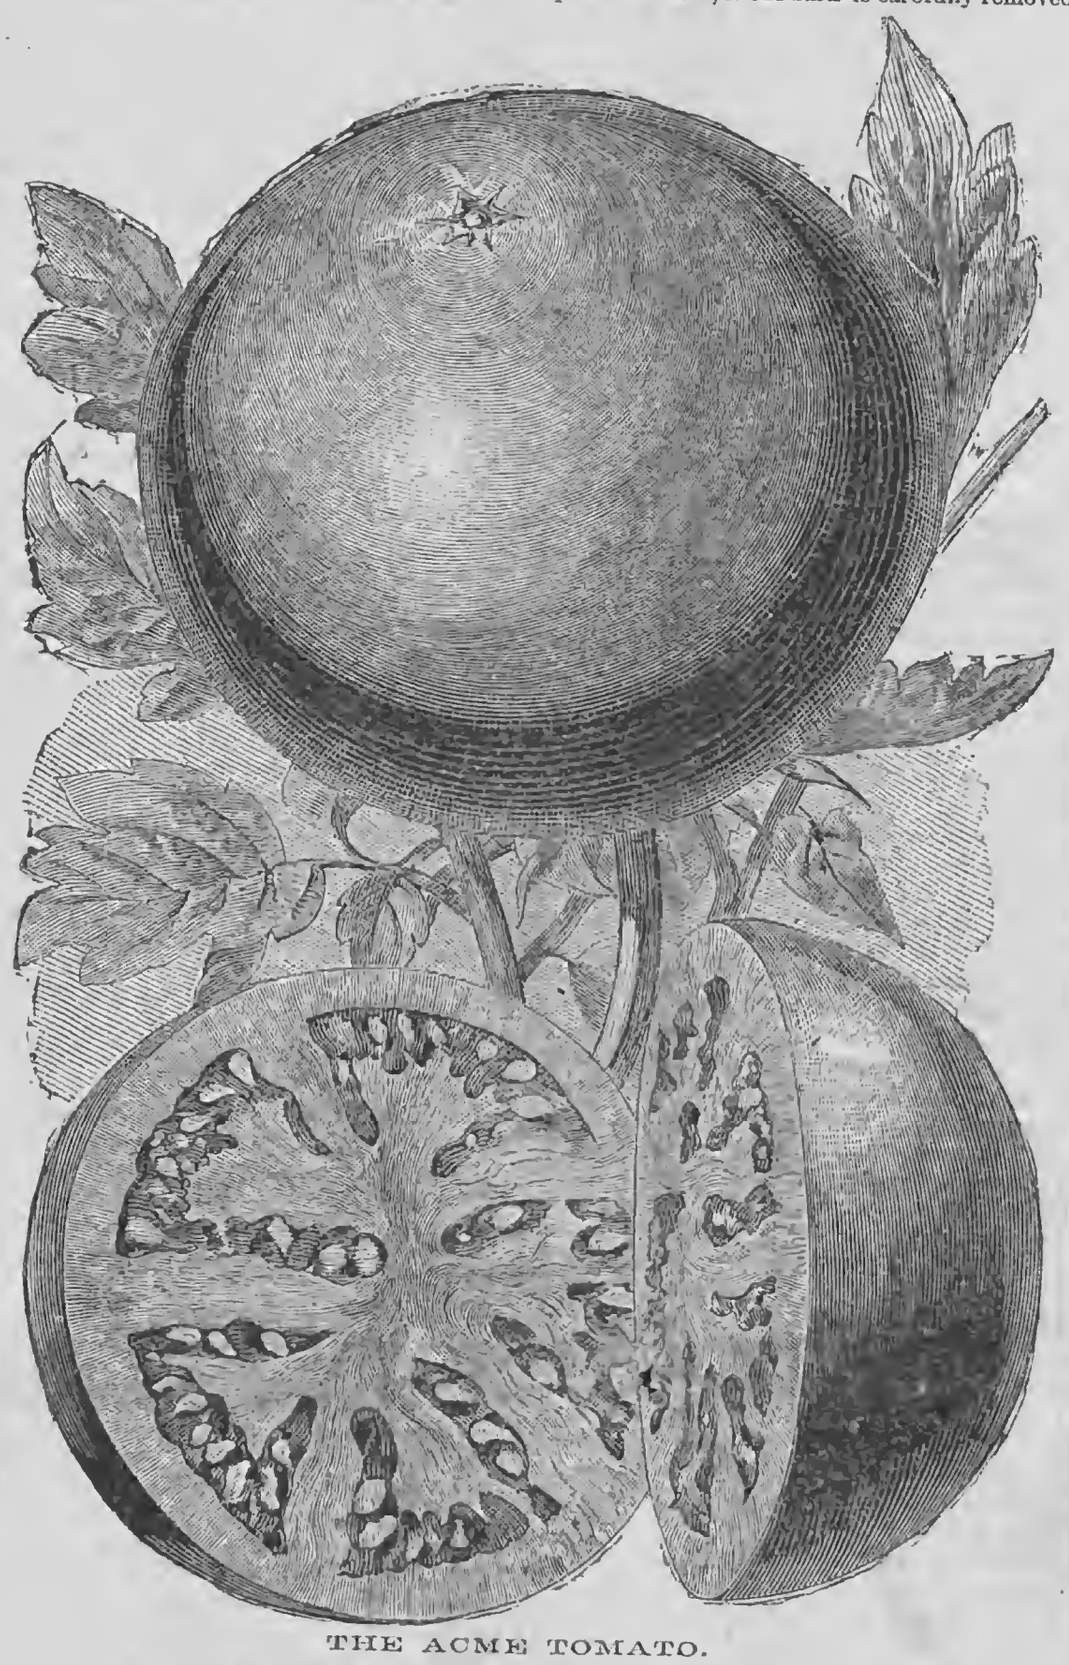
In regard to dishes, as I have already said, I believe the tin buckets to be, all things considered, the most economical, and those with covers would, of course, be an improvement, as in this way everything injurious could be kept out of the sap. As to spouts or spiles, there is a patent spile which I believe gives universal satisfaction wherever used; but if one wishes something less expensive, a very good spile can be made from scraps of sheet-iron, cut into pieces about four inches in length, an inch in width at one end and an inch and a half at the other, and this can be obtained at small cost at any hardware store. With these spiles, I should bore to a depth of about an inch and a half, using, in the first place, a $\frac{5}{8}$-inch bit and driving the spile well into, but not through, the bark, sharpening the wide end for this purpose. Then, when the trees have become dried up, and a new run comes on, they can be re-bored with a $\frac{3}{4}$-inch bit without removing the spile, and they will run nearly as well as freshly-tapped trees. And here is one advantage with these spiles that is not possessed by the patent article.

Of course, no one will, in these times, think of anything but hanging up the buckets; and with the tin buckets this can conveniently be done by simply driving a nail into the tree. For those who use the wooden buckets, a very convenient hook can be made in the form of a fish-hook without the barbs, to be driven in the tree with the hook turned down. The top of the bucket can then be hooked in between the hook and the tree. In using the wooden buckets I always, at the end of the run, turn them bottom upwards, and hang them by the chine to the hook, and when a new run begins, they are dry and sweet, which is not often the case when they are left partly filled with sap and rain-water.

The next thing to consider is: how shall we gather the sap? I use for this purpose a tub made smallest at the top and holding about thirty pailfuls, with a head in each end, and a semi-circular door sawed out at the top. Select for the boiling place, if possible, a sidehill or knoll where the boiling arch can be built at the lowest point; the store tub is to be set above this, so as to discharge the sap by leaders into the pans; and still above this drive, with the gathering tub, building up a bridge, if necessary, to get the sled on which the gathering tub is fastened, high enough to draw the sap from it into the store tub, thus saving all handling of the sap after it is gathered into the drawing tub, till taken from the pans as sirup. Arrange a cloth strainer over the store tub, through which to pass the sap, thus removing all leaves, etc., which may be in it.

One word more in reference to the construction of the arch, and I will close for this time, though perhaps I may hereafter say something further in reference to converting the sirup into sugar. It is important, in order to keep out from the pans all ashes, etc., that the arch should be as nearly tight as possible. Procure a casting for the back end of the arch, with holes for stove-pipe at each end, and let it be of the length you wish your arch in width. By this means you can best secure the necessary draft, the amount of pipe required depending in a great measure on location of the boiling place. Then build your arch of stones, using for mortar a compost made of equal parts of clean horse-manure and common loam, which is better for this purpose than lime mortar, or anything else I ever used.

S. J. B.



THE ACME TOMATO.

Horticultural.

A NOVELTY.

Among novelties in Tomatoes, we know of none more promising than the ACME, of which we present the accompanying excellent portrait. Mr. B. K. BLISS of this city, who will offer it in his spring catalogue, states that it has been carefully tested the past season in many localities, and that "all agree that it is not only one of the earliest, but the handsomest variety ever introduced." The tomato is of medium size, round, slightly depressed at the ends, very smooth. The color is a dark-red, with a purplish tinge. It ripens all over at the same time, and bears continuously until frost. It is said to be delicious in flavor, to have no green core, and but few seeds.

We hope to test the Acme for ourselves next summer, and to be able to confirm the above high claims.

SLITTING THE BARK OF HIDE-BOUND TREES.

I NOTICE in the issue of January 19th, an article on "Slitting the bark of Hide-bound Trees" and the opinions of several eminent horticulturists on the practice. As I have experimented considerably in this line, I give the results.

Whenever it is done during the fall or winter, it has seemed to injure the tree, leaving a wound slow to heal and liable to crack deeper, or the bark is apt to peel up from the edges of the slit; but when done toward the longest days in the year, or sometime in June, it has healed over at once without injury. In fact, a tree may be peeled all over, if the bark is carefully removed, without scraping the inner surface, or what, when peeled, is to be the outer surface or new bark of the tree, and this without doing any harm. As to its advantages—if the tree is healthy and thrifty as trees should always be, it is of no use—but if from any cause a tree stops growing and becomes "stunted"—remove the cause, and yet the tree will not start; but cut away some enfeebled limbs, and remove or slit the bark, and the tree starts at once. Two years since, we had a six-year-old block of nursery apple and pear trees somewhat "stunted," that came into our hands by purchase of the land. As we wished to plant an orchard, and these trees were not very salable, we set 2,000 of the apple trees and 1,000 of the pear trees in an orchard, believing that, as they were healthy, they could be made thrifty. They barely lived the first season but made no growth. Last spring, in April, we trimmed about half the orchard pretty severely, and slit the bark of some of them in *June*; those that were only trimmed grew well, but those whose bark was slit, out-grew the others and the bodies swelled out—and were much more stocky than those not slit. The bodies healed up where slit, and took on a much more glossy appearance, and were altogether more handsome trees. We also fancied when there was a tendency to blight, that the slitting was beneficial, at least there was no appearance of blight among those that were slit, and there were half a dozen cases among those not so treated. The trees that were neither trimmed nor slit, scarcely made any growth of top, but inclined to sprout up near the root, and along the bodies, rather than to make top growth.

We also had an orchard of some 200 trees, six years planted, on a farm bought three years since, that stood in a meadow and looked badly. We seriously considered the question of removing them and replanting, but decided to try renovation; we drew from the streets of Rochester such coal ashes as we could find, and put half a load around each tree, first trimming off close to the trunk the mass of sprouts growing around the roots, and cutting out all stunted and dying branches, leaving the head open, and the limbs not crossing each other. In June we slit the bark of the worst looking trees, and now passers-by often remark, "What a fine, thrifty, young orchard you have!" We have since plowed the ground and shall not seed again for four or five years; we shall use at least a load of coal ashes to each tree, as a mulch and to keep away insects. This orchard has lost by neglect at least three years in growth; but we think has fully regained its health and vigor. We always find it difficult to start a new growth on a tree that has stopped growing in the nursery, but prefer to cut back to the ground again, when without other treatment, it will grow well. J. B. J.

THE LAW AS TO THE SALE OF TREES.

YOUR correspondent "Ruralist," in his report of the late meeting of the Western New York Horticultural Society, was misled into saying that it was found that there must be fraudulent representation to make a nurseryman liable for the sale of spurious trees. One member *did* state from hearsay that such was the rule laid down in the case of Van Wyck vs. Allen, and that judgment was given for the plaintiff only because the defendants had represented that their cabbage seed was grown by a particular man while that supplied was not; but after the adjournment I was enabled to point out to the gentleman referred to, from an official copy of the charge of the judge, that in that case the Court expressly refused to charge that the representation referred to was material and instructed the jury that the vital point for them to determine was whether or not the seed sold was, in fact, "Early Flat Dutch Cabbage."

Damages are no less serious in their effect upon the sufferer because they are the result of negligence or mistake rather than of wilful fraud, and when one of the two men must suffer, the law naturally chooses to place the loss on him by whose mistake, negligence or fraud and at whose profit the damage occurs, rather than on one who has had no part or lot or profit in bringing about that result. It says: "If a man come to me and asks to buy a particular article, not readily distinguishable, and I give him one resembling it, I thereby warrant to him that the article supplied is the article asked for, and undertake to make good to him the damage, which naturally follows from its failure to be such article." Any other rule would be a cloak for swindling, because it would compel the sufferer to not only prove that he had suffered by his adversary's act; but it would force him to reach down into the secret chambers of the swindler's heart and prove that he intended to swindle. Happily the law is not so capricious as that.

In principle the law is all right and it is unfortunate that a fear of its execution does not deter many from committing frauds now prevalent, or drive out of business those who are incompetent to transact it rightly; but the difficulties incident to proving claims under this law are, owing to the nature of the articles affected by it, so serious that few will avail themselves of its provisions unless their damages are great or the circumstances under which they arise very aggravated. EUGENE GLEN.

Floricultural.

BULBS FOR THE FLOWER GARDEN.

W. C. L. DREW.

ALLIUMS.

THE Allium family of bulbs, although known for many years, are very seldom met with in the flower garden. They have been very much neglected, not only by amateurs but by scientific cultivators. This is probably due, in part, to the very savory name, Flowering Onions, by which they are commonly called. It is perhaps too suggestive of the vegetable garden to allow them a place among the flowers. They are, however, except in name, entirely unlike that tear-productive vegetable.

For several seasons I have grown and flowered the several differently colored varieties, with the greatest of pleasure and satisfaction. Indeed, I had no handsomer bed in the garden, than my bed of white, blue and yellow Alliums. Of the white variety, I had specimens over two and a half feet high, the umbel of flowers being eight inches across. Without reflecting on the beauty of other bulbs, I can safely say there are none better for border ornamentation, and that they should occupy places where many far less showy plants have found favor, merely because they have a higher-toned appellation. They have much to recommend them; the several varieties are all hardy, require no particular care to bloom very satisfactorily and produce yearly masses of beautiful and showy blooms; the flowers last for a long season, at least two to three weeks longer than Hyacinths.

There are three varieties in ordinary cultiva-

tion, Allium azuroum, a handsome bluo flowered variety growing one foot high; A. Moly album, a pure white variety attaining a hight of one and a half to two feet; A. Moly is a bright yellow flowered variety, growing one foot high. I find none of these catalogued by our American bulb dealers. We have also two varieties, natives of California, Allium acuminatum, with bright rosy flowers, and A. Wicksonium with pale, rose-tinted, lilac flowers: both of these are very handsome, and woll worthy of a placo in any collectiou.

ORNITHOGALUM.

Another bulb of merit, which has been sadly neglected, is the beautiful but delicato Ornithogalum, or Star of Bethlehem. I use this for borderiug beds of larger growing bulbs, with the best of satisfaction, preferring them to Snow-drops for this purpose. They grow six to eight inches high, producing their pretty flowers in clusters of six to a dozen oach.

There are two varieties in cultivation, but I only find ono in American catalogues, the Ornithogalum umbellatum. This variety is very hardy; the flowers are white, variegated with green linear veins. They remain in bloom for a number of weeks.

Ornithogalum aureum is a very beautiful variety, in this respect far surpassing O. umbellatum. It is not hardy, however, and in all its movements very slow, so that it can never become so common. To bloom, it usually requires two years' growth. It can only be flowered successfully in the house or conservatory; and only in a pure sandy loam, free from manuro, has it flowered well with me. Some who have tried it, not boing aware that the bulb usually lies dormant the first year after removal, throw away the contents of the pot, thus losing the bulb, and all chances of seeing the flowers slowly expand. The flower well repays the little attention required during the two years' waiting and watching.

THE FLOWER GARDEN.

W. FALCONER.

On high, dry positions—as on terraces around houses—Aconites and Snow-drops will soon appear if tho weather he mild, and should therefore be looked to, to reduce the mulching a little from over them, so that the stems may not emerge bleached and weakly. Most other herbaceous plants had better remain undisturbed for some time yet.

Vines.—Clematises may be unraveled, pruned a little if necessary, and tied up in place. Their stems are very brittle, and though they don't break right off, they often get sadly mutilated by twists and strains, consequently should be handled with care. Akebia quinata is a very pretty vine that grows quite thickly; a reduction of the minor branches invigorates and beautifies the remainder. The Dutchman's Pipe (Aristolochia Sipho) is a favorite pillar, trellis, and screeu covering, and usually a lot of the wood dies every year. These dead pieces should be removed, also the most weakly of the living. Honeysuckles and other vines should be strongly fixed to their supports. The old stems of Hops, Ground-Nut, Wild Balsam Apple, Nasturtiums, and other annual and herbaceous vines, look most unsightly during the winter months if not removed from their summer supports, therefore they should be cleaned away, and the wires or trellises refixed for next year's crop.

Ampelopsis tricuspidata is perhaps our most serviceable self-clinging wall covering; it grows freely, propagates readily, is extremely hardy, and produces a dense luxuriance of neat green leaves in summer, which assume a lovely crimson-tinted hue in fall. It is a great wanderer, however, working into every nook and cranny, and if permitted, will obscure window and wall with equal fondness. To have it appear appropriate, we must keep it in place, and recall the disobedient branches by removing them altogether, or tacking them elsewhere into position.

Pruning Shrubs.—Of course, we look upon the winter months as the time for pruning, and many amateurs—and, I am sorry to say, professional gardeners too—prune all shrubs on an equal footing. They get a pair of hedge-shears, and ruthlessly clip over isolated specimens of Deutzias, Mock-Oranges, Diervillas, Spiræas, Althæas, and other garden shrubs in piano-stool, semi-spherical, or any other "looks-nice" fashion, that may suit their fancy. This is barbarous desecration. Deutzias, Diervillas, Mock-Oranges, Lilacs, Japanese Quinces, double-flowering Almonds, Forsythias, Spirea Thunbergii, and such like shrubs should be pruned but very little now, and that only enough to thin out the weaklings and preserve a comely and limited form. A little disbudding in spring or early summer, very considerably lessens pruning, and so far as I have observed, I have experienced no noticeable check or evil in judiciously pruning Diervillas, Forsythias, and some others after they have done blooming and before they start vigorously into growth.

In pruning, I make it a point to cut out a portion of the most exhausted old wood every year, and thus maintain a body of young and vigorous branches. Spiræa paniculata we find bears much the largest panicles, when cut hard back—to a few eyes from the ground. Althæas, too, require severe pruning; but even in their case I must rigidly deprecate the use of the shears, as with it the good and bad branches are equally treated, and the result, a crop of basket-osiers-like wythes quite unbecoming to the flower garden. Use the knife instead. Many shrubs, as Chaste Shrub and Snow-drop Tree may have their branches winter-killed a little; hence, it is advisable to leave them unpruned for a month or six weeks yet, till danger of severe weather is past, and it can be fully ascertained how much is dead. Their shoots should then be cut back to good fresh wood and healthy eyes. Some shrubs—as Callicarpa purpurea and Hydrangeas, are often killed to the ground, and these likewise should be left uncut till the approach of spring, as the dead branches are, in a measure, a protection, and they serve to keep the mulching in place.

Winter Protection.—It is not in November or December that our shrubs and flowers want our protecting care; we merely apply it then as a matter of convenience, but now—February till April. Tender nursing cannot be commended, as we may be likely to kill with kindness. Providing a little mulching of leaves, litter, manure, sedge-grass, earth, or ashes, has been applied over the roots, a few Hemlock Spruce, or other evergreen twigs or branches placed right over the plants, greatly preserve them from injury. In the absence of evergreen branches, any twiggy branches will prove useful, as will also thinly made umbrella-shaped straw thatches. These branches and crinolines are more applicable to shrubs than herbaceous plants, as the latter, root and crown, may be mulched with impunity. In the case, however, of Statices, Armerias, and a few other of the finer kinds of herbaceous perennials that have persistent foliage, I place a few twiggy small branches right over the plants and then some sedge grass over that, and I find this method preferable to placing the grass immediately on the leaves. In mild weather it would be highly beneficial to remove the protections and replace them nightly or as danger approaches; but I scarcely think the results would pay for the trouble.

Cambridge Botanic Gardens.

NEBRASKA PLANTS.

I am frequently in receipt of inquiries concerning plants that are pretty and novel to Eastern people. Prof. Aughey describes fiftoen species of cactus growing within the State. Of these only two that are found in my neighborhood, are worthy of cultivation; to wit, Mammillaria macromeris and Opuntia vulgaris. The latter is generally frozen to the ground during the winter, but it springs up on the advent of milder weather, and by the last of June is in full bloom. It is about as tenacious of life as the old-fashioned "Live-for-ever." If any fail with this plant, it will be by over-watering. This is perhaps true of all cacti. Mammillaria macromeris is a great favorite here. It is somewhat of a globular form, corrugated and bristly. It is entirely hardy during our coldest winters. I don't know why it would not thrive without protection in Canada. In early June it is crowned with from one to four beautiful blossoms.

Yucca angustifolia is a candidate for public favor. To me, it possesses the greatest interest. When other vegetation is brown with frosts or clad in ermine, its long, dagger-like, ever-green leaves form a pleasing contrast. Scattered among ever-green trees it possesses a decidedly fine effect.

Schraukia uncinata is both pleasing to the eye and agreeable to the nose. Its blossom looks like a little gold-bespangled ball and is deliciously fragrant. It bears a compound leaf which is somewhat sensitive, like its renowned cousin, Mimosa pudica, and it is sometimes known as "Sensitive briar." It is generally found most abundant on broken ground, thus clothing in beauty what would otherwise be barren. I don't know how it would stand transportation, but I am sure that it would please wherever it can be found in perfection.

Euphorbia marginata and Verbena montana are at home here. The florist's catalogue sufficiently describes them.

Shepherdia argentea is a shrub bearing in profusion scarlet berries which remain without falling off for a long time. Those who have tried them say they are unsurpassed for jelly. I can testify to their excellence in pies. The shrub is somewhat thorny, and I propose to test its adaptation to hedging. Last year Prof. Aughey ordered this and some Y. angustifolia for the college campus in Lincoln.

Negundo aceroidos, as its name indicates, bears an intermediate position between the Ash and Maple. It makes a clean, pretty, shade tree and is a vigorous grower. It is extensively used here, in the West, on claims for timber culture. I have a few thousand trees just right for mailing, and I think a few quarts of seed left over. Orders for any of the above will be placed on file and filled in their season. I would like, in exchange, hardy climbers, bulbs, roses, Concord grapes, currant cuttings, goose-berry,—in fact any small fruits, chufas, artichokes, pearl millet, Butman squash seed, Prescott molon, Compton's Early Field Corn, Longfellow's Field Corn, or almost any choico seed or plant. Order what you want and give me your list from which to select.

Miscellaneous.

JOTTINGS FROM MY NOTE BOOK.

CLINTON.

AGRICULTURAL HORSE TROTS.

The time for the annual meetings of our State, County and Town Agricultural Societies is now probably mainly over, and the officers generally chosen for the ensuing year. Making out premium lists will be next in order. Let us hope that in performing this duty, the officers will not lose sight of the professed object of such Associations, which usually is to encourage improvements in agriculture and horticulture and also in manufactures and the domestic arts. To convert these annual exhibitions into mere "Horse trots," as too frequently is the case, is a sad perversion of their professed objects. The plea is to improve our breed of horses; a very laudable purpose, it is true, if properly directed. But will mere competitive trials of speed, for short distances, do this?

If the ability to trot a mile in the shortest possible time, were the only requisite for that valuable animal, the horse, then indeed there might be some plausibility in the plea. But we all know that this ability is not at all a desideratum with the agricultural community proper. What is of far more value to us, is a breed of horses for all work, combining strength with agility, adaptable either to the plow or to the road, as occasion shall require. A good walker and roadster, easily kept, and with powers of endurance fitting him for any emergency that will be likely to arise—that is the breed of horses the farmer wants. By directing the attention mainly to the rearing of a breed capable only of going at the greatest possible speed for a single mile, we are led to overlook the more valuable quality of being able, in case of emergency, to go at a rapid rate for hours together, without injurious fatigue or exhaustion. This service the animals usually exhibited at these horse-trot fairs, are generally entirely unfitted for. They are best adapted to displays of short spurts of speed, after which they require to be carefully rubbed down, sponged and blanketed, and to enjoy a season of rest before repeating the effort.

There is much reason to apprehend that the tendency of these annual horse trots, in connection with our farmers' fairs, is to destroy the qualities of the horse, most valuable for the agricultural community. The New York State Agricultural Society has wisely excluded them entirely from its exhibitions. It would be well if our county and town societies would follow this example. The excuse for not doing so, is that such exhibitions attract crowds who otherwise would not come, and these add largely to the receipts for admission. In answer it may well be replied that they also attract a crowd with which it is not desirable that our sons, wives and daughters should be compelled to come in contact, including not only the vulgar, the profane and the intemperate, who feel no interest in any other part of the exhibition, but also blacklegs, gamblers and pickpockets, who seek such opportunities to ply their vocations. If the main object of such organizations is to *gather money*, then, like any other speculations, they will be likely to be continued so long as they can be made to pay. But we had supposed their object to be a more creditable one; and we still believe that in most cases it is. But in the other cases, we are satisfied that the course pursued prevents the attendance of many respectable persons who would otherwise be glad to assist in sustaining them. If such societies continue to be perverted by making such exhibitions the leading object, then the State cannot too soon withhold its annual appropriations from all such State or County Societies as continue the practice.

THE USE OF COAL ASHES.

Coal ashes are pronounced by many to be valueless for agricultural or other useful purposes. Consequently they are frequently allowed to accumulate around the premises till they become a nuisance. In cities it is the practice to have means provided for their frequent removal at the public expense. But in villages and country places the practice is usually different. Probably a large majority of our farmers get their main supply of fuel from their own wood lands, but the use of coal is constantly increasing in all parts of our country. Where the ashes of coal and wood are mingled together, there can be no doubt of their manurial value, and the greater the proportion of wood ashes composing the mass, the greater the value, of course. But coal ashes alone are of some value, even to any one who has but a mere garden spot to cultivate. On heavy soils they may be used to advantage, in large quantities. They tend to meliorate the soil and render it more porous. They may also be used beneficially in forming little mounds about the trunks of small trees, to protect them from the depredations of mice in winter, and are better for that purpose than earth. When spring opens they can be spread around on the surface of the soil and worked into it. Covering the ground under currant bushes with coal ashes is useful in preventing the larvæ of the currant moth from burrowing in the soil for his winter hybernation, or emerging from it readily the ensuing season. They may also be used to advantage around other bushes or shrubs, and are useful as a portion of the material for constructing walks. They may be also used to advantage as a deodorizer in privies and water-closets, absorbing the offensive odors otherwise likely to emanate from them, and the mingled mass will thus become a valuable and inoffensive fertilizer.

NOTES AND COMMENTS.

W. H. WHITE.

SHADE TREES.

The error of Mr. Curtis's neighbor, Vanguysings, mentioned in a late Rural, is no uncommon one. We rural dwellers, at least many of us, think, and truly too, that shade, as well as ornament, is a fine thing during the summer and hot season; and so we plant trees, or build our houses under their shade, oftentimes without thinking of subsequent results. Shade and dripping of water from trees cause premature decay of even our most durable stone: how much greater is the destruction of wood! It is much better to plant large-growing trees a little more distant from our dwellings; plant shrubs nearer, and we get more ornament and less after regret. Sunshine is one of our greatest promoters of health, therefore let us not exclude it too much from the houses we live in.

TREATMENT OF POOR LAND.

"We have a few acres of land that for several years, has been bungled over and half worked, until it has become so poor that we can think of only one crop to apply the coming season, namely, buckwheat." "We propose to seed thick with large clover, and clover alone." This, I understand Mr. Bertram, is in addition to the buckwheat; the ground being located at the summit of a steep hill, it being impracticable to enrich the soil with manure, the clover being designed for fertilizing purposes. Will the clover take and grow well with the buckwheat as shade? and will not the buckwheat tend strongly to still further reduce and exhaust the soil? Buckwheat, as a crop, tends to make the surface soil very light and ashy, and the shade tends strongly to subdue lower growing plants, and for this purpose we often sow buckwheat to subdue some of our soils. Would it not be better, Mr. B., if you cannot fertilize *economically* otherwise, to sow the clover seed without any other grain, sowing with the seed gypsum, at the rate of about one bushel per acre, or applying it to the surface after the seed is sown and harrowed in; and make another application after the clover has come up and made a small growth? If the case were mine, I should leave out the buckwhoat, whether I made any substitute or not.

SAND FARMING.

What is sand? Writers differ so much in their ideas of soils that it is puzzling, often, to define their meaning. Pure sand makes a poor soil, or no soil at all, on which to attempt to grow any kind of crop. Our common, sandy soils contain more or less clay, and this it is which gives them their capacity for being improved or made productive. The sand farming referred to by Mr. Looms is on sandy loam. Of this soil there are grades: the lightest is a quick, warm soil, and crops grown on such mature early, while at the same time they partake of the nature of the soil; this gives to melons and similar products their rich, delicate flavor. These light and heavy sandy loam soils are the best of all our arable soils in New England for any crop we produce. There are considerable tracts where, a few years since, a person could buy any quantity for $3 to $10 per acre, which, rightly handled, are very productive of all kinds of crops; but they need constant manuring, to which they are very sensitive, showing its effects, in the crops, quicker than heavier soils. Some of these lands will

now command a price from ten to fifty times as high as twenty years since.

PLANTING APPLE TREES.

Prof. BEAL gives us some good thoughts concerning orcharding, which I can indorse from observation. There is one thing more I would have desired him to notice: What influence has our present mode of planting upon the increase of the depredating enemies of orchards and their products? Does it not invite, and furnish a most tempting nidus for, the most destructive enemies to plants? Would it not be better to set the trees so far apart as to completely isolate them?

VAN'S VIEWS.

ONE of the most prominent things just now is our weather. It is English pure and unadulterated,—fog, mud, rain, and profanity. We have not had cold weather enough to freeze the swamps, and no one can get out any wood, logs, or other products of the forest with which we were in the habit of helping to make the two ends meet. As a consequence, many of the farmers on new clearings are having a very hard time to raise their taxes. It is, however, not without its benefits, for it enables some of our farmers who are fortunate enough to have a good manure pile, to get it on their fields ready for spring. And I notice that there is a great change gradually coming over our practice of applying manure. Formerly if manure was hauled in the winter, it was piled in heaps in the field and in the spring it was spread; thus making a second handling necessary. Now our best farmers prefer to spread it directly from the wagon (or sleigh) as it is hauled. I will not enter into a discussion of the merits of either method but merely give the facts of the case.

Another effect of the mild winter has been to set our farmers at work in their stumpy fields and, next season, we shall probably have double the amount of ground over which the mower and reaper can run that we had last. After a field has been chopped over six or eight years, a team will pull out most of the stumps, if you take a soft time for it. But six or eight years is a long time to wait for them, and much time is lost in plowing, cradling and mowing around them, but to pull sound stumps with any stump-puller we have at present, costs more than it comes to. Have any of your readers tried blowing them up with dynamite? We have thought of trying it, but the fear of getting blown up ourselves has held us back.

During the past fall, an unusually large breadth of rye was sown hereabouts. With our variable winters and wet soil, it is hardly worth while to grow winter wheat, but rye is a very sure crop and it is a hopeful sign to see its increase. Another hopeful sign is the number of clover hullers being bought in the State. One agent told me last fall that he had sold seventeen of the "Birdsells," that year. Seventeen Birdsells will hull a great deal of clover, and clover means more stock and less exclusive grain farming. But if we must stick to our grain farming, we can very profitably use clover. One man who took a farm in 1863 when it yielded, on an average, thirteen bushels per acre, has brought it up in 1877 to an average of thirty-four bushels per acre on ninety acres of wheat. He has always sown plaster and clover with wheat, even when the land was to be sown with wheat the next year.

Our horses are just now laid up with what is called "mud-fever," a swelling of the legs which makes them as useless as did the "epizootic." It is said to have passed off in five to ten days in other places where it has been prevalent.

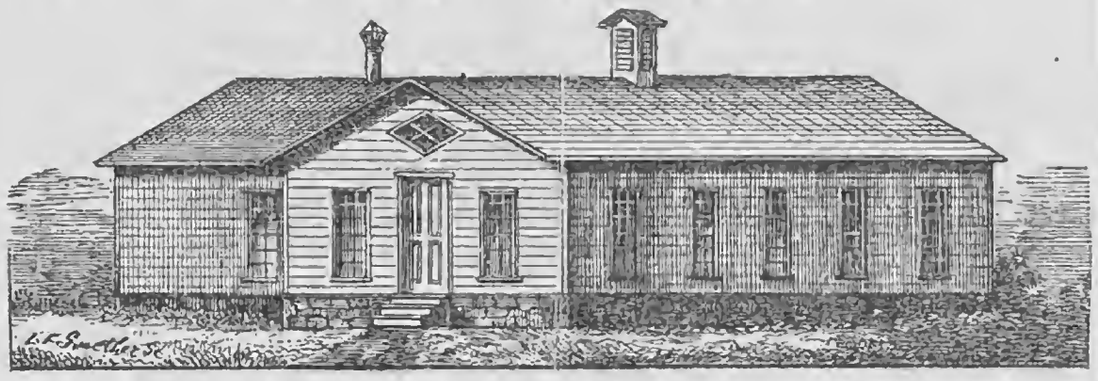
Fort Howard, Wis.

TRICKS OF TREE PEDDLERS.

IN reading an article in the RURAL of January 26th, by S. B. PECK, on "Those tree peddlers," I am reminded of the way myself and neighbors have fared at their hands, and thinking my experience may be of benefit to some fellow mortal, I will relate it.

An agent for a certain firm who represent themselves as nurserymen (and are of the kind who have no nursery or a single tree growing, but are merely peddlers of trees and as I have been told, sell what purchasers want, and deliver what they can buy cheapest, regardless of kind) called at my house and insisted on selling me some trees. After showing him those I already had, we agreed on price for a lot of dwarf pears, he agreeing they should be as large as a certain tree we specified. Soon another tree man came. I showed him a list of the trees I had ordered, told him the price, and that they were to be as large as the tree we made the bargain by, which measured 4½ feet. He told me that tree man No. 1, was not responsible, and had so swindled his customers that he did not pretend to go into the districts where he had sold trees five years ago; that I would not get the kinds I agreed for, nor as large as I expected. There was also a Champion grape in the list. I asked No. 2 what the Champion grape was. His reply was, "It is good for nothing; you would not eat one after a Hartford Prolific ripens, and you know you would not eat them after you can get others." I told him this was a poor recommendation for a grape he had sold at the rate of two dollars for a two-year old vine, but a month or two before.

Beginning to feel uneasy about my tree order, I began to inquire further about my peddler and found that he had sold one of my neighbors a bill of over thirty dollars' worth of trees about



MODEL PIGGERY—ELEVATION.

four years ago, the larger part of which died and the balance are diseased and worthless. Another neighbor bought seven dollars' worth at the same time, not one of which is living to-day. Feeling sure that I was "sold" I thought that I would write to the man and make him an offer to release me, telling him his agent had agreed that trees should be as large as one that measured 4½ feet. In reply, I got the most abusive letter ever put on paper. He told me that instead of being 4½ feet, they were to be three feet, that he should furnish trees that size and expect me to take them and pay for them, that I was a fool, and if I did not know any more than to let some irresponsible person who could not get any trade without slandering him, influence me, I ought to be put under a guardian. I am willing to admit I was a fool, but am a wiser man to-day.

I concluded the best way to "get even" with him was to sell trees myself and so much cheaper than he did that he cannot sell another bill of trees in our town. I ordered 150 Pears, 125 Roses, 25 Grapes, 500 Asparagus, besides some Peaches, Quinces and shrubbery direct from a reliable nursery at wholesale prices, and sold them among my neighbors, supplying them with reliable trees at about half the price they had been paying for trees hawked about the country by these peddlers: moreover, I have a margin left to pay me for time and trouble. If some good man in every town or district, would call round among his neighbors and take their orders for whatever they needed in the nursery line, and order the trees direct from some responsible nursery, he would do his community a great favor by furnishing them trees at one-half the money they have paid for what they know nothing of, moreover he would find the business quite brisk, for low prices and reliable trees would induce those to buy who were too sharp to buy of peddlers.

Jamestown, R. I. J. J. W.

CATALOGUES, &c., RECEIVED.

THE winter meeting of the State Pomological Society (C. W. GARFIELD, Sec'y.) will be convened at Allegan, Mich., the 13th, 14th and 15th insts. A feast of good things is announced in the way of papers and discussions. Addresses will be delivered by our correspondents, Prof. W. J. BEAL, Pres. T. T. LYON, Prof. A. J. COOK, S. B. PECK, and many others. We hope the meeting will meet with the success this wide-awake Society so richly deserves.

JAMES J. H. GREGORY, Marblehead, Mass. This well-known establishment offers its catalogue free to all. It contains 52 pages, 10x8 inches in size, many illustrations, both of vegetables and flowers, and all needed instructions to the amateur.

Mr. GREGORY carries on one hundred acres in annual tillage, on which he raises about one hundred and fifty varieties of the vegetable seed contained in this Catalogue. He guarantees that the seed shall be what it purports to be, in so far as to refill the order anew, *gratis*, in other seed, should the first prove at all defective.

THE proprietors of the RURAL offer the most ingenious, taking little gem ever before offered, to any subscriber who will send them two new yearly subscribers at the usual price. It is intended as a near approach to a valuable unconditional present See page 107.

AUGUST ROLKER & SONS, 44 Dey Street, New York, will send their catalogue of flower, field and garden seeds free to all applicants. Messrs. ROLKER & SONS are sole agents for several horticultural firms of France and Germany.

JOHN SAUL, the distinguished nurseryman and florist of Washington, D. C., offers to send his new catalogue which contains a number of plants offered for the first time in this country, with a colored plate, free to all his customers. To others he makes the nominal charge of ten cents. A plain copy free to all.

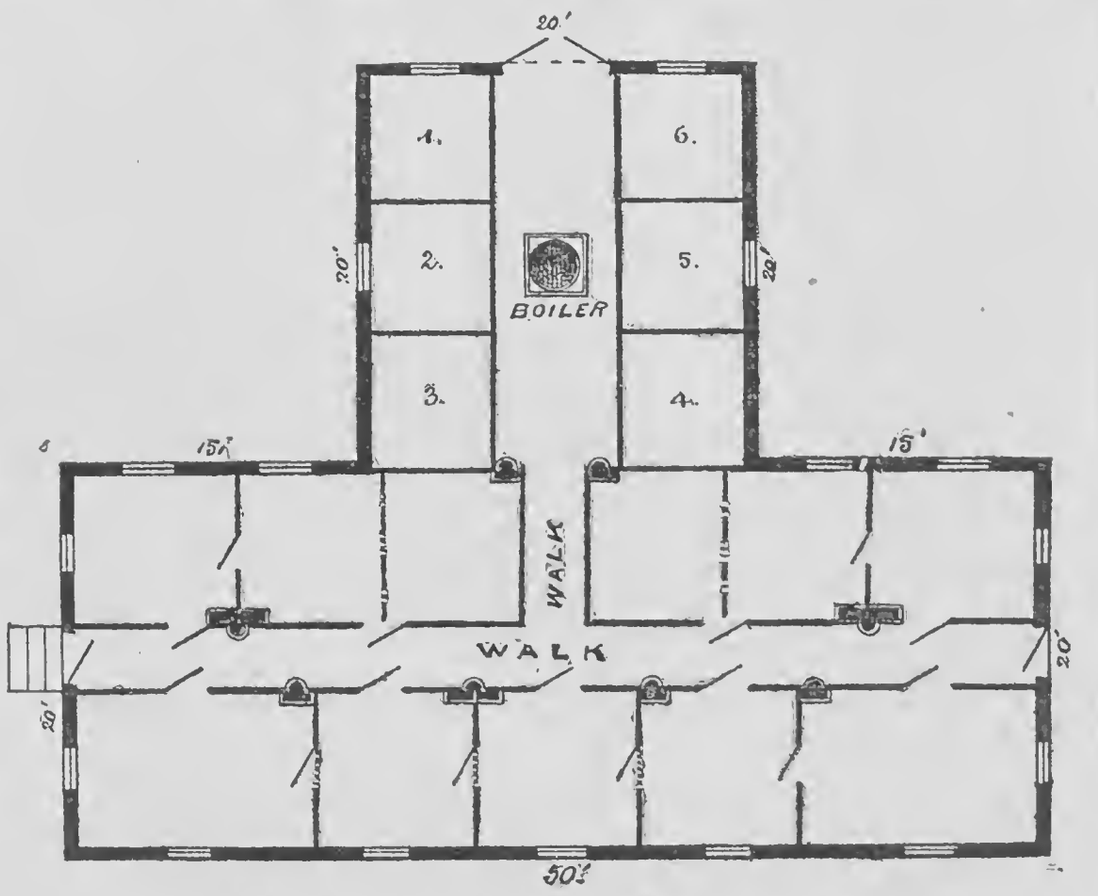
At the annual meeting of the Chautauqua County Agricultural Society held at the Secretary's office in Jamestown, on January 28th, 1878, the following officers were elected for the ensuing year:—President, John T. Wilson; 1st. Vice-President, J. H. Russell; Secretary, L. W. Wiltsie; Treasurer, Geo. S. Gifford. Directors:—M. Prendergast; Wellington Woodward. It was decided to hold the next Fair of the Society at Jamestown, N. Y., Sept. 10, 11, 12, and 13, 1878. Yours truly,

L. W, WILTSIE, Sec'y.

Rural Architecture.

A MODEL PIGGERY.

THE recent inquiry of S. LEHMAN, and the similar wants of hundreds of your readers prompt me to offer the following cheap, convenient, and eminently practical piggery as filling the bill very nearly, if not quite. It has the merits of being most compact and complete in itself. Being of this kind, it may be so located with reference to other buildings, that neither the odor, squeal nor grunt of the bristly beauties can interfere or offend. It has a water-tight, shallow cellar beneath it for making and saving manure in, which is part and parcel of the pen. The wood-work is raised out of and above the penetrating moisture and destroying influences of contact with the excrements, and is thus preserved as much as possible from decay. The floor and sides of each pen, firmly cemented for some three feet upwards, present an indestructable surface to the gnawing, chawing, tearing propensities inherent in swine generally. It makes the pens warm in winter and cool in summer.



MODEL PIGGERY—GROUND PLAN.

The pens communicate with each other and with the walk, affording conveniencies for ingress and egress of swine, &c. Each pen has a window, and the four corner ones have two each. These corner pens would afford good breeding places and could be made a little larger than the others.

1, 2, 3, 4, 5, 6, storage bins. Boiler in the extension. Walk, through center from which each pen can be supervised. Feed spouts communicate from walk to the feed troughs. Divided into nine apartments. If division is made across large pens where the dotted lines are, there will be eleven apartments all easily reached and controlled.

The building should be fifty feet long by twenty wide. Extension 26 by 20, both six feet posted; roof flat pitch; ventilator in center of roof; walk the whole length, 4 feet wide. The foundation may be sunk two to three feet in the ground, walled up and thoroughly cemented, the whole forming a tight, shallow cellar, the walls coming two feet above the surface of the ground. In this cellar there can be no leakage of manure either solid or liquid, and if kept well supplied with litter, as it should by all means be, there will be large amounts of the richest compost formed annually. The absorbent litter can be supplied by the windows, which should be so arranged as to slide horizontally out of the way and come low down. These slide windows can be left partially open in warm weather for ventilation. The manure can be readily pitched from each pen into carts or sleds through these same windows. In the extension the food is prepared by means of boilers &c. Convenient bins are prepared to hold, in bulk, roots, grains, meal, etc., etc. The whole structure is surmounted by a vane in the shape of the owner's ideal pig, and toward which—both model and vane—he should continually *aspire*.

Waldo Co., Me. J. W. LANG.

The Herdsman.

ALDERNEY CATTLE IN SHROPSHIRE, ENGLAND.

ONE of the oldest established herds of this beautiful and highly-prized milking breed, was founded in the year 1830 by its present owner, the Rev. JOHN HILL, at The Citadel, situated in the picturesque park of Viscount Hill, near Shrewsbury, in the county of Shropshire. Mr. HILL'S herd now consists of thirty head of which sixteen are in milk: they have been most carefully bred from FOWLER'S imported cattle, and strict attention has always been paid to their milking properties—some of them yielding twenty quarts and more per day. During the summer of 1876, trials were made and as much as 175 quarts per week were measured from a cow, which milk produced 322 ounces of butter, or nearly 1½ ounces per quart. The farm on which this herd is kept is light land and the grass of very moderate quality and no artificial food is given during the summer months. All the herd are of the fashionable dark, self-color, and are especially beautiful in their deer-like appearance, having elegant heads, small well-shaped horns and skins like satin. The bull now in service is of a rich, dark gray as nearly as I can describe it, with perfect points, and all his stock are of one uniform color, the whole herd, in fact, possessing that family likeness which is only attainable after years of patient perseverance and strict attention to breeding.

Mr. HILL has never used bulls except those directly imported from the Island, or bred from the best of his own cows. He has never exhibited but once, when he took the silver cup given at the North Shropshire show for the best Channel Island cow. They are thoroughly acclimatized and hardy and live on little food, and are eagerly sought after by all who know them; as they invariably improve when taken to richer and better pasture. To all those who may be interested in Alderney cattle, this herd is well worth inspection, and visitors will be well repaid for spending an hour or two in looking them over, and will get many a useful hint in farming matters in general, from a walk over the farm which is a pattern of neatness and perfection. AN ENGLISH CORRESPONDENT.

ACCORDING to the census of last year Switzerland has 593,000 cows, 10,000 bulls, 313,000 calves, 67,000 covered heifers and 53,000 bullocks.

Domestic Economy.

CONDUCTED BY EMILY MAPLE

SIFTINGS FROM THE KITCHEN FIRE.

ANNIE L. JACK.

I WENT over to neighbor BARTLETT'S, the other day, to the "Kitchen club" meeting, to hear Mrs. NELLIS read a paper on "Children's behavior at table." As this lady is the mother of three children, who are models of good behavior and neatness, she was considered the mentor for the mothers whose children are everything else *but* pinks of propriety at meal times. After the reading, each one gave her method of family government in this respect, and among the counsel were some very choice bits of wisdom, that are worth repeating.

Mrs. WILSON told us that her little ones were all supplied with rubber pinafores to wear over their dresses, and instructed early not to begin a meal without them. Mrs. RUTHERFORD said that when they had company, the children came to the table by turns, as many as there was room for. In this way they tried their best to behave well, and want of neatness was a signal for banishment. I asked the mothers if they had ever tried giving the children a picnic in summer. The looks of inquiry answered my question, and I explained that often in the spring or summer, and even during the fine autumn days, I packed up a lunch-basket, and sent the children into the orchard, within sight and call. They were provided with toy dishes, and amused themselves and each other by this pleasant method. "Please can we picnic?" is a common request at tea time, and it is quite a lesson in generosity when one child is deputed to share with the others some special dainty. Depend upon it, if tried, it would be thoroughly appreciated, and give the children lessons in housekeeping on a small scale, while helping to relieve the mother.

There was a diversity of opinions regarding the practical use of this suggestion, and then Mrs. PRICE recommended that for children under six, a half tray be bought, and as they were easily washed and kept bright, they were a great saving to a table-cloth. A napkin with a bright border, soon took a little one's attention, and they would learn to use it with a little teaching. It was also thought that the English fashion of a separate table for children, was good in many ways, as little children without judgment, will seek for condiments that are injurious, and often given injudiciously. Mrs. RUTHERFORD gave us a favorite lunch she prepared for her children to take to school. It was simply when baking to cover an apple with dough thinly drawn over it, putting in the slightest sprinkle of sugar. Bake and when done, cover with a cloth to keep the crust soft. Any healthy child will relish this plain lunch at noon. She also recommends giving a child a knife and fork early, guiding them in their use for awhile. They soon become self-helpful, and proud to be trusted. And so in talking over our little cares, they seemed to grow less by sympathy and discovery that our trials are mutual.

PUDDINGS.

White Pudding.

Two pounds of beef-suet; two pounds of leaf lard; ten pounds of wheat flour; one-half pound of salt; two tablespoonfuls, each, of thyme, summer savory and black pepper; rub thoroughly together all the ingredients and keep in a cool place. When wanted for use, tie the required amount in a cloth and boil until done; then remove to the oven and brown.

Yorkshire Pudding.

One pint of sweet milk; four eggs; one cupful of raisins or currants; one teaspoonful of soda and two of cream-of-tartar; a pinch of salt and flour enough to make a stiff batter; pour into a buttered pan and place in the oven under a roast of beef, allowing the drippings to fall upon it while baking. It requires about twenty minutes to bake and should be eaten as soon as dished.

Potato Pudding.

Boil two medium sized potatoes, mash smoothly and add two beaten eggs; one pint of sweet milk; two tablespoonfuls of sugar; flavor with vanilla and bake.

Egg Pudding.

One quart of sour milk; eight beaten eggs; two teaspoonfuls of soda; flour to make a stiff batter. Bake quickly and eat warm with cream and sugar, flavored with nutmeg.

MRS. MARY McC.

Cocoanut Cream Cake.

Four tablespoonfuls of butter worked to a cream; two cups of white sugar; one cup of sweet milk; the whites of four eggs, beaten to a froth; four teaspoonfuls of baking powder in four cups of sifted flour; bake in four or five square tins lined with greased white paper.

The Cream.

The whites of two eggs; five tablespoonfuls of sugar; one cup of sweet milk; one-half cup of cocoanut; two tablespoonfuls of corn-starch mixed with a little of the milk; mix all together in a pan and set it over a kettle of boiling water, stirring constantly until it thickens. When both the cake and cream are cool, put together; frost the top and sprinkle cocoanut over it.

MRS. S. C.

CIDER PUDDING.

BY request of a reader, we republish Mrs. SEWALL'S recipe for Cider Pudding, published in the RURAL of Sept. 29, 1877:

One pint of cider; one-half pint of molasses; one teaspoonful, each, of ground cloves and cinnamon; one teaspoonful of soda; one cup of chopped raisins; one-half cup of suet or butter; a pinch of salt, and flour enough to make a stiff batter. Boil two hours, and serve with hot or cold sauce, or both, according to taste. Milk substituted for cider will make an excellent pudding.

RECIPES WANTED.

WILL you be kind enough to give me a good recipe for making Clam Chowder, in your next number? You have so many good and valuable recipes, I think your Clam Chowder must be extra good. Also please give a recipe for making Soda Crackers. CONSTANT READER.

Clam Chowder.

IN reply to "Constant Reader," we give the following recipe, which we have used for years for either fish or clam chowder:

Cut into *thin* slices about one-half pound of fat, salt pork; place in the bottom of a kettle and try out until the pork begins to brown; then add four good-sized onions, chopped finely or sliced thinly, as best liked, and partially cook them in the fat; slice eight raw potatoes, and about six good-sized tomatoes (if canned, allow one pint); break into small bits one-half pound of crackers, and chop up forty clams; pour the onions and pork from the kettle and make layers of the ingredients—the bits of pork can be taken out or left in, according to taste—seasoning each layer with pepper, salt, ground cloves, a little chopped parsley and a small quantity of powdered thyme and summer savory; over the top place a few slices of lemon; cover with water, and cook from one to one and a half hours.

Will some of the RURAL sisters please give "Constant Reader" a recipe for Soda Crackers?

Everywhere.

FACTS, NOT FANCIES FROM MISSISSIPPI.

THE "Observations of a Commercial Traveler," in the RURAL of January 5, while presenting a fair picture of things as they appeared to him, skimming over the country on a railroad car, fall short of giving a correct idea of the condition of the people in north Mississippi at this time. It is indeed a deplorable one. The system of farming is simply execrable. The soil, so fertile in its virgin state, has deteriorated through unscientific and injudicious farming, until the "uplands" will now hardly make "nubbin-corn," and not enough cotton to the acre to pay for the picking. The yield is better in the "bottoms," but the same careless, thriftless methods in their regard are fast rendering them infertile. The amount of ignorance among white and black, in this part of the world, is absolutely appalling. In many houses the stock of books consists of a last year's almanac and a New Testament, and the poor white people are really opposed to sending their children to school, on the score of needing their services in the farm and household. So the free schools actually cease to operate for lack of scholars.

This country, twenty-five years ago, might have been the "garden spot of the United States," but it is now a paradise *only* for those farmers who have reserved capital. The large land-owners live in, or near towns, rent their land in small lots of thirty, forty, or fifty acres to poor white people and freedmen who, from one year to another, accumulate nothing, and seldom get able to "run" themselves, being fortunate indeed if able to pay their rent and store accounts at the end of the year. This "running" is undertaken by merchants who advance supplies at the rate of 100 per cent. for such things as meat, flour, meal, shoes and homespun; and 500 per cent. on "notions." These poor white people whose grade of intelligence is not greatly superior to that of the average freedman, have a penchant for such "notions" as candy, calico, lily-white and snuff, the colored man is death on cheese and crackers, "musk" and red-top boots, while both regard tobacco as one of the necessaries of life.

The credit and mortgage system prevails to a ruinous extent, and puts the poor white people as well as the negroes, absolutely at the mercy of the merchants. A very different state of things we find in the country from the description given by an enthusiastic land-owner on the look-out for tenants. Said he: "The land will bring "vodles" of corn; cotton opens like an oven of pop-corn; the rivers are full of fish, just stir the water with a stick and you can pull 'em out with your hand; the woods are overrun with deer, turkeys and squirrels!" Reality—wild turkeys as scarce as hens' teeth; no deer except in uninhabited river bottoms; you have to pay half a dollar for a great big, coarse catfish with a flavor of the mud in which it was spawned; cotton in the bottoms on freshly cleared land, only averages from a half to a third of a bale per acre; and nobody ever makes quite enough corn to supply his own wants, so that the merchants import Northern corn and advance it to the natives at $1.25 per bushel. I have known poor short-sighted white and black renters sell their home-raised corn in the fall and winter at 50c., 60c. and 75c. per bushel, and pay their merchants $5 per barrel for meal the following summer.

Another drawback to our perfect agricultural felicity is the malarial affection known as "chills," which keeps people shaking from June till November. To obviate this nuisance, quinine must form a regular ingredient of breakfast, taking it by the half spoonful on the point of your knife-blade. If you have got a regular "spell," you can only break it up by taking repeated heavy doses during the twelve hours preceding the expected paroxysm.

There is a tremendous stir just now among the colored people in regard to going to the "territory," as they call some "terra incognita" of the far West, where they think the long-expected "forty acres and a mule" will be forthcoming, evoked by a process as magical as the wondrous powers of Aladdin's Lamp. Considering the plight the poor creatures are in, the unprecedentedly short crop, leaving no margin for a fair start with this new year, it is no wonder that both white and black in considerable numbers, should resolve on "moving to Texas," as you say, Mr. Editor, or even follow in the wake of the frantic "darkey" who is off for the "territory."

PERLE PERDUE.

NOTES FROM CALIFORNIA.

THE Orange and Lemon are the most profitable orchard trees in Southern California, and that for many years they will remain so, there can be no possible doubt. The Orange is cultivated with success as far north as Sacramento, some parties claiming that finer oranges can be raised just south of Sacramento than at Los Angeles. Sixty trees are usually set to the acre. They come into bearing when from six to seven years old. Every year after this the trees become more productive. They frequently bear from 2,500 to 3,000 fruit when fifteen to eighteen years old.

NEW ORANGE.

To California has fallen the good luck to give the world the best sweet orange ever grown. It is known as Garey's Mediterranean Sweet, and is the result of several years' study and work by THOMAS A. GAREY.

The fruit is of a fine size and very symmetrical shape, which, together with its magnificent color, makes it the handsomest orange in cultivation. It begins to ripen in December and remains fresh and firm until August following. A finer flavored fruit could not be desired by the most fastidious epicure. The tree bears early, fruiting at from two to three years from the time it was budded.

We have had a storm of wind and rain that was something like our old-time days in winter. The wind whistled around furiously for several days, in some localities unroofing houses and prostrating fences without regard to the wishes of the owner. But the rain was grand. It will give many a desponding arm fresh courage and nerve; it makes the outlook for a good harvest look brighter, and with rain in the next two months—which cannot fail us—it will do much towards restoring California to her former prosperity. It was a general rain throughout the State.

W. C. L. D.

RURAL SPECIAL REPORTS.

SHERMAN, Chautauqua Co., N. Y., Feb. 1.

SHERMAN is a small town situated in the western part of the county of Chautauqua and in a rich farming and dairying region. The village is the center of trade and attraction for several miles around, and is the principal butter mart in the county. The crops, the past season, have been large and the farmer has enjoyed a bountiful harvest. The apple crop was the largest known in this section for many years. Green apples sell for 75@85c. per bushel, and dried apples 5c. per pound; oats, 40c. per bushel; pork, 5c. per pound; beef, 5@6c. per pound. We have had a very mild winter so far and with but little snow or cold weather. Yesterday morning, however, snow commenced falling fast and the prospect now is that we shall have snow enough to be even deeper than the mud of which we have had a considerable quantity during the winter.

M. L. D.

WHEELER, N. Y., Feb. 4.

WE have had an open winter up to the last days of January. A storm which had been brewing for some days, came January 31. It commenced snowing at 9 A. M. and continued throughout the day, and was snowing as hard as ever at 9 o'clock P. M. Friday morning, Feb. 1st found us shoveling a path to the barn (not to the wood-pile) through over two feet of snow.

The roads were broken out early in the day and the merry jingle of sleigh-bells now and then come to our hearing. We do not remember as much snow falling in so short a time, for a number of years. The lumbermen are making things lively now for this place. Farmers who disposed of their crops during the fall and early winter, can now sit by the fire, read their new almanac, and "laugh and grow fat.

Pork sold for 4@6c. in the fall. White wheat is now quoted at $1.20; red, do., $1.10 and spring wheat at 90c.; corn, 50c.; rye, 60c.; oats, 22@27c.; buckwheat, 40c.; barley, 45@50c. Potatoes were a good crop and mostly sold as fast as dug at from 20@26c. A few rotting quite badly.

S. S.

MEADVILLE, Pa., Feb. 6.

WE had about twenty inches of snow last week, which has helped business along greatly and has proved a great boon to our farmers. The dairy interest has prospered this last season. We have closed out all of our cheese and creamery butter at good prices and dairymen are correspondingly happy.

K.

The Apiarian.

OUR BEES.

MRS. A. E. STORY.

My readers are hereby informed that we keep bees. Last spring we bought three hives of the "Head of the household"—his entire stock—taking into partnership with us a youthful "Scion of the House," who has a taste for turning an honest penny whenever opportunity offers. We became half-owner of these bees confidently, with a full determination to let certain people we know, see what a woman can do when she tries.

We thought we know the ways of bees. "Get acquainted with your bees and let them get acquainted with you," say the books, and we began the acquaintance at once. It got to be rather a close acquaintance at times, but, as we thought it might result in mutual improvement, we kept it up. Towards the latter part of May we noticed that the bees in one hive hung underneath in a black mass. We shall have a swarm, and a large one, early in June, we thought. But our bees went out before the May did, and we hadn't even the *dis*satisfaction of seeing them go.

"A swarm of bees in May,
Is worth a load of hay."

quoted the wise ones; but without that old saying we were not likely to forget that bees do sometimes swarm in May.

"Well, in nine days we can prepare for the second swarm," was the reflection that, in a measure, consoled us. So we made new hives—no old, musty hives for *our* bees—and waited. Out they came at last, flew about long enough to alight twice over, then dropped down here and there and all over, and crept quietly back to their old quarters.

"Too strong a wind," said the knowing ones again. The next day they came out and repeated the performance, and, as this time there was no wind at all, the information that "something was wrong with the queen or something," more than satisfied us. It coincided with our own views exactly. "Three times and then out," said my partner, as we stood watching their egress from the hive, through a veil of mosquito netting. But the ways of bees are wonderful and past finding out. The queen was collecting her forces on a currant bush, after the most approved manner, when out comes a swarm from another hive, and the scene is changed. I don't say there was a battle in the air, but there was darkness and confusion there. A part of the new-comers took lodgings with the swarm on the currant bush, part sought a hanging place of their own, while goodly numbers of both swarms returned to the old hives. We got them hived, and then all might have been well but for the perversity of the bees that

would stick to the wrong nest. It was but a battle in a bee-hive, and it ended as all battles perforce must, when all of the weaker side had been killed. When the bees were moved to the stand at night we "took a peek," and found a good double handful in each hive.

That was but the beginning of the troubles and perplexities which our bees have caused us. One swarm went off out-of-hand. Another staid an hour or two, just long enough to set our mouths watering with a foretaste of white-clover honey—such a wealth of white clover as there was, too, in field and roadside!—when away they went. Another swarm, however, better disposed than the rest, settled down to work at once, and would, doubtless, have gone on improving the shining hours to the end of the chapter, had not the junior member of the firm been possessed by an uncontrollable desire to see how the work inside the hive was progressing. He tipped back the hive to take a look, the comb came down, and the bees with it. Next day they came out, but, stopping to rest on a hill of corn, they were prevailed upon to enter another hive. But that didn't mean submission on the part of the bees, as the next day showed us plainly.

"The bees are coming out!" That was the cry which summoned us from "Helen's Babies." Away went the bees over the fields, in spite of numberless pails of water thrown *at* them by the junior member, who forthwith withdrew from the firm in disgust. A man and a philosopher might have stood quietly by and seen his property thus take wing and vanish. Not so did we. We thought we had a right to know for what sort of habitation the one we had provided was thus unceremoniously forsaken. But house slippers are not just the thing to wade through the long grass with. They would come off at the heel, and I had to stoop down to pull them on, and so——well, the long and short of it is, the bees got away, and I returned to the "Babies" aforesaid, sadder and wiser.

After a month or so, one of the first two swarms having, without avail, made a desperate effort to gain a respectable livelihood, was driven out by worms, but, with our usual good fortune, we succeeded in capturing them. The next morning though, when we went to see how they were getting on, we found an empty hive. The bees had, to use a figure of speech,

"Folded their tents like the Arabs,
And as silently flown away."

"Bees never rob when there is honey to be got in the fields," say the books. Well, ours did. And yet not ours, but our neighbor's. Ours were the victims. The marauders began operations about the middle of September, and kept it up, off and on, for a month. Only one swarm—one of the old ones—gave up "beat," and that we took up at once. The others were fortified by narrowing the entrances, and whenever victory seemed doubtful, we turned the tide for the day by dashing on a barrel or less of water. But each succeeding morning only brought the besiegers back to renew the attack, till, taking a hint from a friend, we got ahead of them in the morning, closed up the entrances to the hives, and sprinkled the would-be robbers, as they came, with sulphur. They left forthwith, but came back at the end of a fortnight, when another sprinkling of sulphur brought an enduring peace.

We still own those bees, and next summer they are to go out of their present box hives into others of movable-frame construction, after which we shall hope for less trouble and more honey.

The Poultry Yard.

CARE OF POULTRY.

HENRY HALES.

WINTER WORK.

THE time will soon be at hand when the raising of young chickens will claim the attention of the good farm-wife. At such times the farmer himself is occupied tilling the ground and planting his crops, and to his wife and children are we indebted for the new-laid egg or the tender broiler, and for their sakes I will say a few words to the farmer himself. During the stormy months of February and March, many days are not fit for outside employment; at such times get your coops mended and white-washed, ready for use when wanted. If you have not enough on hand, make a few more. It is trying in spring to have hens hatch out their broods with nothing to put them in. Some make shift with an old barrel laid down, and many a good clutch has had nothing better. But a barrel is a miserable thing; the chicks settle down too much to the bottom part and many a one gets crushed, which in a properly made coop, with the flat ground for a floor, might be saved. I do not believe in board floors for chicken coops; they always have a very nasty smell that is unhealthy for the brood.

Make the coops square, the top sloping to the back with lath slats in front, one loose so as to slide out, for letting the hen in and out. Always, however, have a piece of wood for each coop, to be laid down inside in wet or cold weather, for the hens and chicks to get on. Often in summer during heavy showers, the water gets under the coops and drowns the little occupants. Have a piece of board about a foot square to each coop for feeding the chicks on, and if you are living in a part where minks or weasels are around, have a lath front, with the laths so close that the vermin cannot get through; when in use, put this at the front of each coop at night and prop it up with the feeding-board, to keep it from falling down. Such a slat front is better than board, as it gives air and ventilation, yet keeps the little chicks from getting out in the wet grass too early in the morning. During the day, it can be laid on the coop out of way, and using the board for feeding keeps the food clean

A lot of old fruit or tomato cans cut down, make good water vessels for chicks. Prepare one or two for each coop; by having these all ready, the poultry-keepers' troubles are much lessened at a season when many things are pressing to be done.

If you raise many chicks, have light slat feeding coops; slats all around a plot about three feet square, with the slats wide enough apart to admit chicks, but not hens. A few of these placed about the yard among the coops, allow the chicks to get in and out without being disturbed by big fowls, so that when they are left longer than usual unattended, they do not suffer for food. These conveniences can be made and stowed away till wanted. A little time can be profitably spent preparing such things now, and when required, if found all in good order, it makes work go pleasantly.

PIGEON SHOW AT THE NEW YORK AQUARIUM.

THE National Columbarian Society held a show in New York, at the Aquarium, in January last. The great variety of fine birds were much admired by the many visitors to this popular place of amusement. All the customary marine wonders were on exhibition, as usual. Few people can associate the idea of a simple pigeon with the great variety of pleasing forms and colors, to say nothing of the different sizes, brought together in this collection. There were little, tiny Tumblers and Owls; fine Carriers and Pouters of great size and beauty; Fantails of several colors; Barbs, Jacobins, Nuns, Priests, Trumpeters, Magpies, Ice Pigeons, Archangels, Romans of immense size, and many others. To attempt any particular description of all these varieties would be too long a task. The contemplation of such a variety of birds, all bred from one common parent stock, suggests what care and skill can do in breeding variety, in domesticated animals. Some people are inclined to wonder at the prices asked for a single pair of birds of some of the rarer varieties, amounting, in some instances, to several hundred dollars for one pair; but it is the difficulty of getting them up to this point of perfection that makes them so valuable. The price itself shows the rarity of such specimens. H. H.

POULTRY SHOWS.

THE New Jersey State Poultry Society held its first meeting at Elizabeth, Jan. 22–25. Quite a goodly number of birds of most of the leading varieties, were on exhibition. Asiatics were not as numerous as at some shows, except Partridge Cochins, of which there were some beautiful specimens. Leghorns, both White and Brown, were in full force. It is natural enough for these varieties to be well represented in New Jersey, for it is from that State that so many fresh eggs reach the New York market, especially Leghorn eggs. A great number of farmers in that State are now giving great attention to this branch of farming, and the result is that many up-town grocers in New York City can supply their customers with fresh-laid eggs, even at a reasonable price. Fresh Leghorn eggs are now a feature of the city market.

Many other breeds of fowls were conspicuous at the exhibition—White-faced Spanish, Polands, Games, Hamburgs, Plymouth Rocks, and many others. Such gatherings as these encourage the breeding of various kinds with purity and care, to which the farmer is indebted for the improvement of his stock. H. H.

CROSS-BRED FOWLS FOR PRACTICAL FARM USE.

AT the Eastern New York Poultry Show at Jamaica, two special premiums of $10 and $5 were offered by R. H. ALLEN & Co, Water St., New York, for the most useful cross-bred fowls or chicks. The conditions were, that the breeds of the sires and hens should be definitely stated, and that the exhibit should consist of at least two cocks or cockerels and two hens or pullets. Only two entries were made, one of which did not comply with the requirements, having been bred from mongrels on one side. Of the other entry there were four birds and, of course, no competition. This premium, I understand, will be repeated next year. This will give poulterers time to select their birds and to mate them for the purpose of breeding fowls to compete for this prize next season. It is to be hoped that this liberal offer will result in bringing out a good display of various crosses that will be useful and hardy birds and of good constitution, and prove a benefit to the community. H. H.

THE RURAL'S "CRICKET" CLOCK.

THE MOST BRILLIANT OFFER MADE BY ANY JOURNAL.

SOMETHING THAT EVERY FAMILY WANTS AND SHALL HAVE.

THE MODERN CRICKET ON THE HEARTH.

WE have been enabled, through the facilities afforded by our Experimental Farm (owned and operated exclusively for the benefit of RURAL readers) to make a FREE GIFT to our subscribers of a collection of rare and valuable flower seeds which have been enthusiastically received; and this gift on a still more liberal scale, will be repeated during the present year. Meantime, the RURAL itself has been enriched in all its departments, by the contributions from the best writers and life-like illustrations, demonstrating that our enterprise has not been at the expense of the paper.

This policy has been responded to by our patrons so liberally in subscriptions that we have decided, after a careful consideration, to make one more offer that shall

ECLIPSE EVERYTHING!

This offer is to subscribers, and anticipating the popularity of "The Cricket," we have made preparations for supplying this exquisite little Time-piece on the most extended scale. We regret that every one of our readers cannot see the "RURAL Cricket," as it is quite impossible to give any description of the premium that will afford a clear idea of its beauty, value and attractiveness. In our issue of next week we shall give a faithful representation of it, and then all may form some idea of what we now offer.

The "Rural Cricket" is inclosed in a beautiful circular metallic case of elegant design, which is nickel-plated. The face of the clock is white and has a "second" dial as in watches. The works are securely inclosed so that no dust can penetrate and harm their movement. It is like a stem-winding watch, in that it requires

NO KEY TO WIND IT!

and the hands are regulated without being touched. It runs thirty hours, is a chronometer-balance lever, jeweled, and it is guaranteed to keep as accurate time as the best watch.

IT RUNS IN ANY POSITION,

on its face, on its back, standing up, lying down, on its side, in short, in any position.

IMPORTANT!

This is the first time this clock has been introduced to the Puplic, and only after long negotiation with the world-renowned manufacturers, could we have a clock produced that exactly met our wishes. It is therefore unique, and no matter how many clocks there are in a house, all will want this insinuating little gem.

The offer is so liberal that it will be no trouble for thousands to secure the most valuable premium ever offered to the public without any more effort than is required to tell its merits to a friend or so. The lowest price of the "Cricket" is $2.50. We engage to forward it

First, to any one sending us the names of

Two New Subscribers and $5.00.

(which is the lowest cash price for two yearly subscriptions to the R. N. Y. alone.)

Second to any one sending us **$3.50** and the name of *one new* subscriber.

Should any one be dissatisfied with the "Rural Cricket" after an examination, he may return it at our expense and we will promptly refund the money.

THE
RURAL NEW-YORKER.
PUBLISHED EVERY SATURDAY.

Address
RURAL PUBLISHING CO.,
78 Duane Street New York City.

SATURDAY, FEBRUARY 16, 1878.

We earnestly request that all letters containing money, or any communication intended for the BUSINESS DEPARTMENT *of the paper, be addressed to the Editor, the Publisher, or* THE RURAL NEW-YORKER, *and not to any individual. We cannot otherwise guarantee the prompt entry of names upon our books, or the acknowledgment of money.*

WE have said that we should try to do more for our subscribers for 1878 than we promised. We respectfully call their attention to our announcement on page 107 as the first proof thereof. It will be seen, we think, that the offer there presented is the most liberal which has hitherto been made to the subscribers of any journal. As an evidence of our entire good faith, we would say that if the article does not meet the expectation of the subscriber, he is privileged to return it at our expense and we will at once refund the money.

ASPECT OF EUROPEAN POLITICS.

IN view of the momentous contingencies dependent on the election of a new Pope, the distrust produced by the vigorous action and astute diplomacy of Russia, and the uncertain issues of the approaching Conference on the Eastern Question, European politics wear a decidedly menacing aspect. The loss of the temporal power has by no means deprived the Papacy of grave influence in political questions, for the possessor of paramount spiritual influence over a large proportion of the citizens of nearly every nation in Christendom, must always be an important factor, not only in European affairs, but in those of the world at large.

The presence of the Russian forces within thirty miles of Constantinople and that of the British fleet in the Bosphorus, places these two Powers in a state of distrustful watchfulness, while the sentiments of both nations are becoming mutually more bitter. The Liberal peace policy in England has brought upon its foremost advocates a storm of opprobrium and unpopularity which will probably cling to them for many a day; but, however willing the Government may now be to support the Turk, the time for doing so favorably, has been suffered to go by. It would take at least thirty days to land a British force at Gallipoli or Constantinople, whereas the Russians could easily make themselves masters of both places in two. The Czar is emphatically now master of the situation. He can readily bid defiance to England, and by seizing on favorable points, prevent the entrance of her fleet into the Black Sea. He can afford to be comparatively indifferent to the action of Austria; for, with the free command of the Black Sea, he can make the Crimea the basis of supplies for his forces. The consciousness of his strong position will probably keep other nations watchfully neutral, at least until the proposed Conference shall have an opportunity of making a satisfactory disposal of "the sick man's" inheritance.

NOTES.

Some of the Best.—The Alnwick Seedling is thought in England to be their best late Grape of recent introduction. And Lord Napier is classed as the largest and best of early Nectarines. Of new Peas, the Criterion, introduced by Messrs. VEITCH of London, is highly spoken of. Of Potatoes, Maguum Bonum, as a general cropping Potato, is placed in the front rank. Of American varieties, the Gardeners' Chronicle says a good many have appeared during the past year, but although handsome in appearance it is premature to speak of them as suited for cultivation in England. Trophy, Centennial, Superior and Manhattan are specially noted. The Tomato is every year becoming a greater favorite in England. "Early Gem," by which we suppose Little Gem is meant, is highly valued as a dessert fruit eaten raw. Vick's Improved is set down as a "decided acquisition"—while our well-tried and favorite Trophy is thought to be fine for "exhibition purposes." During every year we hear a great deal of new fruits and vegetables, that are far superior to all others of their kind, but a very few of which are again heard of after the first season of trial.

To Readers.—Our circulation has increased over that of last year beyond our expectations; or rather we might better say, the increase over last year has fully met our expectations. The fact is simply that at this time our actual paid-for circulation is twice as great as it was the first day of August of last year, and of course it is increasing every day. The offer which we make on page 107, is one which we did not feel we could afford to make at an earlier date, though we have had it in mind for a considerable time. It will be seen that it is an out-and-out present, worth at the least retail price $2.50, to any one of our present subscribers sending us two NEW subscribers for one year. By such means, as well as by others which will develop themselves as the year goes on, the RURAL will strive to work a place in the hearts of its readers wider and deeper than that it has ever filled before. As we have no mind to be carried beyond our depth, we reserve the right to discontinue this offer upon giving in these columns due notice.

The Favorite Horse for New York.—The horses which bring the highest price in New York are those large enough with fine style and step to go before a carriage. They are called "park horses" because they are adapted for this form of driving. They must be full sixteen hands high. Bay is preferred, but other colors are often in demand. These "park teams," as the name implies, are for driving in the park, where every afternoon they may be seen by the hundreds prancing along with lofty step and showy style. They are not wanted for speed but for display. Fast driving is prohibited in the park, but out on the "road" beyond the park the trotters have it all to themselves. In New York the horses of most of the fashionable turnouts have their tails cut squarely off. It is called the "English style." There are two forms, one to cut the hair just below the bone and the other to square it off a little above the hocks. Some of the most elegant teams are not bobbed after this fashion but wear their tails as long as they chance to grow. Doubtless the owners have more regard for their comfort in fly time or perhaps they, like us, do not fancy this awkward style.

Hereford Herd-Book Society.—We hear from England that the above Society has been formed for the carrying on of "Eyton's Herd-Book," the copyright of which they have purchased from Mr. THOS. DUCKHAM, the late proprietor. A council has been formed, and editing and other working committees, on the same basis as the Short-Horn Society of Great Britain and Ireland. We are told that the prospectus will soon be published, and that the tenth volume of the book will be published under the new superintendence as soon as possible. The Secretary is Mr. SAMUEL URWICK of Leinthall, near Ludlow, England. We are glad to see the interests of this excellent and rent-paying breed of cattle looked after; their popularity is increasing over the whole world, but more especially in this country, where their merits as meat producers and their capability of living on rough feed, and being able to stand cold and wet, are becoming more and more appreciated.

Where to Sell Good Butter.—In talking with a person who had been a grocer, we heard the following remark in answer to the question, "Why do you not make more difference in the price of butter taken in from the farmers?" "We cannot do it. It will not work. Nothing will offend a woman quicker than to tell her that her butter is not first-class. If we tell her the butter is poor, she will sell it somewhere else, and she will trade where she sells her produce. To keep her trade, I must buy her butter. So it is often customary to pay about the same price for all grades of butter offered in small lots. We make on the best lots and lose on the poorest. We come out about even, satisfy all parties, and get the custom of those who sell butter which is good or poor." The better way for those who make the best butter is to find some regular customers and supply them from week to week, throughout the year. In this way, the producer gets better prices and avoids the close shave of middle-men.

A Word to Parents.—If you wish to make your son like his business place him in responsible places. Trust him; consult him about the work he is to do. He will take more interest in his work and be much more likely to succeed when he starts for himself. Don't make slaves of your children. For want of proper training, many a young man has grown up without discipline. He has been able to run through in an incredibly short space of time all that his strong-minded father left him. Twenty years ago we knew such a man. To-day his son owns only a poor old span of horses and is living from hand to mouth—and a very poor living he gets at that. The fine estate slipped easily from the hands of the son who had no skill to manage it. So one generation makes money for the next to squander.

Financial.—If JONES, a dealer in dry goods and groceries in a country town, should offer to take in trade potatoes and turnips, at the same price per bushel, while the farmers could, in an adjoining town get two bushels of turnips for each bushel of their potatoes, how many potatoes would JONES be likely to get in payment for his goods? When you arrive at a satisfactory solution of this problem, suppose you construct from it a formula and see how it will apply to the financial topic of the day.

Look to Your Cellar.—Clear out all decaying vegetables for the bad air will find its way into the rooms above and poison your wife and children, who may pine away and die. Do not, in such cases, lay it to some mysterious Providence. When the air is dry outside and near freezing, or a few degrees below, open the windows and cool and purify the air. Keep the windows closed on damp and warm and on very cold days. Pick up the rubbish; sweep up the litter; whitewash the walls and ceiling.

Exchange Resumed.—We now give notice that our seed and plant exchange will be resumed to subscribers during the next three months. Our old subscribers understand it. To our new friends we will say: State plainly the names of the seeds or plants of which you have a large quantity above your own needs and then state the seeds or plants you desire in exchange therefor. Finally write your address in full.

Do Not Wash, and Shear Sheep Early.—Washing is injurious to the sheep and to the washer. If not washed the sheep may be sheared earlier. If sheared early the new growth of wool comes on more rapidly. A sheep with a heavy fleece is in poor condition to stand a cold rain. She will suffer less if sheared. Sheep will do better and shear more if sheared earlier than common among most farmers.

BREVITIES.

GOOD things generally come slow.

THE man who thinks most—enjoys the most on the average.

GIVE us less dress and style, and more time to study and experiment.

PARENTS should find time to attend to the inquiries of their children.

SAVOY-leaved is about the only spinach raised by N. Y. market gardners.

AGRICULTURE advances with the improved condition of the common schools.

THE question is whether there isn't a connecting link between sausages and hydrophobia.

A PERSON may have a perfect knowledge of a trade in all its details, and yet be a very narrow man.

FOR private gardens no celery is so good or so little trouble as the Giant. It may remain where grown all winter, and well grown seed is always solid.

THE most successful farmer is not the one who squeezes the most money out of everything. His children and his wife should receive some attention. It should not all be given to his horses, cattle, and sheep.

LATE London papers announce the death of Mr. ANDREW MURRAY, a distinguished and much loved horticulturist. In speaking to those who sought his advice, he was wont to conclude with: "Now I have told you—do not believe me; go and see for yourself how it is."

MR. LAWES states that for twenty-two years in succession, artificial fertilizers (nitrogen, phosphoric acid and potash) gave an average annual crop of hay of nearly three tons per acre. During that period, a second crop was cut each yielding 2½ tons more.

OUR country children need to be in school more days in the year, and fewer hours of each day. A part of each day should be applied to technical education. In many cases, the large towns would be better off with less showy schoolhouses and teachers who should be better paid.

IF TAILBY'S "Hybrid" Cucumber is to become popular, it is time it made some progress in that direction. We have never praised it as a market variety, but for family use, it proved last summer, as it did the preceding one, the most tender and the smallest-seeded variety we have ever cultivated.

A THOROUGHBRED or a grade is much more certain to make good use of his food than a common or scrub animal. Feed in warm places; feed regularly. Do not kick, and yell, and thrash your stock, if you care to have them thrive. Roots and bran have a good sanitary effect in winter. Their food value cannot be estimated by the amount of starch or albumen they contain.

THE RURAL clock is the neatest, prettiest, most substantial article of the kind ever before offered for sale. It will please all, and everybody should have it even though he has a dozen clocks in the house besides. It will keep time in any position and may be carried from place to place. It is dust-proof, needs no key—the hands are moved without touching them—is nickel-plated—a pretty ornament for any room and an excellent time-keeper. See page 107.

MR. MEEHAN, in his interesting European Notes, makes the following statement which brings one back with a shock to an understanding of the real improvement made in the Strawberry by English horticulturists: "Strange, very strange, it seemed to me from a country where we are not satisfied unless we have a new kind of strawberry every year or two, to hear Mr. NORMAN avow that the best kind he had yet was the Keen's Seedling, a variety which may soon advertise its "centennial show."

THE always varied and interesting Agricultural department of the Tribune, speaking of "Brands and Butter," says: In Brooklyn complaints have been made against at least four dealers, for selling unstamped oleomargarine. Their disinclination to comply with the statute is not only a little suspicious, but impolitic. If they make a substitute for butter, which is as good as butter itself, they should let their manufacture stand upon its own merits, and should, in fact, prefer to stamp it, in order that the public may accord the palm to the thing which merits it. This is the true way of promoting an honest sale. Instead of pursuing it, some of them at least run the risk of paying a penalty rather than use the brand.

BUSINESS NOTICES.

Hearing Restored.—Great invention by one who was deaf for 20 years. Send stamp for particulars. JNO. GARMORE, Lock-Box 905, Covington, Ky.

For Women.

(CONDUCTED BY MISS FAITH RIPLEY.

KERAMIKAL KRAZE.

Of all the diseases that ever were known
Since Noah's unfortunate days,
The strangest that yet has afflicted mankind
Is the present keramikal kraze—
Ke-ra-mi-kal—
Oh, yes; the keramikal kraze!

You may spell it ceramical craze, if you choose
To follow illiterate ways;
But modern Kultcha kommands that it should
Be spell-ed keramical kraze—
Ke-ra-mi-kal—
You know—the keramikal kraze.

Whoever is seized with this kurious komplaint,
Very soon all the symptoms betrays—
And, by gum, every pot, mug and jug in the house
With birds, bugs, and Japanese blaze!
Ke-ra-mi-kal!
For such is keramikal kraze.

By and by, when this kueer epidemic is o'er—
The ash-man will stand in amaze
To find all the barrels so full of "ould pots"—
The remains of keramikal kraze—
Ke-ra-mi-kal—
Then adieu to keramikal kraze!

[Boston Commercial Bulletin.

DECORATING POTTERY.

Great as is the temptation to descant awhile on the history of Ceramic Art, and on its power of affording glimpses of ancient times and peoples' the scope of this article is too limited to admit of

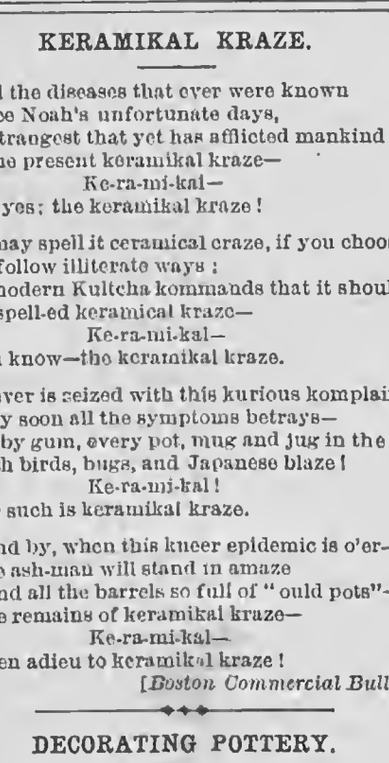

Fig. 1.

our doing justice to so imposing a theme; we shall therefore consider pottery solely from a decorative point of view, and without anything more in the line of preliminaries, we will proceed to give a few plain, practical hints on the subject of decorations.

First, as to materials used: they are: colors, platform, brushes, paint-saucers, tracing paper, impression paper, sand paper, spirits of turpentine and boiled oil. As the materials used in the decoration of pottery are few, they should be of the best quality, and carefully selected. Perhaps no one item will so much contribute to success or failure as the colors used, and a thorough knowledge of them is quite essential. Pottery or earthenware is porous and it is the different degrees of porosity which cause a difficulty. If it were all alike, there would be no trouble and the color once prepared, would always produce the same results. Unfortunately this is not the case and ware of a light bake will be found very porous. A hard bake is the other extreme, and between these is a wide difference. The first will absorb the color so rapidly that the pigment will be left on the surface as a powder, and will rub off.

Fig. 57.

Hard baked ware, being less porous, will not absorb the fluid so rapidly and the same preparation being applied will be allowed to dry more on the surface, and will form a glaze, which is not desirable. To obviate this, the color should be diluted with pure spirits of turpentine, which should be added drop by drop until a proper result be obtained. This can be done by testing it on the bottom of the vase to be decorated. Turpentine used for this purpose should be kept from the air,—a glass-stoppered bottle is the best vessel to keep it in; otherwise it will become gummy, and instead of obviating the difficulty for which it is intended, will only add to it. Neither should the colors be used from the bottle, as exposure to the air will cause them to become gummy, and unfit for use. Remove a small quantity to a paint saucer, and mix as required.

In mixing two or more colors to get a new tint, be sure and mix a sufficient quantity to cover the object intended, as it will be difficult to produce the same shade a second time. After using the colors, cleanse the paint-saucers and brushes

Fig. 3.

thoroughly with turpentine, else the paint when dry will be difficult to remove from the saucer, and will ruin the brushes for further use. We have shown how to graduate the colors for use on soft and hard ware. There is still another surface to be prepared for; when sand-paper and oil are used to improve the ware, the dust from the pottery and oil will fill the pores, and form a new surface. If the bottom of the vase be subjected to the same treatment, it can be used to test the colors upon. Sometimes it may be necessary to use a second coat of paint, to correct errors, or to change a pattern: in such cases, use more turpentine in the second coat, as the first coat will have changed the surface, and the same combination may produce a gloss. We have gone into detail in the use of these colors, as the material they are to be used upon is so entirely unlike anything else that special treatment is required to obtain full success.

A full set of pottery colors comprises white, black, red, blue, yellow, and gold. In the Grecian style of decoration, black is the principal color used; in Egyptian and other styles, all the colors can be used. For combinations of colors, in the different schools of decoration, see Owen Jones' "Grammar of Ornament," which may be found in the larger libraries. There is a more modern style of decoration, which consists in coloring the vase entirely with black, and ornamenting with flowers, birds, &c. In this, after coloring the vase black, the ordinary oil tube colors may be used.

If the decorator is not well skilled in drawing, or is making the first attempt to decorate, we would suggest that it be done by using only the first letter of the alphabet of the universal language of drawing—that is the dot. Make them longer or shorter, according to the place they occupy; a fine illustration of the capacity and power of this simple method may be seen on the new Doulton ware; they may be arranged horizontally, vertically or obliquely.

The extension of the dot in one given direction, or a point in motion, gives the straight line—the second letter of the universal alphabet.

Fig. 4.

Fig. 5.

Fig. 15.

In producing this horizontally around the vase, a simple mechanical device called a platform, will be found quite indispensable.

The platform will aid and encourage the beginner very much, for, by that alone, quite a pleasing effect may be produced by placing the vase upon the center of the disk, and then arranging the pencil or brush so that the point will touch that portion where it is desired to have a line or band; revolve the disk once slowly, and the work is done. For the next band or line, raise or lower the vertical bar, and so on. Horizontal bands and lines at different distances apart, with rows of dots, give a pleasing result.

With the straight line horizontal, vertical, and oblique, and in conjunction with the dot, many of the most pleasing and classic forms of Ceramic decoration are produced.

The meeting of oblique lines at the same angle gives the *zigzag*, another antique and universal decoration. The union of three straight lines gives the triangle—of four, the square—if they are of the same length and meet at right angles. With these taken as units, by varying the size and the thickness of the lines, hundreds of diverse patterns may be produced coming under what is technically known as "diaper work,"—a style of ornamentation peculiarly adapted to the embellishment of pottery. We would advise much practice in this before attempting the third and last letter of the alphabet.

When the curved line is added, the whole range of decorative art is open to the pupil; but our advice is, to keep to the simple curves as long as possible.

The quadrant, the semi-circle, the circle, will, in conjunction with the dot and straight line, furnish many pleasing forms; afterward the more subtle curves, as found in the wave scroll, the line of beauty, and the anthemeon may be attempted.

One common fault with beginners, we find, is the tendency to put on *too much ornament*, producing a loaded, crowded, disagreeable impression upon the mind.

Few, simple, and chaste, are the ornaments that have been universally used.

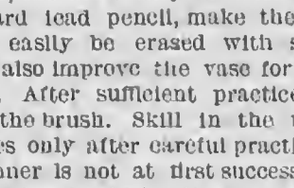
The law of the survival of the fittest only, has left us but a score or two of forms from the nations of antiquity; yet, few as they are, the combinations of which they are capable are many, and, with the variety produced by change of color, ample to meet all our wants in this department of art.

Fig. 2.

The better way to practice is to buy some vase—the cylinder is the simplest form, and, next to a flat surface, the most easy to work upon, and with a hard lead pencil, make the drawings. They can easily be erased with sand-paper, which will also improve the vase for permanent decoration. After sufficient practice with the pencil, try the brush. Skill in the use of the brush comes only after careful practice, so that, if the beginner is not at first successful, it is no reason why he should be discouraged. A good lesson on the cylinder will be to divide it into sections by drawing, with the aid of the platform before described, parallel lines at stated intervals around it; paint every other solid and alternate with figures selected from the studies given.

A knowledge of drawing—such as is taught in our public schools will be sufficient—will greatly assist the amateur; but it is not absolutely necessary, as with the aid of the platform, tracing and impression paper, very good results may be obtained; for instance, first, trace the design you wish transferred to a vase on to paper specially prepared for the purpose. A piece of impression paper must then be placed on the vase with the traced outline over it, then go over the lines carefully again, with some fine hard point—a very hard lead pencil will do. When the paper is removed, the design will be found transferred to the vase. To make the lines transferred permanent, it will be necessary to go over them with the paint, which can be done with a fine steel pen; although we would advise practice with the brush, until the pupil is proficient in drawing fine lines, as a pen is liable to scratch.

In the use of tracing and impression papers, a piece of thin white paper placed between, will cause the lines of the copy to show more prominently than they will over the impression paper—black is the best color to use, as it will answer in all cases except in drawing on black, when red can be used.



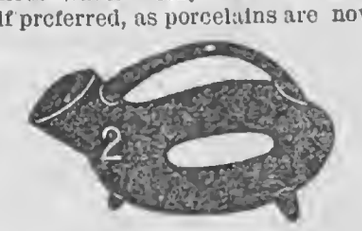
Pottery, as received from the hands of the potter, can be greatly improved by rubbing with sand-paper. Many persons prefer a darker shade than the natural color of the ware. This can be obtained by giving it a coat of boiled linseed oil. After rubbing down with sand-paper, a second coat will make it still darker.

The Albert ware is made expressly for ornament, and will not hold water without injury to the decoration. If the piece has a mouth wide enough to admit the hand, it can be made waterproof by first oiling it on the inside, then going over it with a coat of paint, and, finally, with a thick coat of varnish.

To those who are more particularly interested in transferring pictures from paper or from fabrics to wood or earthen ware we have the following to say:

To meet the growing fondness for Decalcomanic ornamentation, a plain pottery is manufactured in classic shapes and at inexpensive rates. It is prepared for use both glazed and unglazed. The former is chosen for the immediate transfer of pictures that are purchased already shaped in proper outlines or are cut from colored or ink prints, photographs, gilt, silver and glazed paper, also wad paper, Chinese *crepe*, and rice paper. Calico, cambric, printed silks, brocade silks and ribbons are also used to ornament vases, screens,

tables, *jardinieres*, etc. The unglazed pottery may be washed over with thin glue-water to fill up the pores before the paint is put on, provided a different color from the burnt clay is desirable. This glue-water will make one coat of paint quite sufficient. The paint may be purchased all prepared in bottles, or the paint of ordinary use in a house may be procured. After the pottery or wood is dry of the glue, it is painted plainly with the color selected. A pale tan or *ecru* tint represents Kioto ware. Any other color may be chosen if preferred, as porcelains are now found



in all tints. Decorations like those suggested for the glazed ware, may be chosen for pottery finished in this manner, and are laid on with a flour or starch paste in which there is a little dissolved glue. Pastes prepared in bottles may also be purchased if more convenient. After the pictures are dry, a thin varnish, also procurable in bottles, or of shellac, is laid over the entire vase or plate or whatever is decorated. This finishes it to resemble porcelain or delf ware.

Figure No. 1.—This is a vase of Phœnician shape. It may be very properly left of the natural tint of the clay, and all the ornamentation may be black. This may be done with the black Japan varnish and a tiny brush. The effect will represent the antique with satisfactory fidelity. As this shape has been reproduced in modern wares at Sevres, Jassy, Limoges, Dresden, Berlin and England, it has been richly colored and high-

ly enameled in many styles of decoration. A medallion, with a "gray and gray" photograph, a painted miniature or a printed face, is effective upon its side, instead of a bouquet; although flowers, singly or in clusters, with their natural hues, are a much-admired ornament upon it. The borderings may be cut from gilt, silver or colored papers and pasted upon it, or papers already cut may be purchased at small expense at the shops where the ware is selected. The sizing of the article with glue, the painting, and the addition

of a coat or two of varnish to finish it, have all been explained. The colors of a vase should contrast pleasantly with the general colors of a room, except in such instances as pale-blue, rose-pink or gold-colored apartments, when they should match the tints about them with exactness. This rule for artistic effects applies to all styles of vases, and indeed to all articles that are purely ornamental.

Figure No. 2.—This vase is Egyptian and also Moorish in outline, and was much in use to hold the ashes of the dead. It was one of the earliest of the many urn shapes, which increased in variety and picturesqueness as the centuries grew in number. It is often painted black all over, and the figures are afterward formed by scraping

away the color with a sharp instrument. When more convenient, the light-colored ornamentation may be pasted on in dull reds, if the original Egyptian or the Moorish idea is to be preserved.

If the decorator be indifferent to the continuance of early ideas in art, any brilliant colors may be added by transferring pictures of foliage and flowers to its sides. Patterns traced upon plain paper may be selected from laces, frescoes, or anything that is pretty and graceful, and then cut into shape before the paste brush is applied.

This vase is sometimes chosen of very large size, and decorated and finished in any agreeable colors and placed in the hall to receive dripping umbrellas. Of course, the furnishing of the hall will be consulted when its tints are selected. Sometimes a monogram of the resident of the house is arranged in black upon a gold medallion, or the letters in gold or other color are placed upon a black medallion at the side, when the same two colors are chosen as borderings.

If the vase is painted in pale hues, the ornamentation is pretty in black or all-white, in silhouettes, in traceries of foliage, or in the forms which are called arabesques and used by the Arabs and Moors. The latter people were forbidden by their religion to picture anything that had life, and hence their ingenuity is highly developed in pretty shapes and fanciful outlines.

FIGURE No. 3.—Here is an article decidedly French in its form, and its ornamentation is suggestive of both the Egyptian and Gothic. The style of decoration is both pleasing and fashionable, but it is not of necessity confined to this shape, nor is the vase limited to the illustrated method of being beautified. It is one of those outlines that are adaptable to the fancy of every ornamenter of pottery.

A plain band of gold at the top and bottom, with bouquets, a medallion with a face upon it, a monogram, a picture of a favorite dog or cat, birds or indeed anything that pleases the fancy, may be placed upon this ornamental article of pottery. It is called a flower-pot or a *jardiniere*, because it is oftener used for the growth of plants than for a simple decoration.

FIGURES NOS. 4 AND 5.—These are both antique forms, lately reproduced, because we are passing through an era of admiration for the old without regard to whether it has or has not sufficient claims to our devotion. They are restorations of forms from Pompeii and from the ancient Greek. Other nations of the same date as Pompeii also possessed them, although their origin was most likely in Italy. They are forms that are seldom ornamented in flowers, but they are handsome with grotesque figures in black or dull gold, and also in *lapis lazuli* on a dull red ground. For the growing of flowers, or for dried grasses, pressed foliage and wax flowers, they serve the part of vase or *jardiniere* with agreeable effect. No. 5 is especially handsome when supporting the roots of a growing vine, such as German ivy, Japanese fern or smilax.

Plates, modernly styled *plaques*, are among the decalcomanie favorites. Flowers, photographs of friendly or admired faces, pictures of domestic animals, etc, are placed in the center, and the edges are bordered or painted to suit the taste. Sometimes the edges are left plain with fine effect.

To use a photograph upon pottery, provided the picture has been mounted upon a card, lay it face downward in a bowl of clean water and permit it to remain all night, or even longer if needful. When it has been soaked long enough, it can be shaken off the card into the water. If it is removed with effort, it is likely to be injured. The water will separate it, if time enough be given to its dissolving power. Dry the photograph and then brush the back of it with mucilage, and let it dry again, being careful not to allow it to wrinkle during the drying, after which it is ready to be trimmed and pasted to the plate or vase.

Tables, fire-screens, etc., are finished in decalcomanie style, with pretty effect. It is a pleasant method of mounting family groups of pictures, and if applied for, photographs will be furnished unmounted at the photographers. When wood is used, coats of paint are required before the pictures are added to it. Varnish in two coats should suffice as a finish.

Catalogue of illustrations here given of the Albert ware.

15 represents an Egyptian Amphora.

24 a candlestick with snuffer and match-safe.

32 a Greek vase.

57 an Egyptian vase.

101 an Etruscan card receiver.

115, 111, 2, 555, 601, vessels discovered by Prof. Schlieman on the supposed site of Troy.

Thanks are due Messrs A. H. HEWS and Co., North Cambridge, Mass., for cuts of the Albert ware which are published, and also S. W. TILTON and Co, Boston Mass., for their Book of Designs and Illustrations for Decorating Pottery from which I have extracted largely in this article.

It will give me great pleasure to answer any questions on subject of the history, uses, or methods of decorating pottery that RURAL readers may feel disposed to ask. FAITH RIPLEY.

TALKS ON TIMELY TOPICS.—No. 4.

ROSE GERANIUM.

Willow Baskets.

WE want to tell the RURAL readers how these conveniences are made. Will the one who so gracefully presides over our circle permit it?

Very dear they have been to our heart, with their graceful white curves, their smooth, glossy polish, and subtle, dainty fragrance. Their very sight recalls to memory spring-days shining away back over little girlhood, when we pressed the faint green meadow-grass with fitful steps, and hunted blue-eyed violets and tawny willow-waste together! In those days we carried our treasures to a dear, peaceful little log cabin, and left them for transformation. And if we loved willow baskets for no other reason, we would still cherish them as a reminiscence of that tiny palace of logs. Can we admit that it was only such, and yet show it to your vision as it dwells in our own? * * * So cleanly were its ragged brown walls, over which red honeysuckles and pink "multifloras" clambered! So guileless of cobwebs were those eaves where the brown wren builded! So green, oh! so velvety, grew the short grass over the door-yard, and along one side; just within the brown rail-fence rippled a tiny brook which in all the world, my dears, has no counter-part. Have we not tested the matter? Did we not forsake full often, the shadow of the porch, and the weaver plying her art, to run under the flying snow of apple blossoms, and quench romantic thirst with water which the brown gourd dipped from its fountain-head?

Behold the College of our learning! Now for the learning; for, in rather ungrateful disregard of her life-long self-sacrifice we overlook our gentle teacher. (Heaven found and took her long ago!)

Come with me, in fancy, and we will pull the willows for ourselves. You see how daintily the slender last year's growths snap and are off, as though falling into your hands were a genuine pleasure. We must carry home a generous bundle for two or three baskets seem to naturally grow from one attempt—a sort of inevitable tendency to cluster. If willows ever do bear baskets you may expect them in bunches of from three to half a dozen.

The porch is the place to sit just now. While the ground is still damp we should have a floor beneath. Yet, with a sky so bright, we need but little roof above. And it is well we delayed our gathering no later, if the leaf buds are allowed to progress too far, our wands will be brittle and there will be consequent annoyance. We must assort them—chosing the most slender for bottom weaving and those which are longer and stronger for the the braids.

We must curl them in a kettle, cover them with water, and boil them—sufficiently. We determine this point by and by. If some one will agree to tend the fire we can have time to whittle the hickory pincers necessary to the "peeling" process, and afterwards take a little nap, or try two or three bits of new music.

Now, we seize a willow and place its base between the jaws of our pincers.

"What are they like?"

Oh, nothing very formidable. Only a hickory peg a few inches long, smoothed off and split half way up. We compress the jaws of this unique agent, and draw the willow through. If the bark peels readily, the boiling may be discontinued. However, don't lift the wands from the water, but keep them covered, and throw the peeled ones into a tub of clean water.

Select from thrifty, unboiled wands eight uniform pieces nine inches long, and when scraped white, as thick as a turkey-feather quill. With a sharp knife trim four along an inch of the middle, until they are slightly flat. In a corresponding part of the others cut slits. (Look in the bottom of any basket, my dear, for a pattern.) It is best, after you have prepared your frame, to wrap a bit of fine, strong twine securely around it to give additional strength before the weaving is commenced. When the bottom is complete, select two strong willows for each end of the rib, shave the ends, press them firmly in. Your structure is, at this point, somewhat spidery in appearance and rather hard to compose. However, it won't bite; so, sieze bravely hold, and bend the ribs together! Bind a strip of cloth around to keep them in place. Oh, of course you can use a string, but of course it will slip off!

Now, weave a strip about two inches high. Do not separate the pairs of ribs! When your work is complete, you are ready for the braid. Choose from six to ten willows for each cluster.

And now—if you have ever seen a willow basket, you will perceive how to twine the clusters, in and out, and out and in, until the tops all point downward; you will understand how to work them up again and down once more, and cut them off for the last touch. If you have no pattern, instinct may teach you. If she fails, you will have to throw the whole affair away! Our pen utterly fails us further in the way of description.

Should the baskets ripen, set in one a shallow dish, and all summer long enjoy the little blessedness of a rustic basket of flowers. Devote one to yellow peaches and red apples, and another to your grandmother's knitting. This last will be the sweetest work of all!

BEAUTIFUL WOMEN.

ONE thing may be particularly noticed in English women. The mouth, when beautiful, is absolutely statuesque. The curves are decided, and at the junction of the red of the lips with the white, there is a delicately raised outline which marks the form of the feature in a very noble way. This may also be said of the nostril. It gives a chiseled effect to those features, which is not so often found elsewhere; but the nose itself, the brow, and the set and carriage of the head are generally finer among Americans.

In both countries, however, the head is apt to be too large for perfect proportion. This is a characteristic defect of the English type of beauty. Then, again, the articulations are heavy. Really fine arms are rare; but fine wrists are still rarer. Such wrists as the Viennoise women have are almost unknown among women of English race in either country. It is often said, even in England, that American women have more beautiful feet than English women have. This may be doubted. The feet may be smaller, but they generally look smaller because English women wear larger and heavier shoes.

Literary Miscellany.

"LET THE DEAD BURY THE DEAD."

'Tis gone, with its joys and sorrows,
Its sunshine and storms of rain:
Look not away in the distance,
On relics of grief and pain:
Look up, dear friends, instead:
Let the dead year bury its dead!

What if our pride have suffered,
What if the hour of need
Have shown that the friend we trusted
Was worse than a broken reed?
Look up, though our hearts have bled:
Let the dead year bury its dead.

Let us count the abundant mercies
Our one great Friend has sent;
The days of our light and darkness—
All gifts of one sweet intent.
No matter the tears we shed:
Let the dead year bury its dead.

Ah, youth has been taught stern lessons,
And we of maturer years
Have learned a yet keener knowledge
Of life's vain hopes and fears.
How surely God's hand hath led!
Let the dead year bury its dead.

And the new-born year shall find us
Courageous, alert, and strong;
Girt up for the strife before us,
Though sharp the trial and long.
On, on, with a firmer tread,
While the dead year buries its dead.

CORA.

CHAPTER 1.

"Now, Hal, do be amiable for once, and accede to my very simple request?"

"For once, you ungrateful puss! When do I refuse any reasonable request of yours?

And Harold Sinclair turned away from his easel and faced his sister (as she stood behind him), brush and pallette in hand, and a complete expression of mingled severity and gentleness on his face.

"When?" she answered laughingly. "Never, of course, so do not begin now, but like the self-sacrificing brother you always are, put away that horrid painting, and take me up to town to see the illuminations."

And Cora Sinclair enforced her pleading by kneeling down beside her brother, and bringing her face on a level with his shoulder, lifted her beautiful dark eyes, half-entreating, half-triumphant to his relenting face.

A more beautiful pair of people could hardly be imagined than this brother and sister, although no one looking at them would have imagined that any relationship existed between them, and the few friends and clients whom the young artist received and introduced to his sister were always surprised when they made Cora's acquaintance.

Harold Sinclair was one of those to whom one would instinctively ascribe pretty sisters, but the contrast between himself and Cora was remarkable, and one could not help a feeling of disappointment, and the wish that he had another sister of the same grand Saxon type of beauty as himself. About the medium hight, and rather slenderly built, his figure had hardly attained the massive, stately proportions one ascribes to our Saxon ancestors, but his face was one of the purest Saxon type; his eyes, blue and sparkling; his waving hair of the fairest golden hue; his complexion, pure and brilliant as a girl's.

Cora, on the contrary, was more a brunette than a blonde; her hair was of the darkest brown, gleaming with a tinge of gold when the sun touched it; her complexion was of that warm, clear paleness the Italian masters loved to paint; and if her features were less regularly beautiful than Harold's, any irregularity was fully atoned for by the wondrous dark-gray liquid eyes, fringed by long black lashes, which cast a shadow over the fair cheek.

"I wish you would not urge it, Cora," he said, with a last feint at resistance. "You have no idea of the unpleasantness—to use a mild term—of a crowd on such an occasion. Why, my child, people are often killed, crushed to death."

"Oh, don't be so absurd, Hal," she replied, pettishly: "one would think you were a malden aunt from the tone of your forebodings. Just as if I had never been in a crowd! I remember quite well being in a huge crowd one night at the Champs Elysees on the Emperor's fete, and papa lost me, and I was only ten, but I enjoyed it very much, and people were quite nice about the pushing: I was not jostled a bit more than was agreeable."

"French and English crowds—" began Harold.

"Oh, yes, I know all about it," interrupted Cora, laughing. "They are very different, and English crowds are much the nicest. Hal, dear, do be kind and take me. I don't have much fun down here."

"I know that, dearest child," said Harold, sadly. "I wish I could make things brighter for you."

"Hal," she interrupted, impetuously, "you know you are a million times too good to me! There, I don't care to go a bit if you do not wish."

"I would take you in a minute, Cora," said her brother, after a moment's pause, during which time she had danced a merry *pas seul* round the sitting-room, pausing at his side, and looking up laughingly into his musing face, "but I am really afraid of a crowd for you. We might get separated—you might faint."

A peal of merry laughter rang through the room.

"Have I ever fainted in my long life of nineteen years and a half?" said Cora, scornfully. "You must have a bad opinion of your sister's nerves. You are about as likely to faint yourself as I am. Are you going to take me, brother mine?" And she assumed a pretty attitude of determined wilfulness. "Or must I go by myself?"

The words sounded self-willed enough, but the expression of entreaty and affection in the sweet dark eyes belied them.

Harold smiled as he contemplated the graceful figure in its pretty, artistic dress of dark-blue serge, enlivened at the throat by a knot of ruby-colored ribbon, which fastened her plain linen collar; a dress simple enough, yet not without a grace of its own, besides that which it borrowed from its wearer.

"Thanks, brother mine," said Cora, noting the smile. "I will go and get ready at once."

"Wrap up well, little girl," said Harold, then, rising, and beginning to put away his painting materials, while his sister ran away to get ready.

Harold and Cora Sinclair were orphans. Their mother had died at Cora's birth; they had lost their father about six years previous to the opening of our story.

Reginald Sinclair was the younger son of an old and wealthy English family, but he had married a young Italian actress, and his family had disowned him for the misalliance—if one can give such a name to such a union.

Clara Visconti had possessed great beauty and talent; her professional career had been very unusually brilliant, but she had been quite willing to give up her laurels and triumphs for the love of Captain Sinclair, and the quiet home he offered her.

During the few years of happiness she had enjoyed with her husband, she never once regretted the luxury and pleasure of the life she had renounced. Her husband's admiration was enough for her; his appreciation of the beautiful voice which had made plaudits issue from a thousand throats, sufficed for her ambition; and when she lay dying, with her hand in his, she was able to say, with a smile, truly:

"I have been so happy with you, *caro mio*, it seems hardly possible that I can be happier where I am going."

And the beautiful dark eyes turned to him with one last look of love ere the veined lids closed over them for ever.

Reginald Sinclair never fully recovered his wife's death; all the sunshine and beauty of his life passed away with her lovely face and soft voice, and when he saw her no longer, it seemed as if he had but to lie down and die. But there were other uses for his life yet.

The brave, handsome boy, Harold, was but six years old when his sister was born, and Reginald Sinclair had the child—with her mother's wistful, lustrous eyes—to win him back to brighter things. Harold was nineteen, his sister six years younger, when they lost their father; and during the six years which had elapsed since his death, Cora had had no other guardian but her brother.

Well and truly had he fulfilled his father's trust, and no father's care—hardly a mother's—could have been more tender or more guarded than Harold's. They had retained the pretty, old-fashioned cottage midway between Richmond and Kew, where they had lived ever since Captain Sinclair's return from abroad, and it is there we found them on the 10th March, 1863.

Harold had adopted the profession of an artist, and already, young as he was, was adding sensibly to their small income by his professional earnings. The Tryst was a happy home for Cora. She had few friends, and now, since the departure of her governess, had but one constant companion, an old Italian servant, who had been her mother's nurse as well as her own, and who loved Harold and Cora for her dear sake.

"Here I am, Hal," said his sister's voice, breaking in upon his reverie, as he stood at the bow-window of his studio looking out on the dreary March landscape. "Remember, we have to get to the station to catch the 7 o'clock train. Marianna is shaking her head, and looking like an owl in an ivy-bush at such a rash proceeding. I think she is more surprised at you than at me."

And Cora's eyes danced under the shade of her sealskin cap as she drew on her little fur-lined gloves, and Harold donned his great coat.

The railway-station was tolerably crowded, and Harold had some little difficulty in obtaining places in the up train; but they were off at last, and half an hour brought them into the heart of London.

At first Cora enjoyed the excitement and novelty of the crowd, which was not so great as Harold feared it would be later.

"I want most of all to see Temple Bar, Harold," she had said; and they had gone city-wards with the greater mass of the people. Harold had put his arm round Cora, and the pleasure both felt in the contemplation of the illuminations, and the weird effect they had in their contrast with the deep blue of the sky, made both for a time insensible to the crush and discomfort of the crowd.

Very slow was the progress made by the moving mass towards Temple Bar, and Harold felt that the crowd was gathering and increasing as they went along, borne forward irresistably by the immense concourse of people. Glancing down at his sister's face he saw that she was looking a little pale and startled, as if but now stricken with a sense of their helplessness and inability in such a crowd. The people were getting more noisy too; more than once words which Harold hoped his sister did not hear struck upon his ear. Many of the sight-seers were people belonging to the great middle class, but the greater number were in a station, considerably below it

and were not always choice in language and expression. Once or twice Harold felt his sister shiver and press more closely to him; but when he stooped his head to give her an encouraging word or two she flashed back a smile and a merry reply.

Just as they neared Temple Bar, there was a stoppage; it was evident that there could be no advance or retreat, and yet those behind pushed forward, those in front backwards; so that one of those surging movements common in a crowd made itself felt all along the dense masses which thronged the street.

Closer and tighter became Harold's clasp of his sister, and intense was his fear that she should be hurt, as he felt how painful the pressure and crush were to his own stalwart, well-knit frame. The hoarse murmurs deepened around; the multitude, like so many living waves, surged to and fro, and Cora began to feel stifled, and a longing for fresh air came over her. She could feel the hot breath on her cheek, the huge arms thrust near her face, the heavy tread on her little feet, and her repentance for her wilfulness was very sincere just then.

Anxiously Harold glanced around, and longed for a passage through the crowd; but great as his strength was, it was all required to prevent the delicate girl by his side being seriously hurt by the rough movements of those around her.

"I am so sorry, little sister," he said, bending down "It will be less dreadful in a few moments. I will take care of you."

"I am not afraid, Hal," she answered, lifting her eyes, with a forced little smile. "Look how beautifully those two letters are interlaced. What a pretty monogram they would make!"

Brave as Cora tried to appear, she could not quite disguise the trembling of her voice, nor force back two large tears which welled up into her gray eyes, and hung for a moment on the long dark lashes.

Harold saw them, and felt very angry with himself for having yielded to her request.

"If I could get you out into one of those quiet side streets, Cora," he said, wistfully.

"Don't try, Hal; you might get hurt, or I might lose you," she replied.

After this there was a short silence; neither spoke again until a sharp, shrill cry of anguish rose in their immediate neighborhood, and all personal anxiety was momentarily forgotten. A delicate-looking woman, holding a child in her arms, had been unable to support the pressure and jostling around her, and had felt the little fellow she carried slip from her feeble grasp, and knew that both were in danger, imminent danger, of being crushed to death and trodden down in the eagerness and impetuosity of the moment.

"Help me! oh! help me!" she cried, faintly. And instinctively Cora Sinclair unclasped her hands from her brother's arm.

"Harold," she said, eagerly, "help her. I am all right. Look! look!" she went on, with feverish eagerness, "she is fainting; she will be killed, and the child."

Reluctantly, and yet moved by a stronger feeling which he could not resist, Harold, as he released his sister, managed to seize the child, and then turned his attention to the mother.

"Keep near me, Cora," he said earnestly, as he caught the drooping form of the poor woman, and in a louder voice appealed to those around him to make a passage and allow them to get to one of the deserted side streets. His words were not quite without effect; but in the movement of the people around, who tried to accede to his request, Cora found herself borne irresistibly forward several yards, and entirely separated from her brother.—[To be continued.

LOVE'S A. B. C.

"Going to Europe?"

The speaker was one of two gentlemen sitting at an open window on the second story of the "Ocean Hotel," Long Branch. Both the young men were smoking.

"Yes; I am going to Europe," was the reply. "I will be frank with you, Charley, for we were at school together, were chums at college, and have been close friends ever since. I will say to you what I could say to no one else; and I feel I must unburden myself to somebody."

"A woman of course?" said his friend, sententiously, selecting a fresh cigar.

"Yes; a woman."

"Miss Temple?"

"Isabel Temple."

"Just as I supposed. But look here, Hal, is she not a bit of a blue-stocking?"

Harry Darnley winced. He could not bear that anyone should speak disparagingly of the woman he loved; and Charley Rossiter used the phrase, he knew, disparagingly.

"I do not think so," he answered. "She ranks intellect above all else; is fond of the society of men of ability rather than that of mere boys; likes, in fact, to talk of things not persons; in other words, is no gossip, as so many women are. If that is being a blue-stocking, then she is one?

"Precisely. Reads Darwin, Herbert Spencer, and Huxley. I don't mean to be offensive, but isn't this your half-fledged female lecturer? Before long, mark me, she'll be haranguing from a platform, probably in full Bloomers, with a monkey-jacket and a man's hat."

Even Harry could hardly repress a smile. But he replied, warmly:

"You do her great injustice. She is a thorough woman at heart, with infinite capacities for sympathy, self-sacrifice, tenderness, devotion. Only nothing has yet touched her deeper nature——'

"You mean that no man has ever yet won her love," interrupted Charley.

Harry finished, without noticing the interruption: "As she is full of character, she feels the need of doing something; and so throws herself heart and soul into all the movements, from the Radical Club down."

"Oh! yes; goes to feminine conventicles, where they read poems and essays, admire each other, and listen to transcendental fools lecturing. Faith, Harry, I thought you had more sense than to fall in love with a girl of that kind. Grant she is pretty, charming fascinating, even: I am quite ready to admit the two last, and I know she is beautiful; but for Heaven's sake don't marry any woman who thinks more of herself than she ever will of anybody else."

Harry took a turn up and down the room to calm his irritation, regretting that he had made a confidant of this cynical Charley.

"You entirely mistake her," he said, at last. "You should see her in the privacy of her home, as I have; for I first met her a year ago at her father's country-seat. Her little sisters fairly worship her; so do all the poor of the neighborhood. A woman more free from affectation, or who is less self-conscious, never lived"

"And she will have none of you?"

"In every way I have shown my love, but she will not let me speak. She seems to wish to spare me a refusal, and in that reveals the delicacy of a true woman."

"Well, old fellow, I'm sorry for you. You're not the sort of man either that really first-rate women dislike; and that convinces me that you overrate this Miss Temple. If she knew you as I do, she'd crawl on her hands and knees to beg you not to go away, but to remain here, and live for her."

"Some day," said Harry, with a sigh, "she'll find she has a heart; and then you'll see how you have maligned her. She's the sort of a girl to die for the man she loves."

"Stuff and nonsense! She'll die for nobody unless, when older, she dyes for herself: pardon the pun, I know it's intolerable, but it's good enough for her. I only hope her hair, instead of coming out chestnut color, will come out blue. Ha! ha!"

"You may laugh at women who are intellectual, and sneer at them for blues," answered Harry, sternly; "but for my part I wouldn't marry one who wasn't. Think of being tied for a whole lifetime to a silly woman. But with one as bright, as full of spirits, as cultivated as Miss Temple, for a wife and companion, one's home would never grow dull."

"'A perfect woman, nobly plann'd
To warn, to comfort, and command.
And yet a Spirit still, and bright,
With something of an angel light.'

Heaven bless her! I hope the man who wins her, when I'm far away and forgotten, will be worthy of so rich a prize."

"I wish him joy of his icicle. The cold glitter of steel; all brains, no heart. She isn't capable of learning even the A B C of love, and never will be. Forget her, Harry."

"Well, we shall never agree on this subject, so let us drop it, and forget I ever spoke. What say you to a stroll on the Parade?"

"With all my heart," was the response.

"I shall see her to-morrow for the last time," said Harry, in conclusion. "There's to be a picnic at Paradise Rocks. After that—well, Europe."

Little did either of the speakers imagine that there had been a listener to their conversation, much less that the listener was the very lady under discussion. But so it was. Miss Temple had come to call on a friend at the hotel, and finding her out, had sat down at the table, in her private parlor, to pen her a note. Now this parlor was the next room to that occupied by Charley Rossiter, and as the windows of both apartments were open, she heard distinctly every word that was spoken. It was Harry's admission that he was going abroad, which first attracted her attention.

A sudden pang shot through her heart, a spasm of absolute physical pain. Harry had been so devoted to her for more than a year, that she had taken it for granted he would always be so. She had, therefore, no wish to change these pleasant relations; as Harry had said, she shrank from him when he became too demonstrative; but now that she found he was going away, she awoke to the consciousness that he was necessary to her happiness, and it burst on her like a revelation.

She listened, spell-bound, to what followed. It never even occurred to her that she was eavesdropping; she was too intensely absorbed. While her cheek flushed, half angrily, more than once, at Charley's cynical criticisms, her heart throbbed with strange pleasure at Harry's generous defence of her; the more generous she felt because he admitted that he was without hope. And it began to dawn on her that she had been, unintentionally, a little selfish in expecting to keep him at her side, on her own terms, receiving everything and giving nothing. She saw, too, that she had misunderstood herself. She had been saying all along, and her set had said it also, that only weak, silly women fall in love; that men were all alike selfish; that her sex were the victims of their affections—"too emotional altogether," as the high priest of the æsthetic Club put it. It should be her care, Isabel had early declared, to avoid this weakness. Life surely had enough in it, even for a woman, without the need of love. But now her fine-spun philosophy fell from about her. Now, when one whose society had, somehow, become essential to her, talked of going away for ever, she suddenly discovered what a dreary waste of years lay before her—what a hopeless, purposeless future. And she compared Harry, mentally, with the other men she knew, realizing, as she had never done before, how superior he was to all of them; nobler, truer, manlier, more intelligent, better cultivated, chivalrous beyond words—a Sir Launcelot in all that was great and good. And she blushed, with secret pleasure, as she thought it.

But he was going away for years. It was too late to recall the past. Yet there was one hope—a slender one, but still a hope. They were to meet to-morrow at the pic-nic; and though she could not take the initiative, yet something might happen. Perhaps—perhaps——

Suddenly she roused herself, with an effort, for she had been thus musing for long after the two gentlemen had gone out, and rising, ran downstairs to her pony-phæton, feeling like some guilty thing, all at once remembering that she had been eaves-dropping.

There was a great dinner-party that day where Isabel was a guest, but everybody remarked that she was not herself. She was dull, spiritless, absorbed. Her usual gay sallies, her contagious wit, were absent. Little sleep visited her eyes that night. She was thinking all the while that she had discovered her secret too late; she called it a secret now; a week ago she would have called it a weakness. Harry was going, and might go, was almost certain to go, without a word.

She dressed for the picnic next day with the greatest care. She was in a fever when she reached the rocks till Harry made his appearance, for she feared something might happen to prevent his coming. He did not, for awhile, join her; and she was in a fever of apprehension till he did. When, at last, he came up, she welcomed him with a bright smile; and from that moment she was the gayest of the gay. Never had she been more brilliant. Half a dozen of the most intelligent gentlemen present were about her; she had a retort for each; the ball of conversation never flagged for a moment. But, with all, she was restless. She was hoping that Harry would give her a chance to see him alone; but he made no movement to do so.

"Why does he not ask me to go for a walk?" she said to herself. The afternoon was rapidly passing; her hopes began to grow faint: she resolved on a decided step.

"How very warm it is," she cried, fanning herself vigorously. "I wonder if there is more breeze on the beach."

Immediately her attendants, one and all, offered to escort her to the shore—Harry among them. She put her arm in his.

"I will accept Mr. Darnley's kind escort," she said, bowing gracefully to the rest. "They tell me he is going to Europe, and it will be my last walk with him. The rest of you I can see dozens of times yet."

The others took the hint, and bowing, left Isabel and Harry alone. Neither spoke until they had left the noisy company far behind them, and quite out of sight, and had reached a rocky bluff, with the low, level sands stretching before them, and the long line of breakers whitening in the distance.

"Let us sit down here," said Isabel.

They sat down, and, as the sun was still warm, Harry put up her silk umbrella, and held it over her. Still he did not speak. Something in Isabel's manner began to give him hope, yet he could hardly believe it; and he feared to spoil all by precipitation.

"Are you really going to Europe?" said Isabel; and her voice trembled a little in spite of her effort to be calm. "Is it not very sudden?"

"It is sudden; but it is the only thing left for me to do."

"Why?"

There was a tenderness in the tone that was unmistakable, and such as Harry had never before heard. He looked at her suddenly and keenly. Her face grew crimson with blushes; her eyes fell; she turned half aside. Then, as if hardly knowing what she did, she began to draw lines in the sand with Harry's thin bamboo cane, which he had put down when he opened the umbrella.

A wild, desperate resolution took possession of her companion. He was no faint-hearted knight; but, as he had told Charley, never before had Isabel given him even the slightest encouragement to speak as a lover. At this sudden shyness on her part he took courage, and resolved to peril all "on the hazard of the die."

Only those who have been in such straits themselves, hoping and yet fearing, but fearing more than they hoped, can know how he spoke. His earnestness, his passion, made him exceptionally eloquent, even for himself.

Isabel listened with a beating heart, and with fast-changing color. He told how long he had worshipped her; how her coldness had driven him to despair; how, being about to go away for ever, he could not leave without saying all this, even though he had no hope.

"Some happier man," he said, in conclusion, "will yet touch your heart. I shall not hate him. I love you too purely for that. Heaven bless you both!"

She made no reply. But if Harry could have seen her averted face, he would have seen that tears were in her eyes. After awhile, however the tears ceased; a look of perfect happiness irradiated her countenance; and then a roguish smile began to play round the corners of her mouth. She stopped, and traced, once more, something in the sand. But what she traced now were large Roman letters—the letters "A B C."

"Haven't you even a word for me?" said Harry, after a pause. "I haven't, at least, offended you?"

"I have some letters for you, as you may see, if they will do," she answered, looking up with a mischievious smile; and then she demurely finished off the tail of the C.

What did she mean? Enigmatical as were the words, the look made his heart beat high. He leaned towards her. She did not move away. He put his arm about her. She did not shrink; on the contrary, she said, in a low whisper:

"Will you—give—up—going away, if I ask you?" And her appealing look was even more eloquent than her words.

"I will give up my life, even," he answered, passionately, pressing her to his heart.

She lay passive for a few seconds with her head on his breast; then made a faint effort to release herself.

"Not yet," he said, holding her fast. "Not till you have told me that you love me. It seems to good to be true. My happiness would be too great."

"You must not hurry me," she answered, with a saucy, bewitching glance. "Don't you see I am only at the A B C?"

The look of those splendid eyes, her sweet head on his cheek, the close proximity of her tempting, inviting lips were too much for him. What could he do but kiss her?

"There, that will do—at least, to begin with," she cried, laughingly, but blushing crimson; and extricating herself, with a sudden little movement, from his arms, she said: "You, at least, understand the A B C."

He looked at her with such a puzzled air that she broke into a peal of laughter.

"Don't be angry," she said. "I am not laughing at you. I was in a room at the hotel yesterday, next to that where you were sitting. It was Carrie Stewart's room, but she had gone out, and I was sitting at the table, writing a message to her, when I heard your voice. You understand now. The windows looking on the Parade were open in both rooms, I suppose; you must be more careful, Master Harry, in the future. And it was then I heard the talk about the A B C of love." And she laughed mischieviously again.

"What a veritable sprite you are," he answered, joining in the laugh. And catching something of her sportiveness, he said:

"But you must be punished for eaves-dropping." And he caught her once more in his arms, before she could elude him, and kissed her again and again.

"Oh! but you're getting beyond the A B C," she said. "Surely one—is—quite—enough."

"One will be; or I suppose will have to be," he answered. "I am waiting for it."

She opened her eyes wide.

"Waiting for it? Haven't you had—a—a dozen?"

"Yes! maybe. But none from you."

"Oh!"

"Certainly."

"From me."

"Why not?"

She pouted.

"But you love me?"

No answer.

"You love me?"

She looked up from under her half-veiled eyes, blushing rosily.

"It is not much to ask," he said, "is it? It's only the A B C, you know."

"There, then," she said, "that's the A. We'll see about the B and C by-and-bye, perhaps, if you behave yourself;" and she glided from his arms again, and stood like a laughing Grace, full two feet distant.

And there we leave them. But Harry was right. Isabel, once having loved, loved with her whole soul.

"She does nothing by halves; she learned the entire alphabet, by Jove!" said Charley, speaking of it many years after. "She didn't stop, as namby-pamby women do, with the A B C."

BRIC-A-BRAC.

BY C. H. E. R.

We are all greater dupes to our weakness than to the skill of others; and the successes gained over us by the designing are usually nothing more than the prey taken from these very snares we have laid ourselves. One man falls by his ambition, another by his perfidy, a third by his avarice, and a fourth by his lust. What are these but so many nets, watched, indeed by the fowler, but woven by the victim?

The following translation was made by a Frenchman who professed to teach languages, and who thought he was telling a story in really beautiful English:—"A lady which was to dine child to her servant that she not had used butter enough. This girl, for to excuse himselve, was bring a little cat on the hand, and told that she came to take him in the crime finishing to eat the two pounds from butter who remain. The lady took immediately the cat whom was put in the balances, it just weighed that two pound. 'This is all the very much well for the butter,' the lady then she said, 'but where is the cat?'"

One often hears of "touts" and "touting." The word came into use in this way:—In the reign of Charles the Second, the Londoners east of Temple Bar used to flock to Epsom to drink the waters, as their West End neighbors did to Tunbridge Wells. On their way they were met at *Tooting* by a crowd of lodging-house keepers, tradesmen, etc., with so many clamorous importunities for patronage, that the word "touting" is derived from the name of the village where the practice was carried on. At least, so says Mr. Peter Cunningham.

The Querist.

ANSWERS TO CORRESPONDENTS.

Hen Manure.

F. C. M.—I have about a dozen barrels of pure hen manure; will the RURAL please tell me what is the best thing to mix with it, and in what proportion, for general use?

ANS.—Dry muck is, probably, the best thing to mix with hen manure. Let the mixture lie in a heap until it heats. Then work it over and mix with more, repeating the operation two or three times, until the dung is mixed with fully four times its weight of muck, which will probably be eight times its bulk. If muck is not handy, soil or coal ashes will do instead; common barnyard manure will also answer very well, and the compost will be very rich.

Applying Liquid Manure.

W. H. Stoughton.—What is the best way to apply liquid manure on my garden patch?

ANS.—Having collected the liquid manure in, say, a barrel, as if for a leach, draw off the strong liquid from the bottom; and having diluted it to the color of ordinary tea, apply it to the plants only when they are in a growing state. If used when drought has checked their growth, it will prove injurious. On such a small scale as you need it, the best way of applying it is by means of a watering-pot. Draw away the earth from around the roots of the plant, apply the liquid manure, and when this has soaked away, replace the earth. An application twice a week is quite often enough.

Soft-Shelled Eggs.

R. C. M.—My hens lay a great many soft-shelled eggs. Will the RURAL please tell me a preventive?

ANS.—Give your hens powdered oyster or clam shells, lime, finely powdered bones, or marble dust, mixed with their feed.

Miscellaneous.

J. M. A.—Can the RURAL give me any information as to the actual cost of carrying freight and passengers a hundred miles?

ANS.—We presume our correspondent refers to railroad transportation. Reports are annually made by the different lines of their running expenses, and a little figuring with regard to any of these will give, pretty closely, the information our correspondent is in search of.

S. C., Brooklyn, N. Y.—I wish to have a bed of Snow-drops and Crocus this coming spring, but as I can't plant them *now* in the spot where I would like them to blossom, will the RURAL be good enough to tell me whether I could start them in the house (cellar) and transplant them in February or early March?

ANS.—Yes, you could do this but transplanting would injure the roots and the flowers, unless, they were planted in little pots and thumped out with the earth intact. It seems to us the plan will give you more trouble in its execution than the results will be worth.

Subscriber, Lynchburg, Va., wants a cure for a horse that is going blind. He had better look in the animal's mouth, and if he finds an extra tooth in front of the grinders, let him pull it out, on the upper jaw on each side, and I think his horse's eyes will get well. Have had *experience* in that direction. Any one who has a colt that was a year old last summer, can find them now, and they ought to be pulled out at once. A. W. H.

Greenfield, Mass.

J. D. G, Meadville, Pa.—Please let me know through your next issue, (1.) the name of the best seed drill—for horse, not hand use.—If you do not wish to discriminate, name two or three of the best. (2.) Is there a potato digger that is a success, one for horse power I mean? What name?

ANS.—We are always glad to give all the information we can without regard to the fact we may discriminate in somebody's favor and give a little "free advertising." Our only care is to do no injustice. (1.) We refer you to our issue of Jan. 10, for description of improvement in the Albany planter which is a good one-horse implement. The RURAL of May 19, '76 will give you illustrated description. (2.) There are several potato-diggers in the market differing from each other immaterially. Allen's Potato-Digging Plow, (189 Water St., N. Y.,) is as good as any.

M. W., Poquonoc.—If you will send a flower and leaf, we can probably tell you.

A. E. C., Charlotte, Mich.—Please to tell me, through the RURAL, how much boiled flaxseed to feed to a small yearling per day. I wish to fatten it for the butcher as it does not pay to keep such stock on the farm.

ANS.—Not over a quart and then it ought to be mixed with some coarser feed, beginning gradually.

T. W. M., Liv. Co., Mich.—Will want a quantity of field and garden seeds soon. There is so much bogus seed on the market, want to know where the best can be obtained. Want to know who has an incubator for hatching at least 300 eggs. Would like to raise poultry by the thousand. Do you know of any incubator that hatches a large per centage of the eggs, and that does it successfully, economically, and without too much watching and trouble?

ANS.—We can not say where the *best* seed can be obtained. As regards incubators, we would refer to recent issues of the RURAL for the information desired.

Mrs. C. C. North Bass, Ohio.—Will the RURAL please tell me what is the matter with my Oleander; it seems to be growing vigorously, but the under side of the leaves is affected with a white scale, and if it is not removed by washing, the leaves turn yellow and drop off. Please give remedy.

ANS.—Scrape them off with the back of a knife and sponge the leaves afterwards. Collect the scales upon a paper and burn them. Alcohol may be advantageously used for sponging the leaves.

Reader.—Will the RURAL tell me where I can get the following grass seeds, as I want to experiment with them the coming season, and whether such mixture would be good for hay as well as pasture, on clay land?—Timothy, Red-top, Blue grass, Orchard grass, Meadow Fescue, and English Rye grass; how much of this mixture will seed four acres, and the cost? (2). What is a good remedy for lice on cattle?

ANS.—Timothy and Orchard grass do not ripen together, as the latter is fully three weeks the earliest; hence, for a meadow, it is not wise to seed them both on the same land. We would not mix Timothy with any other grass for a meadow, unless it was with Red-top. English rye grass would be likely to kill out in our northern latitudes, and in the South the climate is probably too hot and dry for it to do well. Red-top, Orchard grass, Blue grass, and Meadow Fescue, would be a good mixture for a permanent pasture, sowing one part of each to an acre, making two bushels in all; ten or twelve quarts is enough Timothy seed for an acre. Red-top is worth in New York, $1.25 per bushel of 12 pounds; Blue-grass, $2.25 per bushel of 14 pounds; Orchard grass, the same weight, $2.25; and Meadow Fescue, 20 pounds for a bushel, is worth 45c. a pound; Timothy grass, the best quality, is worth $2 per bushel. The seeds can be had of R. H. ALLEN & Co. of this city, or of any seedsman here or in the next town to you.

(2). A strong soap suds of carbolic soap will kill lice on cattle or ticks on sheep; and so will a decoction of tobacco, when thoroughly mixed with salt, also destroy them when rubbed into the hair.

News of the Week.

CONDENSED NEW YORK TELEGRAMS.

TUESDAY, Feb. 7.—There have been made some shocking revelations of the tortures to which convicts have been put in the New Jersey State Prison—burning, putting on the rack, etc.; several deaths have resulted from this official barbarity. More trouble apprehended among the Sioux: Gen. Miles has been reinforced, and is getting ready for operations in early spring.

All the Turkish men-of-war on the Danube have been surrendered to Russia, and a part if not the whole of the Ottoman fleet will also be given up as part of indemnity. The Powers that have guaranteed the independence of Greece insist that she shall discontinue hostilities. Her army, despite reports to the contrary, has not come into collision with the Turks. There are 40,000,000 bushels of wheat stored in the Black Sea ports of Russia, to be thrown on the market on the conclusion of peace.

WEDNESDAY, Feb. 8.—The silver bill is taking up all the time of Congress. Oceans of talk, with no result. The Senate Committee on Finance has agreed to Senator Wallace's bill substantially for Post-office savings banks.

Austria's invitation to the Powers to hold a conference has been accepted by Germany, France, and Italy. England will also concur. Russia maintains a war-like attitude, and reinforcements are constantly pouring into Turkey, to be prepared for all emergencies. There has been a great panic at Athens on report of the approach of the Turkish fleet. A new ministry has been formed in Turkey, responsible to Parliament, and the office of Grand Vizier has been abolished. In the British Parliament all attacks on Russia are loudly cheered. Austria insists that Russia shall not control both sides of the Danube at any place.

THURSDAY, Feb. 7.—Augustus Tourney, teller of the Bank of North America in this city, has defaulted to the amount of $100,000—a model of piety and morality!

There is a wild rumor that the Russians have occupied Constantinople. Russia objects to holding the conference in Vienna, and insists that a small town in a small State is the most appropriate place, she agrees to take part in it however. It is said Osman Pasha will be court-martialed by the Russians for ordering the execution of prisoners of war. Server Pasha, plenipotentiary to the Grand Duke Nicholas, declares that the Porte was misled and encouraged to fight on the promise of English support. Lord Beaconsfield says the statement is an infamous fabrication. Strong language from a Prime Minister of one nation to the foreign Minister of another—and everything indicates that the latter is substantially correct.

FRIDAY, Feb. 8.—Anderson, the first of the La. Returning Board tried, has been found guilty of forgery and altering public documents, and for publishing the same as true.

After a life of 85 years, and a pontificate of 32 years, and a self-imprisonment of eight years, Pope Pius IX died yesterday at a few minutes before five in the afternoon. The following additional points of the armistice conditions are asserted in special despatches to the London morning papers:—

That the railway between Adrianople and Constantinople be repaired and operated, and also the telegraph line between Adrianople and Odessa by way of Constantinople.

The raising of the blockade of the Black Sea and the Danube for everything except ammunition.

The Russians to occupy the Black Sea coasts from the Russian frontier to Baltchik, and from Missouri to Derkioj.

On the Sea of Marmora, the Russians to occupy Batjuk-Tchakmadje and Tscharkioj.

On the Ægean Sea, from Enos to Mekri.

These are in addition to the points held by the Russians at the time of the signature of the armistice.

Roumania refuses to re-cede Bessarabia to Russia. The windows of Mr. Gladstone's house and those of the Daily News were broken last evening by a furious mob in disapprobation of the Russian advocacy of the statesman and paper.

SATURDAY, Feb. 9.—Anderson of La., asks for a new trial on the ground that his conviction was against the evidence. Wells has been released on $10,000 bail. Sitting Bull, after all, is still in Canada.

Italy has assured foreign governments that she guarantees a free and uninterrupted election of a new Pope. Preparations for this are rapidly being made; Cardinals are summoned to Rome from all quarters. Cardinal McCloskey has just left this city for Europe. The body of Pius the IX has been taken to St. Peter's. The Ultramontane candidates are Cardinals Bilio and Panebianco, the liberal, Ferrieri and Pietro. Papal elections, however, very often result in surprises, Germany will not interfere, and if a Liberal is elected Bismarck will seek an accommodation of existing difficulties. There is a strong probability that Russsia and Turkey will form an offensive and defensive alliance. The English Ministry has been sustained by a vote of 328 against 124, many of the prominent Liberals having abstained from voting. A portion of the English fleet has been ordered to the Bosphorus to protect British interests at Constantinople. The war spirit is very fierce in England; and all confidence in Russian moderation is declared to have been forfeited.

SUNDAY, Feb. 10.—The Silver men in Congress will force rapid action on the Bland bill, which will be passed probably within a week. Senator Kellogg of Louisiana, is said to hold the balance of power on the bill in the Senate, as without his vote it cannot get the two-thirds majority required to pass it over the President's veto. At Pittsburg, Pa., 12,000 men turned out in procession as a demonstration against the proposed change in the tariff favorable to free trade.

Russia declares that the dispatch of the British fleet to the Bosphorus restores to her liberty of action, releasing her from all the engagements made to England with regard to terms of peace. She does not regard this movement, however, as a *casus belli*, but will regulate her conduct by that of England. The Sultan and the Grand Duke Nicholas are to meet at Tchataldja, near Constantinople. The most earnest pro-Russian papers in England now approve the warlike action of the British Government. The 64th Regiment has shipped for Malta. The Russians have captured 120,000 men, including 20 Pashas, and 1,000 cannon during the war. The insurgents in Epirus have proclaimed their union with Greece; but the forces of the latter have been recalled, much to the dissatisfaction of the people.

MONDAY, Feb. 11.—Anderson, of the La. Returning Board, has a dispatch from Secretary Sherman, Stanley Mathews, Garfield, and other "visiting statesmen" earnestly protesting his innocence of fraud, and denouncing his conviction as an exhibition of sectional partizanship. Two colored jurors declare they brought in a verdict of "guilty, but recommended to mercy," against him because the other jurors told them this was tantamount to an acquittal. Both not over 22 years, one perhaps disqualified for juror on account of being too young.

The Turkish forces have evacuated Widdin, Rustchuk, Silistria, Belgradschik, and Erzeroum, and withdrawn from the outer defences of Constantinople leaving a neutral zone, 12 miles broad, between themselves and the Russians. Austrian and Italian war vessels are on their way to the Bosphorus, following British example. By former treaties no foreign war vessels were allowed to pass the Dardanelles. A war with England would be highly popular in Russia; but it is probable that before any hostile action is taken, Austria and Great Britain will wait to see the result as the proposed conference. In this Russia will insist on a reservation of certain points which will not be discussed. What these may be will probably decide the question of peace or war involving the greater part of Europe. Meanwhile, the Black Sea ports are all open, and an enormous shipment of grain will soon reach foreign markets. Garabaldi is alarmingly ill.

HOME NEWS PARAGRAPHS.

Montana, with fifty thousand people, reported not a single failure during 1877.

The Governor of California receives the highest salary among Governors, viz., $9,000

The Rural Clock speaks for itself (see page 107) though we hope every one of our subscribers will speak for it.

Sing Sing prison cleared six thousand dollars last month. It is a satisfaction to know business is good somewhere.

Thirty-four thousand Massachusetts women have petitioned the Legislature to allow women to vote at municipal elections.

Based on the average yield of the land in the United States, it would require the product of 4,000 acres in corn, or 6,000 acres in wheat, to fully load one freight steamer of a carrying capacity of 3,000 tons.

It is stated that the farmers of Clinton county, Iowa, during the past year have lost from 75,000 to 100,000 hogs from cholera, the loss in value reaching at least $500,000, and many consider that a low estimate.

Near York, Pa., lives a farmer who has kept a record of the number of tramps visiting his premises. From the 1st of April to the 18th of November last year, there were 545, or an average of about sixteen a week.

The total dividends paid last year by mining companies, banks, insurance and express companies, and other commercial enterprises on the Pacific coast, not including the Central Pacific Railroad, was $34, 366,000 an increase of $1,250,000.

The winter of 1829-30 surpassed the present one in mildness. Farmers plowed every month in the season, and no snow fell until Feb. 2. It was followed, however, be a cold, backward spring, with a snow storm in May which killed the returning swallows.

The State of Georgia lets out its convicts for $14 a piece to companies that furnish guards and employ the prisoners in mines or on farms. A contract has just been entered into between ex-Gov. Brown and the State by which the former agrees to pay the latter $500,000 in yearly installments of $25,000 for the use of all convicts for twenty years from April, 1879.

The coal production of the world has increased enormously since 1845. In that year Great Britain produced 31,500,000 tons; in 1874, 125,043,000; Belgium, 1845, 4,960,077; in 1874, 14,669,000. France, 1845, 4,141,617; 1874, 16,949,000. Prussia, 1845, 3,500,000; 1874, 41,754,600. In the United States the production in 1874 was nearly ten times that in 1845.

A statistical report to the Montgomery county (O.) Horticultural Society, on the 12th inst., shows that 880,000 acres in the State are in apple trees, yielding an annual average of 12,000,000 bushels; that the State averages 100,000 bushels of pears annually; and that 10,000 acres are in grapes, producing an annual average of 90,000,000 pounds, yielding 700,000 gallons of wine.

The wholesale slaughter of deer in the Adirondacks is going on this winter more recklessly than ever, and is arousing the indignation and alarm of all true sportsmen. The woods are full of hounds, and at least 100 deer were killed on a single river and its lakes last fall. It is estimated that, if this wanton destruction goes on unchecked, there will not be a single deer in all the Adirondack region in ten years.

The State salt manufactures at Onondaga, N. Y. which have been a source of immense profit to the State and the individual lessees of the works, have been steadily running down hill for some time past. Last year the expenses were $59,999, and the surplus only 49 cents, the annual manufacture is only half what it used to be and some change of policy is demanded which shall prevent the entire ruin of the business.

The Moffett bell-punch seems to be working out the financial salvation of Virginia, and is bringing into the State treasury from $400,000 to $600,000 per annum toward the payment of the State debt. There is a good deal of talk of introducing into other States, especially Kentucky, this method of registering every drink taken in every liquor store, taxing the same, and thus raising a large revenue while checking drinking to some extent.

There are fifty men in San Francisco worth from $1,000,000 to $25,000,000. Flood, O'Brien, Mackay and Fair, the bonanza men, represent one hundred millions of money, already accumulated, with the possibility of untold millions under their feet as they walk over the lower levels of the "Virginia Consolodated," the "California" and the "Ophir" mines. "Ophir," like a Kentucky ham boiled in Burgundy, grows richer as it is cut deeper down and nearer the bone. Leland Stanford, Charles Crocker, and David D. Colton, the Central Pacific railroad builders and principal owners, are worth from $5,000,000 to $30,000,000

piece. "Lucky" Baldwin, once a livery stable keeper, swore lately on the witness stand he did not know whether he was worth $8,000,000 or $10,000,000.

Happy tidings for nervous sufferers, and those who have been dosed, drugged and quacked. Pulvermacher's Electric Belts effectually cure premature debility, weakness and decay. Book and Journal, with information worth thousands, mailed free. Address PULVERMACHER GALVANIC CO. Cincinnati, Ohio.

FOREIGN NOTES.

England holds $700,000,000 of Turkish securities. One cause of her unhappiness.

Nearly 100 English and American teachers are employed in the schools of Japan.

A London paper estimates that during the latter 200 days of 1877, human blood flowed at the rate of forty gallons an hour.

Fifty-three persons were condemned to death in France during the past year, but only in fifteen cases was the capital sentence carried out.

The works now in progress at Chatham, England, will make the dockyard there the finest in the world. The work is chiefly done by convicts.

Canada exported to Great Britain during the year 1877, 8,412 cattle, 6,825 sheep, 373 pigs, and 298 horses. In 1876 the exportation was but 4,645 cattle and 4,218 sheep.

A letter from Ventnor, Isle of Wight, says: "The magnolia is in full bloom here; primroses and other summer flowers in blow; and last December a fine dish of outdoor green peas was pulled and brought to table."

That the Suez Canal is proving a success, is shown by the steadily increasing business it is doing. In 1875, 1494 vessels passed through, paying $5,777,269 in tolls; in 1876 the figures were 1457 $5,994,999; in 1877, 1663 and $6,552,279.

Great Britain paid to foreign nations for grain, cattle, and meat, during the year 1877. $484,398,685, while during 1876 the total was $435,646,930. Of the total in 1877, $315,961 120 was for grain, $86,568,370 for cattle and meat, $47,691,525 for butter, $23,815,268 for cheese, and $12,362,405 for eggs.

Frank Leslie, Esq., of the "Illustrated Weekly," says:—"For some time past I have been using BURNETT'S COCOAINE, and think it far preferable to anything I have ever used for the hair."

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Feb. 9, 1878

BEANS AND PEAS.—Receipts of beans past week, 970 bbls.; Exports, 6,100 bbls. The demand for mediums has somewhat improved, but buyers will not pay above $1.75, though some holders strive for $1.80. Marrows, as a rule, quoted as before. A small lot of selected brought $2.15. In Havana, Feb. 2, mediums were quoted at 26½@27 reals per arroba (25½ lbs.) Reals nominally 5c. U. S. Cur. White kidneys are quiet and favor buyers. Red bring late rates in a small way. Reduced rates for pea have given more movement. Black beans dull and unchanged. Green peas freely offered at $1.25. Southern B. E. peas too high for sales—$3.25 per two bushel bag. Canadian field peas quiet at 83c. for general stock.

We quote:—Beans, medium choice, $1.70@1.75; other, $1.55@1.65; marrows, choice, $2.10@2.12½; other, $1.85@2.00; pea, $1.70@1.85. White kidney, choice, $1.85@2.10; other, $1.55@1.95; red, choice, $2.60@2.85; other, $2.35@2.40. Turtle soup beans, $1.50. Lima, $5.

BEESWAX.—Small sales are exported at 27@28c. for Western and Southern.

Exports since Jan. 1, 15,775 lbs.; same time last year, 6,050 do.

BROOM CORN has increased demand and is steady in price.

Green brush at 6@7c.; green hurl, 6@6½c.; medium green, 5@5½c.; red-tipped, 4@5c., and common red, 3@3½c.

BUTTER.—Receipts for the week 18,132 packages. It is now undisputed that the best lines of State stock have been secured and are either here or city owned, and the market is consequently quoted higher for all table stock. The strength of the market is in choice Western creamery and selections of half tubs; though full dairies, firkins and market grades partake of the firmness. It is yet to be seen if the new scale of figures will be supported; as it is, no dealer is reporting a liberal style of outlet to consumers, and the times at present do not justify speculation. Firkins are sawed into half tubs by some sellers. It is better that this sort of alteration should be made here than in the country. Dealers know where they can be best placed and have the means of making a neater job of the method. Prime Western factory sympathizes with State and 21c. is readily given for nice quality. No dairy made Western of account coming. Shippers are looking about and seem to be willing to pay old prices now that the market has assumed some buoyancy.

We quote State creamery, 25@35c.; fancy pails, 30@32c.; other 25@28c.; creamery, good to choice, 25@30c.; half tubs, fine, 28 30c.; extra, 31@35c.; other, 22@27c.; Fall Welsh 27@29c.; Welsh tubs, dairy, 25@27c.; other, 20 23c.; full dairies, fine, 28@30c.; common, 20@24c.; firkins, 20@27c.; poor State, 14@21c.; Western creamery, good to choice, 40@41c.; poor to good, 25@32c.; factory, choice, 20@21c.; good, 16@18c.; common, 7@11c.; rolls, 12@18c.; grease, 6½@7c.

Receipts for the week, 15,635 pkgs.

Exports past week, 2,885 pkgs

CHEESE.—Strictly fancy factories have reached 11c.; there are so few of these last, that the general market is best represented in the quotations of average fancy factories, which are 12½@13½c. Shippers have been less inclined to purchase, but the stocks are more easily controlled, and there is confidence generally among holders of current prices.

Fancy factories, 13½ 13¾c.; good and prime, 13@14c.; fair lots, 12½@12¾c.; poor, 10@10½c.; 7@10c., skimmed. Farm dairy, 12@12½c. for good to prime; 10½@11½c. for fair lots; 7@10c. for skimmed; Western factory, cheddar, 13@13½c. for fine 11@12c. for good; 5@9c. for poor.

Exports for the week, 14,421 boxes.

Liverpool cable, 67s. Gold closes 102.

COTTON has felt the English needs, and has tended lower [illegible] closed rather firmer.

Latest prices are for February, 10.95@10.97c.; March, 11.05@11.06c.; April, 11.19c.; May, 11.32c.; June, 11.44c.; July, 11.56@11.57c.; August, 11.57@11.58; September, 11.31@11.33c.; October, 11.12@11.14c.; November, 11.08@11c.; December, 11@11.02c.

Quotations for spot cotton are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted.

Stained,

Good ordinary, 8½c.; Strict ordinary, 9¼c.; Low middling, 9⅝c.; Middling, 10 5-16c.

DRIED FRUITS.—Apples of choice grades have a good jobbing demand, but quarters and medium stock generally is slow; prices are steadily held. Peaches are quiet and nominal. Blackberries and small fruits generally hold to firm prices.

Apples—State quarters, old, 6@6½c.; new, 6@6¼c.; Western quarters, old, 6@6½c.; new, 5¾@6¼c.; Southern, new, prime sliced, 7c.; fair to good, 5@5½c. Peaches—Peeled, new, 10@10c.; unpeeled halves, 4½ 5c.; unpeeled quarters, 4@4c. Pitted cherries, 16@17c. Blackberries, 9@10c. Raspberries, 27c. Plums, 16c. and Southern at 10c.

EGGS.—Receipts for the week, 6,063 barrels. The market did not carry its high head long. Ever since Tuesday last there has been a steady decline, and the low prices of to-day are weak. Old stock is not looked at with the present rates for fresh, and the receipts are ample enough to more than fill the singularly small wants of the season. Ice-bound parcels are turning out badly; good limes are preferable to many of them.

Near points, 18@19c.; State and Pennsylvania, in good order, 16@17c.; Western best, 15c.; do. Southern, 15½@16c.; inferior and all quality, 10@14c.; State and Canadian, limed, 10@12c.; Western, 9@12c.

FEATHERS.—Live white prime Western geese, 45@47c.; mixed, 30@40c.

FEED.—Is more freely offered and easier. Sales 40 pounds ave. $17.50@18.00; 60 pounds ave., $17.00@18; 80 pounds ave., $18@18; 100 pounds, $18.00@20; and rye at $18.50@20.

FLOUR.—A much better export business has been done this week, and prices of grades below $6 in price have risen in price 10 to 20 per barrel. This improved position has been brought about by the advices from the other side indicating prolonged trouble there in regard to the Eastern question.

Latest prices are $3.90@4.75 for poor to fancy superfine State; $5.00@5.25 for common to fair extra do; $5.45@5.75 for good to choice do.; $3.80@4.75 for superfine Michigan, Indiana, Iowa, &c., outside for choice; $4.80@5.25 for shipping extra do., the inside price for poor, and $5.15@5.75 for good to strictly fancy extra do.; common to choice white wheat extras, $5.75@7.25; fancy do. at $7.25@8.25; red and amber winter wheat, good to choice family, at $5.10@6.75; round hoop Ohio at $5.10@5.50, and trade brands of do. at $5.75@7.00, the latter for choice; St. Louis, $5.50@6.25 for poor to fair extra and $6.25@7.50 for good to fancy, (with a few brands of very fancy quality quoted up to $8.00@8.25); Minnesota clear, $5.00@6.00; Minnesota "straight," common to fancy, at $5.65@6.50, and patent poor to very choice, $6.75@9.00, with a few fancy at $9.25@9.75; unsound stock at $2.50@6.25; city mill extra at $6.00@6.20 for fair to very choice for West Indies; do. for England $5.15@5.20; do. trade and family extras, $6.65@7.75; do. South America, $6.40@7.50; No. 2 at $2.50@3.75.

Buckwheat Flour—Quoted at $3@2.60. Corn meal is selling at $2.90@3 for Western yellow and $3.20 for Brandywine.

FRESH FRUITS.—Exports of apples past week, 1,350 bbls. This is a good-sized quantity, considering the strong advance that has obtained. Baldwins and Greenings, $5@5.50, though the latter must be faultless. Russets, $3.50@5; a few carefully preserved Spitzenberg, $8. Fine sweet are out of market. A few "Pounds" remain. Talmans sank badly. Cranberries are firm. Grapes have served their mission for the season—6@7c. for sound Catawba. Florida oranges firm for sound and showy—$3@6 ₱ case. Cranberries, fancy bls., $7.50@8; do. crate, choice, $2.50; good, $2.12@2.25; fair, $1@1.75. Peanuts have lost all of their recent firm tone. Best hand-picked Virginia, $1 35@1.45; good to fancy, $1@1.35. Hickory nuts, 75c.@$1.

FURS AND SKINS.—Low prices keep the market from becoming absolutely dead; buyers for mill furs for hatters' use being one of the main stays of the present market.

	No. 1 quality. Nor. & East.	West & N. W.

Wolf, mountain		1 50@2 00
prairie		50@60

GRAIN.—The news from the other side has been unusually exciting the past week in the possibility of England becoming embroiled in the Eastern troubles, and the markets here have been very feverish, standing at the close decidedly higher and active.

Latest sales are of No. 2 red at $1 26@— ungraded red and amber State, $1 10@1 40; white, $1 41; No 1 Northwest spring, $1 31; No. 3 Chicago, $1 20½; No. 2 red for January at $1 26; No. 2 Milwaukee spring, $1 28. Rye is a trifle steadier; sales of Western at 70@73c.; State at 73@7 c. Barley, 95c for No. 1 Canada; 86@93c. for six-rowed State. Corn is weak and quiet. Latest sales are of New York No. 2 at 50¾@51c.; steamer mixed, February, 51@51½c. Oats of New York extra white, at 34½@35c.; do. No. 1, Febuary, 35½c.; No. 2 white, 36@36½c.; mixed Western, 36@37½c.; white Western, 37@39½c.

HAY AND STRAW.—There is a good trade in medium grades and a fair shipping demand, with prices steadily held.

Bale hay, 65@70c. for shipping, and 75@85c. for retail qualities; clover, 40@50c. for prime. Straw, 50@60c. for long rye; 50@55c. for short rye, and 40@45c. for oat.

Exports since Jan. 1, 6,625 bales; same time last year, 5,050 do.

HIGHWINES are higher, on account of revenue agitation—$1.09.

HONEY.—Continues dull. White clover, 2-comb boxes, has sold at 13@14c., and good dark at 8@10c.

HOPS.—Exports for the week have been 3,600 bales. This shows a good trade, and prices have been well sustained. The only change in prices being for old and yearling lots, which are reduced 1@2c.

State choice to fancy, 11@13c.; good to prime, 8@10c; do., low and fair, 5@7c.; Eastern, new, 5@8c.; Wisconsin, do. 5@8c.; Yearlings, 2@3c.; Olds, all growths, 1@2c.; Californians, 12@14c.

LEATHER.—Hemlock sole, 20@22c. for light, 21@22½c. for middle, 21@22½c. for heavy, 19@20½c. for good damaged.

MAPLE SUGAR.—Ohio new or re-molded, 14@16c Very little inquiry.

OIL-CAKE.—Western is quoted at $31 ₱ ton.

POULTRY AND GAME.—The supply of live has been liberal and small prices, with the aid of wagon venders have kept the market pretty free. The authorities still keep city buyers from holding stock on their premises.

N. J. chickens, 7@9c.; W. fowls, 10@12c.; Turkeys, 6@10c.; Toms, 6@8c.; Ducks, N. J., pair, 87@$1.12; Geese, N. J., $1.75@2.00; Western, $1.12@1.37.

Dressed Poultry has arrived heavily and with fickle weather receivers have been anxious to sell. Freight Western unpacks badly and has to be named low. There are no large lots of fine quality. The demand is not general at this time of the year, turkeys have only a chance sale, while chickens sell steadily at fully as good prices. Ducks are scarce geese not wanted.

Fancy Phila. and N. J. turkeys, 13@14c.; good, 11@13c.; large or Toms, 7@9c.; chickens, choice, 14c.; good, 11@13c.; common, 7@9c.; ducks, choice, 13@15c.; other, 10@14c.; geese, fancy, 13c.; other, 7@9c. Capons large 18@20c. small and slips, 15@16c.

Fancy game is scarce and the relative high prices for quail and grouse give wild pigeons considerable activity. The scarcity of tame ducks gives more room for Norfolk wild. Grouse have advanced beyond ordinary use. Rabbits and hares are running out.

Hares and rabbits, pair, 30@37c. Canvas-back ducks, $1.25@1.50; red-heads, 75c.; Mallard, 40@50c.; Teal, 30@40c.; Quail, prime, $2.50@2.75; soft, $1.75@2.25. Partridges, pair, 75c.@$3c. Grouse, $1.37@1.50; poor, 90c.@$1.10.

PROVISIONS.—Hog products have reached the lowest prices of the season this week, notwithstanding the export trade is the largest ever known here. Mess pork, $11.25 for spot lots; $11.20 for February and March. Bacon at 5¾@5¾c. for long clear and 6c. for short clear. Lard—Western steam at 7-55c. for spot and February, 7.62c. for March, 7-70 for April, and 7-80 for May. Tallow at 7½c. for prime. Stearine, 8c. for prime Western. Beef hams at $16.50. Beef—New extra mess, $12.50@13.00; plain, $11.00@12.00; new packet, $11.75; family mess, $17.50; extra India mess, $27.00@28.00 for city brands; do. Philadelphia, $26.00.

SALT.—Ashton's at $2.50; Higgins', $2.40 and other sack lots at 95c.@$1.15; Liverpool ground, 65@75c.

SEED.—Clover, 7¾@8c. for Western; 8¼@8⅝c. for State. Timothy, $1.37½@1.42½. Rough flax, $1.55.

TOBACCO.—Export demand has been very fair and chiefly for low grades, for which full prices are made.

VEGETABLES.—Exports of potatoes past week, 2,177 bbls.; onions, 172 do. Retailers have been replenishing during the week, and the potato market has a semblance of activity. A few holders ask $2, but $1.87 is mostly quoted for choice stock. Chili Red, $1.87@2. Onions dull; garden stuff not active.

We quote Peach Blows $1.75@1.87, bulk and double-heads. Early Rose, $1.75@1.87; Peerless, $1.25@1.50; Nova Scotia, $1.50@1.75; Sweet, $1.50@2.50. Cabbages, 100, $2.50@4.50; red, 5@6. Marrow squash, bbl., $1.50@2; Hubbard do., $2.00@2.50. Russia turnips, 75@87c. Carrots, 75@87c. Beets, bbl., 75c.@$1.00. Red and yellow onions, $1.25@1.50; white, $1.25@1.75. Celery, doz., 75c.@$1. Hot-house mushrooms, ₱ lb., 20@40c. Radishes, 100 bunches, @$3.50 Lettuce, small, dozen, 75c.; large, $1.50@$2. Cucumbers, doz., $3@4. Rhubarb, doz., $1. Spinach, Southern, $1 12@2 bbl. Florida green peas, $6 bush.

WOOL.—There has been a very slow market, and prices are easier on fine grades, but otherwise quotations are unchanged.

Ohio, Pennsylvania and Virginia—XXX and picklock, 47@50c.; XX, 45@47c.; X, 42@44c; No. 1, 43@46c.; No. 2, 38@40c.; common, 35@37c.; combing, 50@55c.

New York, Michigan, Indiana and Wisconsin—XX, 39@43c.; X, 38@42c.; No. 1, 40@41c.; No. 2, 35@38; common, 31@33c.; combing, 50@52c.

Iowa, Vermont and Illinois—X and XX, 36@39c.; No. 1, 37@42c.; No. 2, 33c.; combing, 48@52c.

Missouri Kentucky and Tennessee—36@41c. for washed; 27@32c. for unwashed, and 33@38c. for unwashed combing.

LIVE STOCK MARKETS.

NEW YORK, Feb. 11, 1878.

BEEVES.—Receipts for the week, 9,037 head; do., last week, 8,444 do. There has been a brisk trade at all the yards, and prices close higher and stronger than on Wednesday last. There has been a better and steadier demand for beef at the stalls and wholesale slaughterers have purchased with more confidence. The pens at both Jersey City and Sixtieth street were all clear for Monday's market. Stock has arrived somewhat irregularly, as the roads still feel the effect of the last snow storm. Stock is arriving in very good average quality, and the fact helps to promote sales. Extra steers, 11@11½c.; good, 10@10½c.; medium to fair bunches, 8¾@9½c.; fat bulls, $3.40 ₱ 100. The highest rates were made at Sixtieth street. At Jersey City the top was 10¾c. No Texas cattle on sale.

COWS AND CALVES.—The demand is very light for even the best milkers, and the rough specimens that form the bulk of the supply are not looked at for local dairy purposes, while they are certainly not good enough for the hooks. No comprehensive rates to be given.

VEAL CALVES.—There were few fresh arrivals of live. Shipments from usual near points are retarded by roads that are soft one day and hubby the next. Rates for milk-fed New Jersey were 9c. for good to choice; other, 6@8½c.; grassers, 2½@3½c. Hog-dressed calves, fair to prime, 9½@11c.; grass-fed, 4@5c.

SHEEP AND LAMBS.—Receipts for the week, 20,659 head; do., last week, 18,581 do. Supplies are moderate for the season, and sales have been brisk, with more satisfactory prices. Good Canadian lambs, 7¼c.; mixed lots, 5@5½c. Quotations for sheep, 4¼@6½c.; Canadian ewes, 5¼@5½c.

SWINE.—Receipts for the week, 34,322 head; do. last week, 32,201. The offering was liberal at both yards, and the market weak at $4.50@4.65 ₱ 100. Country-dressed pork arrives lightly; heavy to medium State and New Jersey, 5@6c.; Western dressed, 4½c.; city, 5@5¾c.

Coughs and Colds.

"Brown's Bronchial Troches" will allay Irritation which induces coughing, and gives immediate relief in Bronchitis, Catarrh, Influenza, Hoarseness, Sore Throat, and Consumptive and Asthmatic Complaints. The Bronchial Troches have been steadily winning their way into public favor, until they are known and used nearly all over the world.

FOR ALL LUNG TROUBLES, as well as Complaints of the Throat, Dr. Jayne's Expectorant is certainly a palliative and often a curative, as the testimony of thousands and its world-wide reputation attests. For Coughs or Colds no surer or more effective remedy can be found.

Reading for the Young.

MUSIC ON ALL FOURS.

JOSEPHINE POLLARD.

A Pussy cat and a Black-and-Tan
Were shut in a room together,
And, after a season of quiet, began
To talk of the change in the weather,
And new spring fashions, and after that
They had a sort of musical chat.

Said Puss:—"To me it is quite absurd—
But taste and opinions vary:
And some have declared that no beast or bird
Can sing like the small canary,—
Who, if it be true as I've heard it told,
Is really worth more than its weight in gold!"

Said the Black-and-Tan, with a pensive smile:
"I've wanted to call attention
To this bit of scandal for quite a while,
And, if not amiss, to mention
That my daily allowance of bark and w(h)ine
Has greatly improved this voice of mine."

"It has," said Puss, with a comic grin;
"The words of truth you have spoken;
A name for ourselves we must strive to win
At once, now the ice is broken;
For one or two doses of catnip tea
Have had a wondrous effect on me!

'Twas only the other night I strayed
Where a silvery moonbeam slanted,
And gave such a beautiful serenade
You'd have thought the place enchanted.
It roused the neighborhood to a pitch
Of praise, or envy—I can't tell which."

Said the Black-and-Tan, "Why shouldn't we try
To sing a duet together?"
Said the Puss, "I see no reason why
We can't; and we'll show them whether
To birds and bipeds alone belong
The gift of singing a pleasing song!"

They sang—and they sang; but oh, my dears!
If you had been anywhere near them,
You'd have shut your eyes and stopped your ears,
And wished that you couldn't hear them.
'Twas a brilliant effort, upon my word,
And nearly killed the canary-bird.

The Pussy cat and the Black-and-Tan
With the music were so delighted,
They will give a concert as soon as they can,
And perhaps we may be invited.
"Bow-wow!" "Miaow!" I'm sorry, you know,
I've another engagement—and cannot go!

[*St. Nicholas.*

A FEW COMMENTS.

I see I have again to admonish my young relatives in regard to the way in which they send me *Mss.* Such letters as are interesting it gives me great pleasure to print, but you would be surprised to see the number of nice letters that go into the basket, mainly because I cannot spare the time to copy off what is written on the reverse of the page. Be careful to write on one side of the page only. Perhaps I am frequently accused of slighting you when the fault lies at your own doors.

I have here a handful of appreciative notes from my large family, which I shall give the gist of.

W. B. Lozer, is very complimentary. He says the RURAL is worth more than it costs. That is true, and I'll tell you why I know it. It costs more to make each paper than the money we receive will pay for. The reason of this is that we are making the RURAL better than ever before in all departments. This young gentleman also asks what others often mention, viz: that I shall excuse bad grammar, I don't like to hear such requests. There should be no necessity for them. See to it in the future and correct the fault by a closer application to your studies.

Now, here is Belle Bowmen, who sends me a slip of paper about quarter note size, written on both sides, and on the side an insinuating little note to Uncle True, saying that if Madcap Mollie sends her address to me to forward it. I have a number of such requests, and in many instances I should like to honor them, but how can I know that your parents would approve of your corresponding indiscriminately? I will

Propose a Plan

by which this much desired result may be attained, if it is to be attained at all.

Any of my relatives wishing to correspond with their "Cousins" may do so on condition that they send me the written consent of parents or guardians. I will then publish their request for correspondence, and if the other cousin is agreeable, I shall expect from that quarter a similar letter from parents giving their cousent to the arrangement. This accomplished satisfactorily, I will send the addresses to the applicants.

Here is a note "From The Mountains" asking information that I'm sure some of the cousins can supply. I give it entire.

"Will Lily Lu Randolph, tell a mountain cousin how she made the ornaments of pop corn for the Christmas tree, also directions for making brackets on glove-box. If Lillie Lu cannot tell of a pretty patch-work pattern, please, some one else do me the favor."

An Eastern Ohio girl, Florence Hawthorn, writes for the first time. She tells me all about how she looks except her complexion. That she adds, "would not charm any one," but I think this probably a subterfuge, and that there is undoubtedly one whom it charms.

I hope you are all doing your utmost with your studies at this season. I think some notes of school gossip, and what is being done for education would be [illegible] able to the cousins. Let us see. UNCLE TRUE.

LETTERS FROM BOYS AND GIRLS.

A Squirrel Hunt.

DEAR COUSINS:—Will you admit another into your happy midst? If you will, I will tell you how I spent Christmas.

A cold, damp mist hung over wood and hill-top as F. and I shouldered our guns and started on a squirrel hunt. Every limb and bough was white with frost; every breeze that rustled the tree-tops sent down a shower of glistening crystals. The woods were silent as we entered them, save now and then, the chip of a snow bird or the sighing of the wind. We stationed ourselves beneath the branches of a hemlock and listened. Soon we heard a noise in a neighboring tree, then a peculiar scolding and chattering, and then we saw the whisk of a gray tail. Presently a plump body came in view on the top-most branch of a hemlock. I heard the mulled click of F's. single barrel, at the same time I raised both hammers of my fowling piece. Out, out, further on the branch came the brisking tail; it stopped and a head appeared above the limb. *Bang!* went F's. single barrel and down came the squirrel—no, he has caught the limb of a small beech and is scrambling up the trunk. With a roar my old fowler asks him to stop and down he comes!

"Young Canadian" wishes to know how to trap squirrels alive. Make a box-trap in this wise: Take two boards eighteen inches long by ten inches wide, for sides; one eight inches wide by eighteen inches long for bottom; one board eight inches wide by ten inches long for one end. Nail these together in the form of a box without a cover. Now take a board eight inches wide by seventeen inches long, nailing this on to a piece eight by eight inches for cover and other end. Fasten the last so it can be raised by boring holes through the sides near the top and driving a nail. Bore a hole through the middle of the long end for the spindle. The spindle is simply a sharp-pointed stick with a shoulder so that it cannot slip clear through the hole.

Maple Glen. MENZER.

What is Thought of Them.

DEAR UNCLE TRUE:—I have been a silent spectator to all this sharp shooting for some time, and have now concluded to add my mite. Uncle True, if you will just give me an introduction to all these cousins I will begin.

Well, "Solomon Sap," you look *exactly* as I imagined you would, and *you*, "Slayerofconceit," are the very picture of—— Well, anyone would know what your name was, or what it *ought* to be. If you chose *your* own name you judged yourself well! But now for my little introductory speech. As I have said before, I have long been a silent spectator, and for all of what I have said concerning "Solomon Sap" and "Slayerofconceit," I have always looked upon them in the strife with favor, and as though they were to be pitied. Now, Cousins of the fairer sex I imagine I hear you say "Hush! If you knew them as well *we* do, you would *think* as we do." Well, perhaps that is so, but as yet I don't think so. "Madcap Mollie" and "Ivy" seem to be the only ones left on the field in the opposing army, and I think, "Bravo!" might well be said in their behalf. I am not sure but they will come out victorious yet, and possibly sometime *I* may join their ranks. Ladies have *such* a faculty for convincing people against their wills! But here I am taking all the time, (and the first attempt too,) with my worthy (?) opinion. Adieu. ATTEMPTS-AT-ELOQUENCE.

Wants Some Excitement.

DEAR RURAL COUSINS:—I hope you will not think my letter very uninteresting. I will try my luck, and if I do not get laughed at, perhaps I will try again. I presume some of the Cousins remember Carrie B. H.?—for I have written before. One of the Cousins was kind enough to answer my letter. If she wishes to correspond with me, I will send her my address, and she will do the same. I go to school all the time and study quite hard (but think I could study harder). I went away September 14, for a little trip. I went to Boston, Chelsea, Somerville, and Haverhill in Massachusetts; Durham, Dover, Portsmouth, and New Castle, in New Hampshire. I would like to hear from "Young Bach," if he is in the land of the living. I hope we have not scared him from our interesting column. I think the Cousins are rather quiet. I wish we could get up some kind of excitement this winter. I am willing to help if some of the others will start it. I think they are rather hard on "Slayerofconceit." I will take his part after this, and if there are any more sneers, look out for yourselves.

Camden, N. Y. CARRIE B. H.

Wishes They Would Write More.

UNCLE TRUE:—I thought I would write to the Cousins, as I should like to be one of them. I wish the girls would write more about fancy work, as I like to do such work. I have just finished a "tidy" on canvas, which is very pretty. My father has taken the RURAL for a number of years, and I like to read the letters from the Cousins very much. I hope the girls and boys will write more letters. I go to school, and am thirteen years old. I study seven studies, and like to go very much.

Will some one tell me how to fix autumn leaves?

Fort Atkinson. M. B. P.

From a New Cousin.

DEAR UNCLE TRUE:—Hawaii Nei said in one of her letters that she would like some of the Cousins to write and tell the Cousins how they spent Christmas and New Years. I, for one, will tell you how we spent those two days. We invited our aunts, uncles, and cousins to dine with us on Christmas day. We had roast turkey and plum pudding. After dinner, one of my uncles read the story of the "Queer Customer," which is in the dear old RURAL. We played games, and sang till 11 o'clock; then all went home, having spent a happy Christmas. New Year's we were all invited to our uncle's, to spend the day. There were fifty relations asked, and forty came. We had a grand time.

Now, dear Uncle True, I hope you will print this; if so, I will try again. I hope some of the Cousins will tell how they spent Christmas Day. We were sorry that Uncle True was not with us.

ESTHER BURNHAM.

Another New Cousin.

DEAR RURAL COUSINS:—As I have never written any letters to the RURAL I will attempt to write one. My aunt takes the RURAL and I have been reading the girls' and boys' letters. I like them very much, and would like to become one of the cousins. I am ten years old and go to school. I live in the country. I think it is all right to piece quilts. I pieced one when I was six years old, and another one when I was nine. The weather is very warm and it has been raining four days and nights. FANNIE L. FORSE.

Washington, Ind.

We Shall Know All About Toledo!

DEAR RURAL COUSINS:—I have been reading the RURAL for almost a year, and lately have taken more interest in the letter column. Therefore, this being my first attempt, I shall live in hopes, until the next issue comes, of seeing my letter published. If it is, I will write again, and tell the dear Cousins a little about Toledo, O. If ever Lottie King sees my letter, please answer through the RURAL. Age, 18; hight, 5 feet.

Toledo, O. ED. E. K.

No, Don't be Afraid!

DEAR COUSINS:—I have been reading, with considerable impatience, the girls' letters about "Solomon Sap" and "Slayerofconceit." So I will write to relieve my mind, and take their part. Now, girls, I do not see why you are so down on those boys. But never mind, boys; do not let them frighten you away. It is a trick of the girls to try to scare a fellow. SAM.

Collins, N. Y.

The Puzzler.

GEOGRAPHICAL ENIGMA.

I AM composed of 56 letters:

My 14, 12, 17, 24, 43 a town of Ireland.
My 48, 4, 3, 17, 16 a city of Afghanistan.
My 32, 9, 13, 6, 15 an island of Oceanica.
My 2, 31, 30, 45, 50 a county of Iowa.
My 37, 21, 46, 38, 6 a city of Nova Scotia.
My 8, 10, 23, 35, 43 a city of Egypt.
My 42, 6, 14, 5, 49 a city of Utah.
My 26, 45, 44, 50, 43 a cape of New Zealand.
My 17, 18, 55, 45, 40 a town of New Hampshire.
My 51, 27, 56, 1, 32 a country of Asia.
My 19, 20, 17, 11, 31 a country of Europe.
My 22, 14, 40, 25, 17 a town of Michigan.
My 32, 17, 47, 28, 41 a river of Portugal.
My 52, 33, 5, 35, 56 a fort of Kansas.
My 4, 29, 10, 6, 34 a town of New Hampshire.
My 36, 10, 43, 54, 12 a river of Siberia.
My 31, 17, 39, 7, 8 a color.

My whole is a gem of truth, culled from a garden of literary flowers.

PUZZLER ANSWERS.—Feb. 2.

MISCELLANEOUS ENIGMA.—It is far better to die a porter in the fear of the Lord, than a courtier in the fear of the devil.

DOUBLE ACROSTIC.—Initials, Maria Edgeworth; finals, Castle Rackrent.

Sabbath Reading.

THE ANGELS' GREETING.

COME to the land of peace!
Come where the tempest hath no longer sway,
The shadows pass from the soul away,
The sounds of weeping cease.

Fear hath no dwelling there!
Come to the mingling of repose and love,
Breathed by the silent spirit of the dove
Through the celestial air.

Come to the bright and blest,
And crown'd forever! Midst that shining band,
Gather'd to heaven's own wreath from every land,
Thy spirit shall find rest.

Thou hast been long alone:
Come to thy mother! On the Sabbath shore,
The heart that rock'd thy childhood, back once more
Shall take its wearied one.

In silence wert thou left:
Come to thy sisters! Joyously again,
All the home voices, blent in one sweet strain,
Shall greet their long bereft.

Over thine orphan head
The storm hath swept, as o'er a willow's bough:
Come to thy father! It is finish'd now;
Thy tears have all been shed.

In thy divine abode,
Change finds no pathway, memory no dark trace,
And, oh! bright victory, death by love no place.
Come, spirit! to thy God.

[*School and Home.*

PRAY ON.

I HAD a brother once, now more than a brother. He was wild, wayward, reckless. Elder brother as he was, and the natural guide of a younger, I could not look to him for an example of good. He loved the wine-cup, he loved the paths of folly and sensual pleasure. When a boy—for God showed His great mercy to me in calling me early to a knowledge of Himself—I used to pray for him often, with agony of soul. But on he went in his career of folly and sin, a burden and grief to his parents.

We grew up to manhood. Still prayer seemed unavailing. He had intelligence, ability; he might have been a useful, a happy, and a distinguished man. But he clung to his idols. At times indeed there was reflection, remorse, and a feeble effort to break away from his chains; but this soon passed, and he was as before. Prayer followed him still—the prayers and tears of a believing mother, whose heart swelled well-nigh unto breaking. But apparently there was no answer. He became a wanderer, went to sea, roaming in foreign lands. What he suffered we never knew. He returned destitute, wretched, a mere wreck of his former self; returned to a widowed mother, for our father had passed away. For a time he reformed, and hope again sprang up, and too soon to be dashed. His old habits resumed their wonted power.

Once more he goes forth; now to the distant west. Years pass, years of anxiety. Our mother, whose prayers, and patience, and hope never ceased, in a ripe old age goes to her gracious reward, her prayers unanswered, her hopes unrealized. But they were all laid up before God. Time in its ceaseless course rolls on. More than sixty winters whiten the head of that brother. Increasing infirmities warn him of the approaching end; yet he lives on without God, he turns in anger from every gospel appeal.

The ocean rolls between us; but on a foreign shore, to which God in His providence has called me, my heart anxiously turns to the loved ones in my native land. Shall the brother descend to the grave, having no interest in the great Redeemer? Shall he in the great day be the only one of this family circle who has no crown to cast at His feet? It seems like hoping against hope, yet prayer in his behalf ceases not. Letters come, the seals are eagerly broken. What do I read? Is it possible? Is prayer, after so many years of patient waiting, indeed answered? Yes; that brother, so long, so very long a wanderer, sits at the feet of Jesus, clothed and in his right mind.

Hope deferred maketh the heart sick: but when after years of waiting, hope is realized, what joy fills the soul! It is not always so. Henry Martyn when he gained that on which, during years of toil, his heart had been set, and appeared as senior wrangler in the university, exclaimed, "I obtained the object of my highest wishes, and found I had grasped a shadow." But a shadow is not what I grasp. Enduring as eternity is this joy that fills my heart—a brother born into the kingdom of God; a brother made an heir, a joint heir with Christ! Kingdoms may fall, cities may become desolate, earth may pass away, but his song of praise shall never cease. O my soul, magnify the Lord, who is indeed the hearer of prayer! Rejoice, for your joy no man taketh away from you. Poverty may come, toil may come, change may come, sickness may come, death may come; but this joy remains eternal as Jesus Christ Himself, the Author and Finisher of our faith. S.

WHEN a man goes from the sun, yet the sunbeams follow him; so when we go from the sun to righteousness, yet the beams of his love and mercy follow us. Christ first sent to Peter, who had denied him, and the rest who had forsaken him.

How deeply rooted unbelief must be in our hearts when we are surprised to find our prayers answered, instead of feeling sure that they will be so, if they are only offered up in good faith and are in accord with the will of God!

"The neatest thing I ever saw."

THE PATENT NAPKIN HOLDER,

Since its introduction, has met with an enthusiastic reception, and seems to meet a want long felt by every one. The parents buy it for their children, while gentlemen and ladies all over the country write, as soon as they receive and use the sample, that they "are so much pleased with it, they want more for themselves and friends." It holds a napkin or bib in place, so that the clothing is entirely protected. They are made of the finest quality of nickel silver, heavily plated with pure silver, and are connected with a heavy silk cord. They are also used very successfully as a skirt supporter, fastening on anywhere, and without injury to the most delicate fabric. The cut is shown one-half size, while that of the boy illustrates the method of use. Price per dozen, $3.00 by mail, postage paid; or a sample one will be sent on receipt of 25 cents. SPECIAL TERMS TO LIVE AGENTS, LADIES OR GENTLEMEN. Manufactured only by THE NEW ENGLAND PLATE COMPANY, New Haven, Conn.

"A necessity at every dining table."

Switzerland to America Greeting.

The Centennial Judges having awarded to the Messrs. BOREL & COURVOISIER 2 Prizes at the late Centennial Exhibition for their production, one for extreme accuracy in performance, and the other for Watches at a great reduction from improved machinery, whereby the cost of manufacture greatly reduced, insuring a first-class article within the reach of all. These NICKEL MOVEMENT WATCHES, so favorably known for the past 18 years, are made of the best material, and have all the modern improvements in watch making having **Chronometer Balances, Breguet Hair Springs, Tempered, Hardened and Isochronised for R. R. Travel, Fine Ruby Jeweled,** and are warranted to perform with the regularity and accuracy of a Chronometer. These Watches are for sale by all our local agents throughout the country, and parties desiring a good and durable time-keeper, are requested to examine them before purchasing those of other manufacturers or home productions.

Be sure to send for it before spending any money in newspaper advertising. Address N. W. AYER & SON, ADVERTISING AGENTS, Times Building, Philadelphia.

Wit and Humor.

SPARKS AND SPLINTERS.

BABY shows have proved disastrous ever since the one King Herod inaugurated.

THERE is one trouble greater than carving a turkey. It consists in not having a turkey to carve.

THIS sort of winter is rough on manufacturers of sleighs, dealers in furs, and the oldest inhabitant.

A GREEN Christmas makes a fat goat, for then the succulent old shoe and oyster can are not hidden beneath the snow.

IT will be very pleasant in 1881 to make a trip through Ohio, and hear the natives begin their remarks by saying, "When I was consul at——."

He stood on Afric's burning sands,
And smiled on Hottentot and Kaffir,
He said "I'm safe," and rubbed his hands,
When, lo! there stood a paragrapher!

AN old proverb says that "the anvil lasts longer than the hammer." This is probably the only consolation the undermost man in a fight has.

SOME prefer to have "clocks" on their stockings, but it seems to us that the mantle is the best place for them. Why we think so may be seen on another page.

Some soda water was heard talking to itself thusly to-day in one of our drug stores: "What place do I resemble?" "Why, the mouths of Misses sip I, of course." Applause from the glass holders and tremendous hissing from the fountain.

THE church debt raiser is now in New York. Until we announce that he is in Massachusetts, it will be safe for the pillars of the church to enter boldly, without squinting around the door post to see if there is a strange and business-like man in the pulpit.

A PROFESSIONAL base-ball player came forward in a recent revival meeting in Philadelphia and was "saved." Perhaps it would be just as well to drop this discussion as to the existence of a hell, since there doesn't appear to be any use for such a place.

"I CALL you darling," she said, as she leaned her head on his coat collar. "Show your hand," he returned mechanically. The young miss, not understanding his answer, continued to poker head against his chin, and he hove ace high of relief at her unconsciousness of his mistake.

If you dream of a Patagonian with the chills and fever, paying assidious court to a rheumatic lion with a pink polonaise draped gracefully over a point-aiguille tunic, cut bias in a dark night, it is a sign that you'd better wake up, for you are dreaming like a three-ply jackass.

HIS wife caught him with his arms around the hired girl's neck, but his courage even in this trying extremity never forsook him. "I suspected some one of stealing the whisky on the preserves, Jane, for some time, and of course you know her breath would have told if she was a guilty party."

AN Irishman, fresh from the "old country," saw a turtle for the first time, and at once made up his mind to capture it. The turtle caught him by the finger, and he, holding it out at arm's length, said:—"Faith, and ye'd better loose the howlt ye have, or I'll kick ye out of the very box ye sit in, be jabers!"

"Now," sobbed a devout North Carolina fisherman, as a passenger packet came crushing ashore in the storm and darkness, "Now," he exclaimed, raising his hands to heaven and falling on his knees, "Now, thank Heaven, my wife and daughters can have good clothes and jewelry to wear to church."

Some women love and praise their husbands. Said a Louisville wife the other day in a frank, honest way; "My husband is a smart man, yes he is. I never saw a smarter. Why, he has it fixed so that I can go to any store in town and run in debt as much as I please, and they can't touch a thing. But, of course, I wouldn't."

THE landlady brushed back the boughten curl from her alabaster brow, as she asked her favorite boarder on Christmas if he would have some of the spring chicken; and true to its name, the fowl sprung from the dull points of the carving-fork, like a rubber ball, into the lap of the young man with yellow pantaloons on. The spring chicken proved to be an infringement on the Goodyear patent.

AN Iowa man recently exploded ten pounds of gunpowder under a platform where two score cats, allured by a liberal spread of milk and bones, were having an oratorio by moonlight. There was a general feline transformation scene, a shriek that would have made the hair stand up straight on a billiard ball, and fifteen minutes later the cats organized on the roof of a neighboring woodshed, passed resolutions expressive of their sentiments, and then went on with the performance just as if nothing had happened.

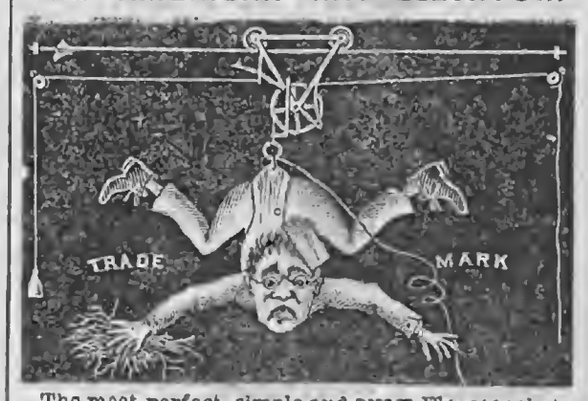
SELF-CONFIDENCE OUT SHOOTING.

NEPHEW—"Jump, Uncle! I'll clear you!"

"GET THE BEST."
Highest Award at the Centennial!
THE IMPROVED BLANCHARD CHURN
PRICE GREATLY REDUCED

Perfect stock, best work, very efficient and durable. Nine sizes made, churning from one to 150 gallons. Warranted to be exactly as represented. Sold by all dealers in REALLY first-class Farm Tools.
PORTER BLANCHARD'S SONS, CONCORD, N. H., Sole Manufacturers. Send for Circular.

THE AMERICAN HAY ELEVATOR.



The most perfect, simple and ONLY Elevator that raises the hay from wagon and carries it in barn any required distance. Economical, durable, labor-saving. Send for Illustrated Circulars and prices to
J. R. FITZHUGH,
1708 Barker St., Philadelphia, Pa.
Branch Office: 55 Beekman St., New York.

KNOX FRUIT FARM & NURSERIES
AT YOUR DOOR.
The GREATEST OFFERS of SEEDS, PLANTS and FLOWERS Ever Made.
☞ Catalogue and list of great offers free. Send for it.
GRIMES & GARROW, Pittsburgh, Pa.

PAT. CARBON PLOW.
RIGHT AND LEFT HAND.

THE HARDEST KNOWN SUBSTANCE THAT WILL SCOUR IN ANY SOIL.

The Carbon Metal is a practical mixture of refined steel, wrought iron and other metals, cast in form. *Harder than steel* or any surface-chilled iron. Combining great strength, great wear and durability. Subject to fine polish, and guaranteed to scour in any soil. Costs less than steel. Warranted to do good work in any land. See one! Try one! Buy one! If there are none for sale in your locality, send for full particulars to
REMINGTON AG'L CO.,
Manufacturers of Agricultural Implements, Ilion, N. Y.,
or 57 Reade St., New York.
N. B.—Also manufacturers of the celebraced REMINGTON PATENT STEEL SHOVELS, SCOOPS, SPADES, Etc. Also, Right and Left-Hand Steel and Grey Iron Plows.

CHEESE VATS.
We continue to manufacture Steam Boilers and Engines and all kinds of Cheese and Butter-making Apparatus, combining the latest improvements. Send for Illustrated Circular and Price List.
CHARLES MILLAR & SON, Utica, N. Y.

SEEDS.
All the leading and most desirable kinds of
VEGETABLE, FIELD,
AND
FLOWER SEEDS,
will be found in my new priced lists. Mailed free.
ALFRED BRIDGEMAN,
Broadway, cor. 18th St., New York.

TEXAS ALMANAC FOR 1878,
Containing 200 pages of information about Texas, with new map of Texas. Price 75 cents. Address J. BURKE, Jr., Publisher, Houston, Texas.

THE THREE POTATOES
EARLY OHIO.—Earlier than Early Rose. Ranked by general consent, in earliness, yield and quality combined, at the head of all the early potatoes.
BURBANK.—Medium late; a prodigious cropper; flesh remarkably white; quality excellent.
DUNMORE.—A splendid late sort. A greater cropper than the Peerless, which it resembles in form, while far better in quality.
Each, per Barrel, $4.00; per Bushel, $2.00; per Peck, 75 cents.
My Illustrated Seed Catalogue *free* to all applicants.
JAMES J. H. GREGORY, Marblehead, Mass.

EARLIEST TOMATOES KNOWN.
BLISS' LITTLE GEM.
Numerous testimonials received from those who tested this variety the past season, pronounce it two to three weeks earlier than any other variety. At the great Tomato Trial in London, at the Horticultural Society's gardens, it was the earliest of 60 varieties on trial, and received a first-class certificate. 15 cts. per packet.
ACME.
This new and beautiful variety is one of the finest ever produced. Its rosy-purple, glossy skin, fine, symmetrical form and delicious flavor, render it worthy of general cultivation. It is also a very early variety, surpassing all others in this respect, excepting the "Little Gem." 15 cents per pkt.; ½ ounce pkts., 75 cents.
A Descriptive List of our Novelties for 1878, will be mailed free to all applicants. Address
P. O. Box No. 5712. B. K. BLISS & SONS, 34 Barclay St., New York.

GUNS and Revolvers. Illustrated Price List free. *Great Western Gun Works*, Pittsburg, Pa.

J. M. THORBURN & CO'S
SEED WAREHOUSE
15 JOHN ST., NEW-YORK.
NEW DEPARTURE.
At the solicitation of many of our friends, we this season publish our Catalogue of Vegetable, Agricultural, Flower and Tree Seeds, together with all the Novelties of the Season, under one Cover, free to all on application by mail.

Sheep Husbandry.

HORNED SHEEP.

THERE are several varieties of horned sheep still extant, but all the most renowned breeds which are eagerly sought after in every part of the world for their mutton and wool combined, have long since lost all trace of horns. Indeed, it is not at all improbable that by the close of another century, few choice cows will be found with these useless and dangerous appendages.

The Dorset sheep is probably the best horned sheep in existence at the present day. In the neighborhood of London, England, they are used for raising lambs at seasons when it is unusual for other breeds to have young. Animals of this strain, however, will breed the year round at any time that may be selected, and will drop lambs twice every year. A few farmers in Dorsetshire and a few in Somersetshire are, we are informed, now breeding animals of this horned variety, with a view to their improvement so as to establish them as a standard breed. But had it not been for their great fecundity, and their capacity for breeding again immediately after yeaning, and so producing lambs at any time of the year when desired, so that very early lambs can be had with certainty, they would probably have by this time been unknown. The recent improvement effected in them, however, has made them valuable for wool and mutton, independently of their dropping lambs at whatever season the owner may wish.

There are in England, Wales and Scotland, other breeds, also, of horned sheep; but they are much smaller in size and are, some of them, almost as wild as deer, and, like them, generally found in forests; while others, like our own Rocky Mountain sheep, are extremely active, and can climb almost as well as goats. The flesh of some of them—notably of the Welsh Mountain sheep—is sold at a high figure, and is said to have a flavor in some respects more palatable to the epicure than that of Down mutton, because it savors in some measure, of the taste of game or venison. Indeed, a saddle of mutton from one of these semi-wild sheep, is said to be second only to a haunch of the best venison.

BREEDING EWES.

WHILE there are reports and complaints of bad results with ewes and lambs, those that are rightly managed and have good, succulent food, are doing well. On Houghton Farm there is an English shepherd in charge of a flock of rather more than 100 ewes, composed chiefly of grade Merinos with a few pure-bred South-Downs. A pure-bred Down ram was with the whole of them, and there are already about sixty lambs, while others are coming daily. Some of those which came first are now as fat and plump as possible, the ewes being very healthy and giving abundance of milk. They will be fit for the butcher when they are eight weeks old. Should the treatment be as good as heretofore, the nutritious diet be continued, and the other fifty-two ewes have as good luck as those which have yeaned, there will be a fine show of lambs; for at the present time not one has done amiss, every ewe having had a lamb or two.

These will have the genuine flavor of prime, first-class lamb, and will not look like the poor miserable creatures so often to be seen hanging at the butchers' with the "kells" of old sheep wrapped around the skeletons to make believe they belonged to them. If farmers would feed some oil-cake with some oats and bran, too, the ewes would require much less hay and they would be able to send to market mutton and lamb as ripe and palatable as it is in England. This would induce the upper class and the public in general to consume so much more mutton in comparison with beef that the demand would increase and the price would be always remunerative.

If these ewes had been given some stimulant in August, they would all have had lambs in January, and these would have been worth from $10 or $15 each when they were eight weeks old. The English lambs coming first of all into market are, a good deal of them, not more than six weeks old, but they are very fat and have the exquisite taste peculiar to the meat when the lamb has had all the milk it could take and has eaten no food besides what it sucks. First-class butchers would buy neither veal nor early lamb if either calf or lamb had tasted anything besides milk. What is called lamb by second-class butchers in the United States is in reality young, washy mutton. The proprietor of this farm is feeling his way and experimenting with good, common stock preparatory to procuring such pure-breds as his experience with the present animals shall prove will be most suitable for his purpose of inaugurating a new era in agriculture.

January 20th. GEO GARDNER.

Farm Economy.

GROUND BONE—BONE MILLS.

IN the RURAL of Dec. 29, several questions are asked, and others suggested, that are of much interest to farmers generally at this time, and need to be more fully answered or discussed.

The value of ground bone as a fertilizer, and how it compares with superphosphate—on what soils and for what crops is it most valuable, and by what means can bones best be pulverized or made available as plant-food?—are questions that hundreds of our farmers in this north-eastern section of Ohio, are seeking to gain light upon at this time, and topics that are frequently discussed at meetings of Farmers' Clubs and Granges.

It has come to be quite generally admitted that the fertility of the soil in these old-settled districts, has gradually declined, and something

HORNED SHEEP.

more is needed to keep up or restore fertility than is supplied by the usual rotation of crops and occasional manuring. It is also beginning to be admitted, as the result of many experiments, that the element most generally wanting in our clayey or loam soils, where grass and grain are the chief products, is *phosphoric acid*. This idea is also quite in accordance with the teachings of science—that this element was essential to fertility, and was not over-abundant in our soils naturally, while at the same time it has been carried off continually in wheat and milk, as well as in the bones of animals. Of course, nitrogen (or ammonia) is also wanting in these worn soils; but this can be supplied by increasing the manure pile, as many farmers are doing.

Then the question arises: Can the phosphoric acid be most economically supplied in the form of superphosphate, or of pure ground bone? Most writers on these topics have asserted that plant-food, in order to be available, must be in a soluble form; and as the phosphate of lime in bones is not counted soluble, except in a small degree, it is thought to be too slow in its effect as a fertilizer, and hence should be treated with sulphuric acid, which separates the lime from the phosphoric acid and leaves the latter in a soluble state, readily available as plant-food—while the sulphuric acid and lime form sulphate of lime, or plaster, and the whole compound is sold under the name of bone superphosphate. If the gelatine of the bones, which is first separated by steaming, is returned to the compound, as is commonly claimed, it produces from three to five per cent of ammonia; and with this alone, or the addition of flesh and blood, or poorer materials, the compound is called "ammoniated superphosphate."

If the articles commonly sold to our farmers as superphosphate, were honestly such, or were only slightly adulterated, we should have less cause to complain than now, and it might be found true that for some purposes—as where only the crop of the first season is cared for—this may be the best method of fertilizing; but of this I have my doubts. Many farmers are grossly deceived in supposing that a so-called superphosphate is a good article because it is darker colored than one having a full share of bone, and has a strong odor of ammonia, when in reality it is composed of flesh, blood and slaughter-house filth, with so little bone as to render it undeserving the name of superphosphate, and not worth a quarter of the price asked for it.

SALE OF FERTILIZERS AND THE LAW.

The use of these fertilizers will greatly increase if such laws are enacted as will protect the farmers from imposition in their purchase; and, of course, this will prove of benefit to honest manufacturers. Let it be required that all the packages shall be distinctly marked with the percentage of the different elements deemed of value, and the farmers would not only be thereby protected from fraud, but they would also be greatly aided in deciding what kinds of fertilizers to use for different soils and purposes. As soon as our people begin to realize the importance of this subject, or the magnitude which the trade in commercial fertilizers will shortly assume, the needed legislation will, no doubt, be secured. As Connecticut has led the way, we look to New York and Pennsylvania to follow, then our turn will come.

QUESTIONS FOR THE AGRICULTURAL CHEMISTS.

From my own experience and the results of many other experiments that I have observed, the past year or two, I am of the opinion that most of us have been too hasty in adopting the belief that the best form for using bone material as a fertilizer, is that of superphosphate—or that bone, especially when finely ground, is not speedily available as plant-food. If this is all a mistake, it is one of great importance. Besides the door which it opens for deception and fraud, as before stated, there is an obvious waste of money or materials in the manufacture and purchase of superphosphate, if the supposed necessity for the increased solubility of the phosphoric acid is a mistake. A ton of good average superphosphate, costing say $40, contains only about twelve per cent. of phosphoric acid; whereas, a ton of finely ground bone contains twice as much, or twenty-five per cent., while in each there is about an equal amount of ammonia. The remainder of the superphosphate is mostly sulphate of lime and water, and that of the bone mostly lime, with which the phosphoric acid is combined.

Now from the results of a large number of experiments, I am convinced that by means of the carbonic acid and water in the soil, combined with the vital action of the roots—*vide* Johnson's "How Crops Feed"—these small particles of bone are dissolved and assimilated as speedily as wanted by the growing plants. Of the many facts that I could give in support of this belief, I have only space for the following, and it is most directly in point; because the crop is one of the quickest growth and maturity.

RAPID EFFECTS OF GROUND BONE.

Messrs. HOUGH & SON of Rootstown, Portage County, O., had five acres of clay loam soil, which they decided to sow with buckwheat. They knew that the land was poor, but having no fertilizer excepting one barrel (250 lbs.) of bone dust from the Salem Mill, they applied this broad-cast on one-half the field—only 100 lbs. per acre—and harrowed it in with the seed. The field was all alike in other respects—sowed the last of June—the ground in fair order, and rain enough followed to bring the plants up in due time. Almost immediately after their appearance, it began to be seen that the plants on the fertilized half of the field were more vigorous than the others; and this difference increased as the season advanced, the growth of the one side being fully twice as great as that of the other; and at harvesting the fertilized portion gave fifty-six bushels of nice grain, while the other half was not worth cutting, and only gave six bushels.

I found numerous instances where this bone-dust had been used by the farmers of Columbiana County, not far from Salem, with excellent results, when drilled in with wheat and grass seed, greatly benefiting the wheat-crop and securing a fine catch of grass and clover. Also applied on meadow and pasture land, a well-known dairy farmer in Geauga County used several tons of the bone with very satisfactory results, where he failed to see any benefit from a supposed fair article of superphosphate, applied at the same time as the bone, and at the same rate of 200 lbs. to the acre. I will give his address to any one who desires it.

Most of the experiments with superphosphate that I have observed, have been with corn, which needs ammonia more than phosphoric acid, and in a majority of cases there has been obvious benefit, in giving the plants a start in the first part of the season; but if the land was not otherwise enriched, the growth stopped when the roots got away from the influence of the fertilizer, which had been dropped in the hills, and hence it did not help in the earing time. Of course, a larger application is required for poor soil, and it needs working in broad-cast. I found the same true in regard to its use for garden crops; and there was no perceptible benefit the second year, even when freely applied, unless the first season was dry. The bone-dust applied at the same rate was more lasting, showing effect the second season, as well as the first, if at all freely used.

Another question for the chemists is this:—It is a fact, I believe, that phosphoric acid will not remain in a free or soluble state when in contact with any alkaline base—as lime or magnesia—with which it can unite; and although its affinity for lime is overcome by the greater power of sulphuric acid, will not that affinity cause it to again unite with the lime that is in the soil where it is applied and thus again form phosphate of lime as insoluble as it was in the bone, before it is likely to be found by the roots of plants? Or, if lime is not present, which is seldom the case in Ohio, magnesia may take its place. This question I have never seen answered, and it is plain, I think, that it is of much practical importance, affecting as it does, the fundamental principle of the value of superphosphate as compared with simple bone for fertilizing.

ABOUT BONE MILLS,

or machinery for pulverizing bones, most persons who have undertaken the work have found serious difficulty; and, as I have hinted, much of the objection that bone-meal is slow of effect as a fertilizer, is owing to its being coarsely ground. I have seen samples of the meal from at least half a dozen different establishments, East and West, and nearly all of them had the particles averaging as large as wheat grains, some larger. And these were as fine, I believe, as bones can be ground by any of the iron or steel mills which have been constructed for the purpose. The contrivances for pulverizing by means of friction or attrition, are found expensive and unsatisfactory. The mill at Salem, O., is the only one within my knowledge that produces a really fine article of meal from pure raw bones, without any previous softening or driving off the natural gelatine which adds to the fertilizing effect. I visited this mill last September, and was greatly interested in learning from the farmers of the region, how much benefit it was doing in the way of stimulating thought and increasing the fertility of the lands. The mill was then running night and day, producing five or six tons of meal every twenty-four hours; but this was not sufficient to meet the demands—so much of the article was being used for wheat sowing.

The bones were obtained from nearly all parts of Ohio, and some from other States—occasionally from the Western plains—and delivered by rail-cars within a few rods of the mill. All the preparation they required was the sorting out of such as were too wet or greasy—these being deposited in an open yard and simply exposed to the weather for a month or two. A powerful steam-engine is used, and the bones pass through several different kinds of grinding machinery, part of which is of the ordinary kind and of the strongest pattern, and part is of Mr. SHILLING'S own contriving, and which I am not at liberty to describe.

One question more. Is there not a mistake in the article in the RURAL to which I have referred, [Dec. 29] quoting BERZELIUS, stating that ox-bones contain 33.30 per cent.—or one-third their weight—of gelatine? I have not the book at hand, but I think this cannot be correct.

Painesville, O. M. B. BATEHAM.

[THE proportion of bone gelatine in ox-bones—33.30—as given in our answer to a correspondent's question in the issue of the RURAL referred to by Mr. BATEHAM, is quite correct, according to analysis of BERZELIUS. Should the works of that chemist be inaccessible to any curious reader, he will find a quotation from them of this analysis in "Appleton's Cyclopœdia."—EDS.

COTTON SEED.

PROF A. W. MANGUM.

SOME time since I wrote you that many people in the cotton-raising territory, utilize the seed of the cotton by feeding it to cattle. A poor man, who rented a house from me last winter, told me that he did not regard the expense of feeding his cow in winter, as he gave her nothing but cotton seed. The cost, in this place, is 12½ cents per bushel. The quantity given is from half a gallon to a gallon, at a time. I have sometimes used the seed for my milch cows, regarding them as a valuable addition to other kinds of feed. They may be fed alone, or mixed with slops or meal. Large quantities are said to be injurious both to cows and hogs. I have heard that hogs have died from eating too great a quantity at once.

A farmer, from whom I have regularly purchased butter, explained the absence of the desirable yellow color in winter, by stating that he was not feeding meal but simply cotton seed, in addition to the rough provender. Of course, the butter was not so valuable; still it was not what we would call poor.

But the seed can be much more extensively utilized, according to statements recently published in the organ of the Board of Agriculture in North Carolina. It is from the pen of W. H. OLIVER, Newbern, N. C. He argues that the seed may be so manipulated as to sell for as much as one-fourth of the entire cotton crop. He estimates that each ton of seed will make thirty-two gallons of oil and 700 pounds of oil-cake. The crude oil is put at 40 cts. per gallon, and the cake at $25 per ton. For both of these there is an immense demand, great quantities of the cake being shipped to Europe. He claims that feeding the cake to stock fattens them, and increases the quantity while improving the quality of the manure. Of various kinds of feed compared, the following sufficiently indicates the superiority claimed for what he calls the "cotton-seed meal:"

	Flesh producing.	Fat producing.
Hay	8	50
Oats	12	63
Corn	12	68
Linseed Cake	26	56
Bran and Mill Stuff	31	51
Cotton-seed Meal	41	77
